## U.C. Farm Expert says-

**"Wood blocks make a very desirable floor"**

Professor J. B. Davidson of the University of California, College of Agriculture, says:

"Wood blocks make a very desirable floor when well laid, either of durable wood or a treated wood, especially for that part of the floor upon which the animal is required to stand. The use of wood blocks obviates to a certain extent the use of a liberal amount of bedding where the animal must lie on the floor."

## California Redwood

Resists rot and fire

Redwood block paving is especially desirable—contains a natural preservative. No creosote or artificial preservative is necessary to increase Redwood's durability. Redwood block paving resists wet and dry rot, is permanent in shape and will last a life-time.

Redwood block paving is not expensive.

Write for free booklets, "Redwood Block Paving" and "California Redwood on the Farm."

## Grapes Under Standardization

Address of A. L. Rutherford of Stanislaus County Before the Horticultural Commissioners at Modesto. The New Law Will Prove Invaluable to the Grape Industry

ANY years ago, when fresh grapes were shipped to eastern markets, remunerative prices were obtained.

The grapes were of fine quality and much care was exercised in the packing. These good prices stimulated planting, so with each year large acreages were added to the industry until the market became somewhat overstocked.

Prices began to decline and this caused growers and packers to become less careful in both the growth of fruit and in the pack. So the business went from bad to worse until the railroads and packers were getting all that was to be made. The packers were getting their price for packing, and the railroads were charging the same freight, so they kept encouraging the growers to continue picking and delivering to the packing houses, even though the growers were not getting pay for the hauling.

During this time of general bankruptcy there were a few farmers who had not lost the art of putting good, clean fruit on the market, and they continued to receive prices that justified the expense and trouble. The prices which these people obtained were held up to the rank and file of growers to encourage more shipments. At last the time came when the fresh grape shipments would have to cease or the growers would have to assign, and it was not until

then that growers attempted to help themselves.

Committees of investigators were sent out to see what might be done. These investigators developed the fact that good ripe fruit was yet commanding good prices, so it was decided that only clean, ripe fruit should be shipped.

### First Legislation

Then it was that our farmer legislators in 1914 got their heads together, framed and passed a standardization law to control the quality of fruit shipped. This law, although somewhat lame, did wonders towards restoring profitable prices. Two parts of the section of the law provide that all fruit shipped must be practically free from insects and fungous diseases, and that grapes shall show at least 16 and 17 per cent Balling scale. These are the main features of the law of benefit to the fruit grower.

### Inspection

In 1915, when the law became operative, it was quite a serious problem with the different horticultural commissioners to determine just how to proceed. I put my machinery to work, then slipped down to Fresno, then to San Joaquin County, to see if my system of inspection could be improved, but to my surprise I found both Fresno and San Joaquin doing just as I had planned.

The task was so expensive, with

insufficient money available, that it was out of the question to put an inspector at each of the packing houses. So the next best thing was done—that was for the inspectors to visit each packing house one or more times a day, as the demand might require, and not at any particular hour. Often two inspectors would have overlapping territory, so the packers would not know where or when to look for an inspector. Then the commissioner made it a point to visit each packing house every other day, if not oftener. The commissioner and each inspector were provided with a Balling scale testing outfit, and these were used whenever there was any suspicion of the fruit not being up to the required test. Mildew and insect diseases were carefully looked after.

The word "practically" in the sentence (practically free from insect and fungous diseases) was the cause of much discussion. The packer would insist that where there was but a slight infestation of mildew the grapes were practically free, and again the packers would put up two grades for shipment, one for local and the other for foreign or interstate shipment, so it was not always possible to know just where the grapes were to be shipped.

### Benefits Realized

Most packing firms and the packers took pride in putting out a clean, fancy pack. There were others who

only cared to get out quantity, and not until a few packed cars were turned down and threats made of arrest did these packers come to understand that their packs must conform to the requirements of the standardization law in every possible way.

During the season of 1916 there was a decided improvement over the pack of 1915, due to the growers using greater effort to subdue the mildew, waterberries and prohibiting the gathering of under-ripe fruit. And most all packers had learned that it was to their interests, as well as to the interests of the growers, to send forward honest packs. Consequently last year it required less vigilance on the part of the inspectors to obtain a better pack.

### New Law

During the past session of the legislature the promoters of the first standardization law, with the state commission of horticulture and the different horticultural organizations, framed and passed an amendment to the law, which our governor has seen fit to sign. This law, relative to grape shipments, affords some improvement, opens the way to produce splendid results, and promises the restoration of early day prices to the grape owner.

Standardization and organization is the keynote of prosperity to the farmer and the fruit grower. Let the good work go on.

## War's Challenge to the Poultry Keeper

Mrs. Jean A. Koethen Writes for Cultivator Readers from Practical Experience of Things to do with Poultry in These Troublous Times when Wheatless Days and Meatless Days are Necessary for Poultry

IT does not come to every generation, but now and then to some generation there comes a crisis that compels radical change in habits of thought. We are fortunate, perhaps, that our generation must face such a crisis and force itself, willy-nilly, out of its rut. Like little Dorothy in "The Wizard of Oz," we have been caught up in a cyclone and now must adapt our lives to suddenly changed conditions. How foolish we are if we hide behind that flimsiest of excuses, "I don't believe in war," as if that had anything whatever to do with the case. Whether we believe in it or not, the country is at war, and we must for once forget ourselves, forget our own tastes and inclinations and our preconceived notions of what the world owes us and do our "bit" in the place where we are.

Hitherto the first and often the last question asked about backyard poultry keeping has been, "Does it pay?" We must tear ourselves loose now from that commercial issue. Keeping chickens in a small way will

probably pay as well as it ever has paid in dollars and cents, but it will pay still more in other and more important ways. "Poultry," an English publication, said recently: "While stimulating the efforts of the large farmers and breeders who are the backbone of the industry under present conditions, we have realized that the salvation of the national egg supply rests mainly with the masses, who by keeping a few hens and raising a limited number of chickens according to their accommodations can meet their own domestic requirements and possibly assist their neighbors who are not so well situated. Poultry keeping is the most accommodating food producing industry. You can keep hens where you cannot grow potatoes or feed a pig. . . . There is not a back yard or a garden in the British Isles where a few hens could not be kept with substantial profit, simply by exercising ordinary care and intelligence in the provision of accommodation."

If this is true in England, where feed must be husbanded with extraor-

dinary care, how much more true is it in America, and especially in our own California, where hens are kept with a minimum of housing and where green feed may be grown eight months of the year. Still more emphatic are the closing lines of this editorial: "The war has made poultry keeping a national necessity and a universally popular household industry. Let us see that we develop its opportunities now and always to the best of our ability."

If poultry keeping is a "national necessity" in England, is it not a good plan for us, who have as yet not felt the pinch of war conditions, to put our shoulder to the wheel, stop complaining about feed prices and do our very best with what we have? Most commercial poultry men, I believe, are doing this very thing. In my visits to poultry plants in and about Los Angeles I have been surprised at the optimism displayed by everybody. Unprofitable stock is being culled out more carefully than ever before, feeding problems are being studied with renewed enthusiasm, more feed will

be raised on poultry farms than has been thought possible. Last week at one of the University of California poultry schools, which are now held every summer in Southern California, an enthusiastic crowd gathered on one of the hottest days in years to discuss poultry problems and learn better methods, and I did not hear one single person ask if poultry could be made to pay. They knew it could, every one of them, and were bound to find a way.

One poultry association recently passed a resolution advising novices not to try to enter the business under the present conditions, and this was both wise and sensible. Poultry keeping as a commercial venture is not for the novice, and it is quite time he understood it. But everybody ought to keep hens, and a few hens carefully kept will do their full share in keeping the family.

Whether or not the salvation of our national egg supply may ever come to rest mainly with the side-liner, as it does in England, we do not know.

Continued on Page 18.

## Selecting Buds

WING to the large number of "boarder" trees in nearly all citrus orchards live orchardists are working over tops of such trees, using buds from tested trees and the fruit bearing wood on those trees. Some call these trees "pedigreed," which term is not permitted by some others. However, the idea is the same, that trees known to be heavy bearers of high grade fruit should be used not only in working over the orchard but in budding nursery trees which are to be used for planting. From observations made by A. D. Shamel, expert physiologist of the bureau of plant industry, 25 per cent of California's citrus trees are unprofitable. This is an awful waste which has been appreciated and stopped by some orchardists, and with

the present movement toward conservation of energy and conservation of resources the impressing of this lesson on all should be easy.

Mr. Shamel adds that this 25 per cent loss means an average of \$100 per acre. Mr. Shamel has been studying for years the variations in citrus varieties and the possibility of improving these varieties through the elimination of inferior strains. He adds:

"The plan of our work has been to cooperate with the grove owners in keeping individual tree records in selected plots of each of the important citrus varieties. The results of our work have shown that not less than 25 per cent of the trees in our plots have been unprofitable and undesirable. From tree census observations

in many orchards it is evident that California citrus orchards average more than 25 per cent of trees that are of inferior strains and bear light crops of poor quality.

"In our performance record plots the actual losses due to the presence of these undesirable bud sports has amounted to approximately \$100 per acre every year. We believe that this is a fair and conservative figure, and shows the average loss through low production and inferior commercial quality in California citrus orchards as a whole. Individual tree records are of value to the grower in enabling him to discover drone trees to be top-worked with reliable buds or to be replaced with pedigreed trees. We believe that records for two successive normal seasons are sufficient to enable the grower to locate his drone trees."

This work as conducted by the de-

partment has resulted in the furnishing of more than 2,000,000 buds to growers for top-working of established orchards and for nursery stock. In order to extend this work and make it of greater value the Fruit Growers' Supply Company has arranged with owners of orchards which have been tested for a period of years, and on which records of production both as to quantity and quality have been kept, to supply these buds for its members. Not only will good orchards be chosen but good trees in such orchards and bearing wood only will be supplied. That is, the wood chosen must carry fruit at the time the bud stick is cut. A price will be made which will cover simply the cost of expert work. Mr. Shamel and experts of the department of agriculture will aid citrus growers in every way in determining the trees in their orchards which should be eliminated or worked over. C. S. Milliken will have immediate charge of this feature of the work so far as the company is concerned, of course under general direction of Prof. Shamel.

### Chilean Nitrate in Relation to Pan-American Trade

Written for California Cultivator  
By William S. Myers

HE nation that can dominate the sea can dominate the world. The present vast commercial advantage of the United States may only be temporary, since European nations, by domination of the cheapest transportation of the world, by water, may after the war resume the financial ascendancy which was theirs before 1914.

We shall certainly fall back to the position of second or third place if we do not build up an American merchant marine now in short order. It will be of little account, however, unless we have a powerful navy to protect it.

One of the most important items in the preparation of munitions of war is nitrate of soda. The scarcity of shipping at present is such that the water freight rates on nitrate from Chile to the Atlantic ports of North America have advanced from the usual \$5 per ton to upwards of \$25 or more. The situation calls for an enlightened governmental policy for promoting shipbuilding in South American countries as well as North.

#### Need of Nitrate

Quite aside from the importance of nitrate of soda in agriculture and its importance as an article of commerce in the development of Pan-American trade is the necessity of a goodly reserve supply of this material by our government for making munitions of war.

So many sensational statements have received credence of late that uninformed people might suppose that Chilean nitrate supplies would be exhausted at a very early date. Nitrate grounds already surveyed, however, still contain enormous quantities. The surveyed and certified tonnage opened up at the present time, ready for extracting, is estimated at 250,000,000 tons. The specific life of the surveyed deposits is estimated at upwards of 200 years, even allowing for a steadily increasing annual rate of consumption.

#### Pan-American Railway

An important consideration for those of us interested in Pan-Americanism is the completion of the longitudinal railway from Kansas City to

# -wide awake ranchers are now planting SUDAN HAY!

HAY CROP  
is LIGHT

Plant  
SUDAN  
SEED NOW  
and MAKE  
MONEY

CROP  
MATURES  
IN 50 TO 60  
DAYS

Sudan hay growers will "coin money" this year because of the scant general hay crop. Do you realize that all classes of hay are commanding fabulous prices? Do you want to "get in" on this high-priced market? Then plant Sudan seed at once and harvest a bountiful crop in 40 to 60 days—a rich, sweet, nutritious hay relished by *all kinds of stock*.

Do you know that Sudan is recommended by agricultural experts all over the country? It grows so fast and thick that it crowds out all weeds. It is twice as nutritious as barley, timothy or rye—and gives twice the yield per acre. Farm papers throughout the State are urging ranchers to plant Sudan hay to counteract hay shortage.

If you want to add substantially to your bank account with mighty little trouble and effort—plant Sudan now—the safe, sure, "easy-to-grow-and-handle" crop. Ask the editor of any farm journal. Read the last bulletin on Sudan grass issued by the University of California. Big free illustrated folder will be sent by return mail.

Buenos Aires, so that in time of war we would have not only nitrate deposits available for use, but safe and rapid transportation of other munitions of war, should we be called upon to help our southern neighbors; for, even with a powerful navy, which is absolutely necessary, the regular and expeditious arrival of supplies would be even more fully insured by the completion of a railway from Buenos Aires to Kansas City than could be provided in any other manner.

#### Responsibility of Free Nations

The present crisis is throwing a cold, dry light on our policies, and

broad, comprehensive views of them are strongly suggested. Never has there been a time when such views were more necessary.

The efficiency of democracy is everywhere on trial as never before, and the free nations of Europe have much more than ordinary responsibilities of war, since they must now demonstrate whether they are more efficient than the typical central monarchies of Europe.

Some practical legislative proposals are now in order to help avoid military and naval unpreparedness in future, and let us hope for them soon. Two or three are obvious enough to invite immediate consideration.

## Selling Fruit by Auction

**T**HE EDITOR of the Redlands Facts, Senator Lyman M. King, has made the rounds of some of the Eastern fruit auctions and writes interestingly of his observations:

While "back east" recently I had the privilege of spending a part of one forenoon down on the docks of the Erie railroad, where California fruits are auctioned off every day except Sunday, to the wholesale buyers of New York and the section immediately contiguous thereto. It is really one of the sights of the metropolis, and Californians who are interested in the orange business would find it of intense interest to include this in the list of things to see when they plan to visit the white lights and other diversions of "little old New York."

This one dock is, given over to the display of fruit offered for auction and everything shown on the dock in the morning is sold before the day's business closes. It is a rule of the management, and one that has been found important, that every bit of produce offered in the morning shall be sold. There is nothing left over for the next day. Anyone who puts up his fruit must take the consequences of the conditions of the day's sales. He cannot open his fruit and, seeing the market fall off, pull it out until a more favorable time.

The Erie dock is a long one. It has to be to accommodate the large offerings of California fruits. Not only citrus fruits are sold here, but also the cherries, peaches, pears, apricots, nectarines and other deciduous productions of the central and northern part of the state. The morning we attended, June 5, four cars of California cherries were on the dock. They were fine looking fruit, well packed; 2000 crates to the car, or a total of 8000 crates of cherries sold in this way in one morning. How great must be the stomach of Gotham to consume this immense offering of one kind of fruit.

Such fruits as cherries, being more perishable than the citrus fruits, come across the continent by express. Those shown the day we were in New York were in excellent condition, and the buyers snapped them up greedily. It was especially interesting to note the sale of one special pack. Some enterprising shipper, in an attempt to please the retail trade, had packed his cherries in little round containers in the regulation crate. The bidders jumped all over each other, literally as well as figuratively, in bidding for that special pack of cherries. It saved a repacking on the part of the retailer, and the wholesale buyer knew he could turn over that lot with no trouble whatever. Whether the added price to the grower was sufficient to care for the extra expense or not, I

had no means of knowing, but it looked as though a certain amount of fancy fruit of this kind so packed, would bring a very remunerative price.

The orange market, however, is the part of the auction of especial interest to us. The dock is a long one, and the oranges, lemons and grapefruit were displayed down the two sides thereof, leaving an abundance of room in the center for removal of the fruit after it is sold and for the inspection of it prior to the sale. The fruit is very attractively displayed. It is racked up, with a general effect not unlike that achieved at the National Orange show, though naturally with some less attention. But sufficient of it is shown to make a remarkably inviting display. In front of each offering are several boxes, to which buyers have free access, for the purpose of examination. They go around digging into these boxes, catalogue in hand, for every lot is catalogued, and the actual sale takes place a little later in the auction room, every buyer with his catalogue marked as he desires for his individual purposes.

The amount of decay in a lot is shown by leaving the wrap on individual oranges on the top layer of the dig-in box. If there are three wrapped oranges on the top layer, it indicates that each layer contains three decayed fruits, and by figuring the number of layers in a box, one arrives at the percentage of decay. Practically all of the fruit on display the day of our visit was navels, and in excellent condition. One could not but be very proud of Southern California, to see the magnificent lot of citrus fruits offered for sale, and realize that this was but a single day of business, in one line, in one city, though, of course, the New York auction is the largest of all.

The exchange fruit is shown on one side of the dock, beginning at the front entrance, and extending down and around the other end, if there is sufficient of it to make the turn. Independent shippers have the right hand side of the building, as one enters. The exchange fruit is the first sold. The exchange had on display the day of our visit enough to practically take one-half the dock facilities. The other shippers had approximately one-third as much. The exchange offerings included quite a few lemons and some grapefruit. No other fruits than oranges were offered by other shippers.

There was no Redlands fruit on sale the day of our inspection. Rialto, Upland, Highland, Riverside and other nearby districts were included, with some showings from Orange County, especially from Anaheim. But the excellent quality of all the fruit was very noticeable, and the attractiveness of the pack and of the display drew admiring comments.

## A Bigger Yield From the Same Field

From any field that you have been manuring by the hand method you can get a bigger yield if you use the spreader method—and save much time and labor.

A good spreader tears up the manure into small particles and spreads it evenly. The manure goes farther. It can be worked well into the seed bed so that the plant roots get all of its valuable plant food. *Wasting manure is like wasting money—a good spreader makes every particle of manure count.* A Newton County, Ind., farmer testing the spreader and hand methods of applying manure on two ten-acre tracts found that the spreader method gave 120 more bushels of corn, 140 more bushels of oats and 9 more tons of clover.

### The John Deere Spreader

The Spreader with the Beater On the Axle

has special capabilities for increasing your crop yields. Its exclusive features make it the ideal implement for the best method. Ask any owner of the John Deere Spreader about the way it increases crop yields and saves time and labor. After you have operated a John Deere Spreader of your own for a year, you will fully appreciate how much these gains really mean. You'll find that the Spreader with the Beater on the Axle more than pays for itself in one year from the gains it gets on even a fair-sized farm.

The beater on the axle construction eliminates all chains, clutches and scores of other trouble-making parts. Does away with half the types of castings otherwise necessary. Does away with adjustments. Puts upkeep at minimum. Makes the John Deere Spreader exceptionally long-lived.

Beater is all steel—practically indestructible—runs on roller bearings, aiding light

draft. Beater teeth spirally arranged—tear up manure perfectly and distribute it evenly. Deliver manure close to the ground—wind does not affect spreading.

Revolving rake feeds manure to beater evenly, aiding in uniform distribution. Shock—absorbing spring relieves spreader and horses of sudden strains.

Spreader only hip-high to top—easy to load. Big drive wheels—light draft. Ball-bearing apron drive—apron travel frictionless. Simple

gear attachment keeps weight of load from making apron race when spreading up hill.

Easy to operate—only two levers—one lever determines number of loads spread to the acre; the other starts and stops the spreading. It's so simple, a boy can operate it.

Wide-spread attachment for extra wide spreading.

Write for booklet on the John Deere Spreader.

## Thoroughly Disc Before and After Plowing

After the grain has been cut from your fields and before the hot August and September sun has cracked the ground, allowing the subsoil moisture to escape, use the

### John Deere Model B Disc Harrow

Noted for Thorough Disking

It produces a fine dirt surface mulch that stops evaporation of moisture and catches and holds rainfall. Mixes stubble, trash and weeds thoroughly into the soil. Checks weed growth. Pulverizes surface thoroughly—ground is kept mellow—plowing is made easier.

Using the Model B after plowing completes a seed bed that is thoroughly

pulverized through and through—no trash bunches—no clods—no air spaces—seed bed fits the subsoil perfectly.

The Model B is exceptionally flexible—that is why it disks so thoroughly. The spring pressure third lever assures uniform penetration regardless of dead furrows or ridges.

Write now for free booklet on this profitable disc harrow.

## Big Book Free

### Better Farm Implements and How to Use Them

America must produce more food. Labor-saving implements will play an important part in increased crop production.

This book tells all about a full line of labor-saving farming implements. Tells how to

adjust and operate many of them. A practical farm implement encyclopedia. Worth dollars. Illustrates and describes the following machines: Walking and Riding Plows, Tractor Plows, Disc Plows, Disc Harrows, Spring Tooth and Spike Tooth Harrows, Corn and Cotton Planters and Drills, Listers, Alfalfa and Beet Tools, Grain Drills and Seeders, Riding and Walking Cultivators, Lister Cultivators, Mowers, Side Rakes, Loaders, Sweep Rakes and Stackers, Hay Presses, Grain and Corn Binders, Corn Cutters, Stalk Cutters, Kaffir Headers, Manure Spreaders, Portable and Inside Cup Elevators, Corn Shellers, Wagons, Farm Trucks and Buggies. This big book will be sent FREE if you state the implements in which you are interested and ask for Package X-1110.

## John Deere Said

in reviewing his career, that he felt most pride in the consciousness that he never produced an implement of poor quality.

The same pride that John Deere felt is the pride of the makers of John Deere implements today. It is a powerful incentive to the maintenance of the high standard to which John Deere tools have been kept for eighty years.

JOHN DEERE, MOLINE, ILLINOIS

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

The auction sale itself was bewildering until one could "get the hang of it." The auctioneer, flanked by an array of clerks who seemed to have no difficulty in knowing what he said, was at a long raised counter in the part of the building that would correspond to the stage in a theater. In

front of him, packed in closely in seats just like those of a playhouse, except that the rise in elevation was greater, sufficient for the buyer to make his individuality immediately known when he jumped to his feet, shouted at the top of his leather lungs and waved his catalogue wildly in the air, were the bidders.

Most of the buyers were foreigners, Italians and Greeks I would say predominate. At least most of them were of the Latin cast of features. But they are mighty shrewd businessmen, know their business, and the competition of the auction makes them quick of action, both bodily and mentally. They are very thorough in their early inspections and they are not fooled a bit as to the quality or condition of any package offered. Of course, they buy for as low a price as they can—that is to be expected. But there is genuine competition. There were probably 150

## Claremont Pomological Club

The Last Meeting of the Season at Ganesha Park, Pomona, with All Day Discussion of Live Topics

**A**S usual a large attendance was given to the last meeting before the summer vacation of the Claremont Pomological Club at its meeting last Saturday at Ganesha Park. The meeting opened in the morning and live discussion continued until luncheon time. After an excellent luncheon under the great trees the program was taken up for a full afternoon session.

Legislation was discussed by E. R. Shepherd. Special reference was made to legislation which will be of value to the producing interests and fullest commendation given the recent legislature because of beneficial enactments.

C. P. Claussen, who has been acting for the federal department of agriculture in an effort to secure parasites of citrus scales and citrus mealy bug in Japan, returned from the Orient in time to attend this meeting and made an address, which was listened to most intently, telling of the success which attended his efforts in his search for these parasites.

One strong feature of this meeting was to have been a resolution urging that Mr. Claussen be secured to take charge of the insectary recently established at Alhambra, Los Angeles County, but instead of a resolution being necessary the announcement was made that the appointment of Mr. Claussen had already been made and that he had accepted the work and will be in charge of the Southern California insectary.

Dr. Webber of the citrus experiment station spoke of the insectary and its opportunity for great work. He also spoke of the experiment station at Riverside and the fact that it is now getting ready for greater service than ever. Incidentally, he discussed the matter of the recent hot wave and its injury in all parts of California. This brought up general discussion and reports from all sections. Many were very pessimistic. Others were more hopeful and thought that as time passed it would be found that the per cent of injury would be much less than at first estimated.

J. W. Mashmeyer, one of the Los Angeles County horticultural inspectors, reported that he had made most careful investigation of the effect of the heat on the insects and found that not only were the young scale killed but eggs showed no sign of life. Instead of recommending a discontinuance of fumigation nearly all who spoke on the subject recommended that fumigation be followed as usual, and if carefully done almost a complete extermination of the scale should be possible.

Senator Rominger discussed legislation beneficial to the fruit industry, citrus as well as deciduous. He also discussed the advantages which will accrue to the state—and especially to the drainage district of the San Gabriel River—because of the appropriation by the recent legislature of \$1,080,000, which sum is to be duplicated by the federal government. Also Los Angeles and Long Beach will supplement these funds. These appropriations will make possible the saving of thousands of acres of val-

uable land and give assurance of protection to those who are near the San Gabriel and Santa Ana Rivers.

Harry S. Smith spoke of the new insectary and referred to its opportunity for benefiting the citrus industry of the southern end of the state. In connection with this discussion it was announced that Avery S. Hoyt has been appointed by State Commissioner Hecke as field deputy for Southern California and it is hoped he may make a trip through Florida and investigate methods of work with citrus canker and bring back to California information as to best means of control in this state should this pest ever appear. R. P. Cundiff will be field deputy for Northern California.

Many attendants at the picnic referred to the fact that the Argentine ant is appearing in greater numbers than ever before. We hope we may be able later to give methods of handling this pest.

A resolution was passed urging that the department permit R. S. Woglum, who has been in California for many years investigating fumigation and insect control, to be transferred to Ontario and that he be requested to unite with state and county officials in a thorough study of the citrus mealy bug and best methods of control.

Another resolution expressed the thanks of the assembly to the state horticultural commission and to the state board of control for their activity and definite action regarding the establishment of an insectary in the South and for the appointment of

Mr. Claussen, also for the appointment of Mr. Hoyt as deputy commissioner. There is now entire harmony between the state commission, University of California and the federal department of agriculture. The commission will have charge of police and quarantine work, while investigational work will be left largely to the university.

Prof. Wm. Mertz of the Riverside station made an exceptionally fine talk on the results of rejuvenating old worn-out orchards. This work has been conducted by the Riverside station in regular commercial orchards and Mr. Mertz outlined much about other methods which have brought about the production of seven or eight boxes per tree from orchards which when taken produced nothing. As to whether such orchards should be taken in hand or uprooted and new trees planted instead, Prof. Mertz was emphatic that the bearing orchards could be brought on quicker from the old orchards than from replanting. Prof. Mertz was repeatedly interrupted and the entire assembly united in the discussion of this matter.

Toward the end of the session home canning, especially of vegetables, was taken up. Mrs. Mertz led in this discussion, and in it she was joined by Mrs. Kelly and Mrs. Webber. The ladies were asked many questions, and much information was given which will aid in more general canning.

The recently elected officers of the Claremont Pomological Club are C. H. Needham, president; E. W. Olds, vice-president; Mrs. W. L. Fretz, treasurer and V. V. Leroy, secretary.

The farm bureau at Carneros, Napa County, recently met and elected officers for the coming year.

# Vegetable Planting Calendar for July

## Southern California

Written for California Cultivator By D. F. Reichard

OUR warm ripening weather of the past month is no doubt maturing so much garden stuff that it cannot all be consumed while fresh. If you are not able to sell your surplus, either can, dry or preserve it. Do not allow it to be wasted, for every pound of fruit or vegetables grown for consumption at home is that much less taken from the stream of foodstuffs that America must keep flowing to Europe. Whatever each of us consumes must be taken from that stream unless he produces it himself.

As each plot is harvested clean it up, and if the ground is not naturally moist soak it thoroughly. Wet it so that the moisture will be down at least three feet. Work up the soil as soon as it is fit to a depth of one foot and settle well by thoroughly pulverizing. Soil in this condition, unless naturally porous, will retain the moisture for three or four weeks, so that seed sown soon after the soil has been thus worked will come up without any further irrigation. This is especially desirable at this season of the year, as a crust is so easily formed

by irrigating or particularly sprinkling during warm weather. It is advisable to plant all seeds a little deeper at this time where they will be in moist dirt, which is necessary for good germination.

After the deep working of the soil the wheel hoe does away with much of the back-breaking work of weeding and hoeing. Work that used to be hard and tiresome for a man to do can easily be done by half-grown boys or women, if they please.

Plant during July vegetables for late fall and winter use. String beans, squashes, cucumbers, melons and corn may all be planted with safety. The hardier vegetables, like beets, carrots, parsnips, salsify, peas, turnips, lettuce and radishes, should be put in if there is room in the garden. The early plantings of winter potatoes are put in during the latter part of July.

Sow the seed of cauliflower and cabbage now for plants to set out that will mature for Christmas and early winter. Tomatoes and peppers may also be started for planting out in frostless districts for winter fruiting.

## Northern California

Written by California Cultivator By A. R. Gould

OBSERVATIONS and various reports from all parts of the state lead us to believe that there has been increased planting this season of all kinds of vegetables, and land which was formerly growing weeds has been put to good use. While it is now getting rather late in the year to continue this good work on a large scale, there may be a few instances where there is a small plot close to a water supply where a few feet of hose and a sprinkler would work wonders if the land were cultivated and put into condition for planting.

There are a few subjects which could be grown to advantage. Then again, some may have poultry to feed, and grain feed is high, but if the vacant plot is brought into use kale and sea kale beet can be grown to supply the need of the poultry, which is an important consideration these days. We would like to urge our readers to give this some thought, and if there should be an opportunity, to seize it at once.

Watering, weeding and cultivating are the principal duties for this month, and harvesting some of the crops should bring joy to those who have toiled long and constantly. Successional sowings may be made for the fall of turnips, parsnips, carrots and beets for storing in the fall.

### Tomatoes

It will be necessary to cultivate around the plants, and where these are planted out in quantity on a large area and they are to be allowed to ramble on the ground, earth up around the roots and form a dry mulch. These will then grow throughout the season without much more attention.

Where the method of growing on the single stem or three main stems is adopted it will be necessary to stake the plants and pinch out all the lateral shoots. That is to say, those small shoots which appear in the axils of the main side branches, as only about four fruiting branches are allowed to remain on the plant, and the vine is

stopped or pinched at the top after these have set their fruit. This method is largely adopted in Europe, and choice early fruits are secured while the vines are not allowed to make such rank growth as they otherwise would do under natural conditions. However, in California splendid crops are obtained by allowing the plants to ramble unrestrained on the ground where they thrive in full sunshine. If signs of aphids are observed spray at once with blackleaf 40.

### Turnips

Make a sowing of Early Snowball, Purple Top, Flat Dutch and Purple Top White Globe. These will all come in for fall use and may be stored later on. Water and cultivate liberally.

### Beets

Sow Extra Early Blood Turnip and Detroit Dark Red for fall use and storage. Keep these fairly well supplied with water.

### Brussels Sprouts and Kale

Make a sowing of these for winter supply. Prepare a seed bed and secure seeds of Cooper's Selected Aigburth Brussels Sprouts. A one-quarter ounce packet will supply thousands of seedlings which should later on be transplanted. Sow thinly broadcast. Sow one-quarter ounce of Tall Green Curled Scotch Kale broadcast and eventually transplant. This is excellent for poultry feed, and when used young the leaves make a fine vegetable.

### Kohl Rabi

A sowing of this should now be made for fall use, and if well supplied with water will mature early and will be found to equal turnips in flavor. Early White Vienna and the Large Green are both good varieties to grow. Carrot

Make successional sowings this month of Early Short-Horn and Danvers Half Long. Sow in quantity as they may be stored later for winter use. Thin out the seedlings when large enough. Keep fairly well sup-

plied with water and cultivate between the rows.

### Cabbage

Seeds of winter varieties such as Savoy, Perfection, Drumhead, Autumn King and Burpee's Surehead, should now be sown on a well prepared seed bed broadcast. Sow the seed thinly.

### Parsnips

Another sowing of Hollow Crown may be made this month for a later supply and storage.

### Celery

This should ere this have been planted out in trenches and will require lots of water. Keep a close watch for slugs which will soon destroy the plants.

### Melons

Watermelons, muskmelons and casabas should have been thinned out, leaving one or two plants to a mound, and given a liberal supply of water.

### Swiss Chard

Make another sowing of this toward the end of the month. The large ribbed white is the best variety to grow for table use or poultry feed.

### Lettuce

Make successional sowings of White Paris Cos and California Cream Butter for transplanting and thinning out. Sow in rows.

### Beans

There is still time to sow beans. Early long yellow and Refugee may be sown. Keep the cultivator busy between the rows of those sown earlier.

### Corn

Make the last sowing of this before the middle of the month and sow Early White Cob, Cory or Golden Cream.

**GLENN COUNTY FARM BUREAU**  
Farm Adviser W. H. Heileman of Glenn County, Sends Schedule of Meetings and Notes on July Work

July 2 and 3, Ord. night meeting, Tuesday, July 3; 5, national farm loan at Greenwood; 5 and 6, Bayliss, night meeting Friday, July 6; 7, directors meeting at Willows 10 a. m.; 9 and 10, Codora, night meeting Tuesday, July 10; 12 and 13, Larkin, night meeting Friday, July 13; 16 and 17, Orla, night meeting Tuesday, July 17; 19 and 20, Jacinto, night meeting Friday, July 20; 23 and 24, Elk Creek, night meeting Monday July 23; 26 and 27, Plaza, night meeting Friday, July 27.

Regular monthly meeting of directors will be held at Farm Adviser's office, Saturday, July 7th at 10 a. m.

The Codora Center will assemble for a home canning lecture and demonstration early in the month. Date will be announced later.

Mr. Henry Washburn, of the staff, will remain in the county until the middle of the month to aid in starting farm record work. Farmers can get into touch with Mr. Washburn through the adviser's office.

Persons interested in grasshopper, squirrel, and gopher control work should get into touch with the farm adviser or county horticultural commissioner.

Various counties in the state having farm bureau organizations are making inquiry for barley, wheat, alfalfa, and grain hay, and grain sorghums. Farmers having any of these products should list them, giving prices.

### NURSERYMEN ARRANGING FOR CONVENTION

The California Association of Nurserymen is planning for its seventh annual convention, which will be held in

San Jose October 11-13, when there will be discussions on horticultural progress of California and questions of interest to the nursery trade. Santa Clara Valley people promise a live interest in this convention of nursery people, and as that section is one of the earliest fruit growing sections of California and is today one of its most important it should call for a big attendance.

## Ornamental Planting Calendar for Northern California

Written for California Cultivator By A. R. Gould

IN THIS department we must keep busy with the sprinkler and hoe. It is getting late to plant very much, although there are a few subjects we can sow for future use and we have to think of our early spring display.

### Annuals

Most of these have no doubt been established and will be providing us with flowers. Tall growing subjects such as cosmos and sunflowers will require supports, and stakes should be provided. A sowing of Shirley poppy and mignonette, Golden Machel may be made.

### Chrysanthemums

These will require stakes and should be cultivated frequently. A mulching with manure will prove beneficial.

### Roses

If these are cut back now a second growth will be encouraged and another supply of blooms will be the result. Keep a close watch out now for mildew and dust with dry sulphur or spray with lime and sulphur solution.

### Spring Subjects

It is now time to look ahead and

plan for the spring display. The following should be sown to supply the need in early spring: Wallflowers, Double Daisy, Giant Ranunculus flowered Forget-Me-Not and Alpestris are all good varieties.

Arabis alpina, a beautiful white flowered trailing plant will provide a carpet of bloom. Useful for rockeries.

Violas, or tufted pansies may be secured in white, mauve, yellow, blue and purple and will flower for many months in shade or sunshine. They are fast becoming very popular and may be used to carpet bulb beds or for borders. Sow the seed of all the above subjects in boxes of well prepared soil or on a seed bed. Keep well watered and shade from the sun. Watch for slugs constantly when the seedlings are about to appear.

### Dahlias

These will now require strong stakes for support, and if large flowers are required disbudding should be practised, which means that where three buds show on a shoot the two side ones should be removed, leaving the central to develop.

## Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Cheese From Sheep's Milk

An Eastern inquirer wishes information as to possibility of securing a supply of milk from sheep for the manufacture of a certain type of cheese most popular in Europe and used to a large extent in this country. An effort along this line was made in Solano County. Mr. J. H. Glide at one time gave a fair trial to this product. We wrote Mr. Glide and have from him the following: "I do not know of any place in this country where you could secure the ewes and the feed so as to make a success of producing the milk of sheep for the manufacture of cheese. I discontinued it for the reason that the Greeks employed were very unreliable and would only use the ewes for a short time."

### Bean Straw.

A subscriber wished information as to the price and tonnage per acre of bean straw, especially as to Tepary. The matter was referred to A. A. Brock, horticultural commissioner of Ventura County, and he answers:

"Relative to price of baled bean straw and tonnage produced on an acre by various beans, we have no data on the Tepary other than that obtainable through articles written in our agricultural papers. Baled lima bean straw can be bought early in the fall at from six to ten dollars a ton, depending on the season. If we have early rains the straw is so damaged that little of it is suitable for stock feed; therefore prices are generally high. If the bean straw is baled before it has been rained on the supply is sufficient to meet local demands and prices are somewhat less. If the straw is rained on before it is baled it can be used as fertilizer. I believe that straw of this kind sold last year at from three to five dollars a ton, loose. The demand for lima bean

straw for citrus orchards is rapidly increasing, therefore prices may rise accordingly. You, of course, have the analysis of bean straw and well know the value of this material as a fertilizer. The amount of lima bean straw produced on an acre agrees with the pounds of beans produced, and in this county is about a ton to the acre. I have no data on the tonnage of black-eye straw per acre, but, judging from the amount of vine, I imagine it is somewhat heavier in proportion to the amount of beans than with the lima. Small whites I have no data on, but believe that the pounds of beans produced would exceed the amount of straw. We have been growing small whites on a commercial scale for only a few years. There are a number of other varieties grown in this county for seed, but I have no data on the amount of straw produced."

Director R. H. Forbes of the Arizona experiment station also writes: "Baled bean straw has not been made use of as a commercial article thus far in Arizona. With reference to the tonnage of bean straw from Tepary beans, I will say that we have obtained as much as three tons of Tepary bean hay per acre, from which fact, I should judge, allowing for row planting and beans taken from the crop, that the yield of bean straw ought to be between one and two tons to the acre."

### Artichokes

I have California artichokes three years old. The stalks are thrifty but this year the fruit is small. Kindly advise me how and when to handle.—Subscriber.

We presume you refer to the Green Globe artichoke and would say these require a strong heavy soil, adobe being preferable, but good results can be obtained on lighter soils by heavy fertilization with barnyard manures. In the early fall we recommend cutting the tops back and abstaining from irrigation.—D. F. R.

### Potato Tops

What causes tops of potatoes to grow high and rank?—Subscriber, Los Angeles.

One reason for this is that a faulty system of irrigation may have prevailed. The tops of potatoes should never be sprinkled. Irrigate deeply, then cultivate frequently and allow surface soil to warm up and not become crusted or bake over, which it surely does when sprinkling is indulged in. When the vines are large enough to cover all the ground cultivation may cease.

### Pest of Birds on Figs

I have a White Adriatic fig orchard and suffer considerably from the depredations of birds which consume a large part of the crop. Principal offenders are magpies, crows, linnets and sparrows. Can you tell me of some means to minimize the danger?—Subscriber, Oroville.

We know of no practical remedy. Scarecrows help a little. Fluttering pieces of tin or cards tied to the branches of trees may be used. We read recently of a device fitted up by a farmer in Shasta County whereby a system of cow bells was attached to a water wheel, and the constant ringing of the bells effectually frightened away the birds. The use of a shot gun to frighten them away is sometimes practiced. Where it is desired to protect only a tree or two mosquito netting may be spread over the tree. The use of strychnine on freshly cut fruit or other bait distributed about the orchard is practiced by some, but, of course, there is the possibility of killing off many beneficial song birds. If subscribers of the Cultivator have helpful suggestions we will be glad to pass them on.

### Cactus for Rabbits

Would appreciate information through the Cultivator as to any experiments in feeding spineless cactus to rabbits.—Subscriber, Milton.

The advisability of any kind of green feed for rabbits seems to be a mooted question. Some go so far as to claim that no green feed should ever be given. By far the greater number, however, do feed some succulents. We note in "The Belgian Hare Guide": "There is little doubt that bad effects result from a too liberal supply of green feed, and the same may be said when the amount is too restricted. But the large majority of the rabbit breeders find that green stuff is essential to the health and well-being of their animals." Also, we note: "Lettuce is particularly useful for breeding does, although of so watery a nature that it should not be given in large quantities nor in wet seasons." The same warning is given as to cabbage and other plants which are too watery and cold. Also, Townsend's "Practical Rabbit Keeping" says: "Both cabbage leaves and lettuce are too watery and should not be used." This author, however, recommends many weeds and other green feeds and gives warning as to excessive feeding of carrots or other roots, which are, however, highly recommended if fed with caution. As to cactus, we find no notation from any who have tried it. We will pass the question on to our rabbit fanciers.

### Cold Storage

Please give information in regard to cold storage, what it would cost to start a plant for say 10 to 20 tons of potatoes?—Subscriber, Bishop.

We hardly think cold storage would be practicable for so small a quantity. There are two systems of securing cold storage, one is by the use of ice, usually natural ice, and where a farm

is in a section of cold winters it is often produced on the farm. The other system is by the so-called ammonia or chemical process. Such a plant certainly would not be within economic limits for a small place. The usual method is for the farmer to ship his crop to a market center, where it can be placed in cold storage for about \$2.50 per ton per month. Unless material advance is made in potato prices it is a product which would hardly justify cold storage. With a double walled store house, and plenty of ventilation, using care in opening the house during the night and closing during the daytime, potatoes should be kept reasonably well, although it must be borne in mind that the spring or summer crop of potatoes in California is not as good a keeper as the fall-grown crop. If any reader of the Cultivator has had experience with a summer storage plant we will appreciate information along this line.

### Wire Worms on Beans

An inquirer in the Lima bean section wants to know best method of handling the pest of wire worms, which sometimes destroys the seed before it germinates and is also a serious pest of growing plants. This is a long question or one calling for a long answer, and the best suggestion is for every bean grower to secure a copy of the monthly bulletin by the state commission of horticulture. The issue of June, 1916, Vol. V, No. 6, on page 225 begins an extended article written by J. N. French, county horticultural inspector located at Oxnard, Ventura County. It discusses in several pages, with illustrations, this matter of wire worms. In a word we may sum up the article in the following conclusion: In working against the worms the potato catch crop method is recommended because it is cheap and can be worked on a large scale.

### Sick Hens

Could you please give me information as to what disease is among my hens? They get lame, tails droop, then after a few days, cannot stand, and necks stretch out or fall under their bodies. They live for several days in this condition. They have large yard, with barley for feed. — Subscriber, Lompoc.

Something is poisoning your hens. It may be mold spores from moldy food or scratching litter which have fastened themselves on the mucous membranes of throat, nasal passages or even intestines. It may be spoiled or decaying meat, and it may be their constant diet of barley, the hulls of which sometimes clog the digestive organs. Your first step must be to

find out which of these causes has been at work, and remove it. Meantime, a good dose of physic may relieve some of the sick hens. Give Epsom salts, a tablespoon for each hen, mixed in a small amount of wet mash, if the hen will eat. If you cannot induce them to eat, castor oil is better. Give two or three tablespoons to each affected bird. I gather from your letter that you are feeding nothing but barley. If this is the case you may expect all sorts of digestive trouble, for no hen can continue healthy without a variety, and the barley hulls make this a particularly trying diet. Better keep a good laying mash before the hens at least half the time, sprout or steam the barley before feeding, and make part of your scratch feed milo, kafir or Indian corn. Plenty of green feed is an immense help in preventing indigestion.—J. A. K.

### Rabbits out of Condition

Please advise what is the trouble with rabbits which eat heartily and seem to be hungry but remain very poor for months and finally die. They are fed green stuff and alfalfa hay and have access to plenty of fresh water.—Subscriber, Susanville.

This query was referred to C. P. Gilmore, who answers:

"This may be lack of vitality or spotted liver. The former is caused in many different ways, eg. too many young to the litter, breeding does too often or too young — should not be bred under seven months, allowing stud buck too many services—not over two a week should be allowed, improper feeding, inbreeding regardless of kinship, breeding animals unfit. Spotted liver is generally caused by the excess feeding of heavy greens such as cabbage, kale or green alfalfa. This and weak vitality go hand in hand. Would advise that you purchase some good book on the subject; it will be money well spent.

### Broom Corn Thresher

How can I make a suitable broom corn thresher or seeder; also a baler?—Subscriber, Calexico.

Illustrations of threshers and balers

are given in Farmers' Bulletin 174. This was printed in 1903 and if not out of print may be had by writing Department of Agriculture, Washington, D. C. Whether it is practicable to make these threshers for 15 or 20 acres of broom corn we would question. The Oklahoma college of agriculture also issues a bulletin on broom corn. Ask for Vol. 8, Bulletin 32; also Bulletin 68, "Dwarf Broom Corn." A more complete treatise on the subject is "Broom Corn Culture," by A. G. McCall, published by the Orange-Judd Company. The Cultivator will secure this book for subscribers at publisher's price.

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

### Willing All to Children

If a mother wills her deeded property to her children, can her husband come in for claims upon it? If so, how can said property be fixed that the children may inherit the entire property?—Subscriber.

If the property is the separate property of the mother she has entire power to will it to whomsoever she may desire, and the devisee will acquire good title. The nature of the claim of the husband is not stated and no advice upon that subject could be given.

### WORM REMEDY FOR HOGS

A hog conditioner and worm preventive may be made as follows: Slake one bushel of burned lime and eight pounds of copperas together. When cold add eight pounds of sulphur and mix with four pounds of salt and enough wood ashes to make three bushels of the mixture. Put in a box or on the feeding floor and keep available for the pigs.

### MOST LIKELY TRUE

Trombone of Village Band—What do we play next, Si?  
Si—Sousa's Grand March.  
Trombone—Gosh all hemlock! I jest played that!—Judge.

## Marketing Cantaloupes Under the Standardization Act

By F. W. Waite, Horticultural Commissioner Imperial County, Before Horticultural Commissioners' Convention at Modesto

THE act creating standardization of fresh fruits in this state, August 8, 1915, was put into effect on the cantaloupe crop of the Imperial Valley in the year 1916, being the first year after it became a law. As this season's crop is just beginning to move, I will give an outline of how we handled the inspection last year.

### Cooperation

It has been proven that where the law was enforced last year much good was done. Realizing that laws are of no effect unless enforced, I decided to use the authority vested in me and do my duty to the best of my ability. This being the first time a law was to be enforced on the packing and shipping of cantaloupes, there were many things to be considered, and in order to get all parties interested in and acquainted with the law, I decided to call a meeting of the shippers and distributors and give them an opportunity to state their side of the case. I wrote letters to all the distributors of cantaloupes, outlining my views, with the idea of getting all parties to meet in conference and agree to cooperate. The replies to this letter were very encouraging, and with the exception of one all were willing to cooperate. They expressed a desire to have a meeting to go over the requirements of the law and agree on plans of procedure. At the first meeting called by this department nearly all the distributors were represented. Each section of the law pertaining to cantaloupes was gone over carefully and free discussion was allowed until the subject was understood and an agreement reached.

### When to Pick

There were several reasons why it seemed necessary to have the shippers agree on the method of inspection. One of the main reasons is knowing a mature melon. The act reads it shall be mature. Old experienced melon men sometimes do not agree on a melon being mature and are often mistaken upon the examination of it, therefore it is a difficult subject and most important to the industry. In order to handle the "mature" subject it was agreed to pick all melons on the full slip; that is, when the stem parts from the melon freely with a slight pressure of the thumb, leaving a smooth cavity. This plan was used by most of the shippers throughout the entire season. It is true that in many cases reports came back from the East, "Melons overripe," yet the prices held good.

The most important fact about shipping melons too ripe is that by so doing one cannot deceive the public, and the loser is the grower, but a green melon is the one that does the damage, as it gets into the hands of the consumer and is very disappointing, thereby reducing the demand and causing a poor market. The main cause of picking green melons when not full slip is the fact that the stem is broken off and the ripeness depends upon the looks. The pickers are apt to get away from maturity and melons are

brought into the packing sheds too green. Picking and packing is done mostly by contract, and naturally no one wants to lose, consequently many melons are likely to be packed green. If there are plenty of pickers to keep up with the packers it is possible to continue on the full slip, but it is difficult to get pickers enough during the height of the season.

### Disposal of Rejected Melons

One of the next most important reasons for agreeing or cooperating is what to do with the melons that have been condemned on account of not being fit for shipment. The law says they shall not be shipped, but what shall be done with them? In the past there was trouble over the rejected melons which had been turned down by the inspector for the distributors. The growers would sell them to brokers on the street, who would ship them, causing damage to the market.

We agreed to hold them for 24 hours and then release to the grower. This plan was not successful, as the crates would be carried away in the night and some even attempted to ship by express—parties not connected with the industry. It was impossible to retain the rejected melons on the platform on account of lack of room. The plan finally agreed upon was to turn over all condemned melons to a transfer man, who fed them to hogs. It was agreed that the head inspector of each shipping company be appointed horticultural inspector and given authority to act under the state law. All the cost of inspection in 1916 was paid by the distributors and growers. The law was put into operation on May 7 by condemning and destroying seven crates of green melons. Orders were given the shippers that express shipments must be on the platform in time to be inspected before the arrival of the train or the same would be held over.

It was necessary to condemn many crates of melons in the beginning of the season until some of the growers had learned the requirements. There were nearly 9,000 crates condemned by the railroad platform inspectors, to say nothing of the number thrown out by the field inspector at the packing sheds.

### Enlarge Scope of Law

The law of 1916 has proven of great benefit, and I am glad that the amendment of 1917 has enlarged its scope and given inspectors more authority and allows closer inspection. I am in favor of enlarging it still more and taking in all the products of the farm offered for sale anywhere in the state or shipped out of the state. I am thankful for the improvement this year, but will be glad to have the facts more plainly stated as to the requirements and disposition of condemned products, also more complete definition of the word maturity in the shipment of cantaloupes, at the same time, allowing all products to be sold or shipped that are mature and fit for sale. I suggested to Mr. Ashley to add at the head of the bill, after "fresh fruits and all farm products herein

Many Citrus growers are materially cutting crop production costs by summer spraying with that combined insecticide and fungicide TRIUMPH and BORDEAUX combination, which when properly applied successfully controls fungus diseases and insect pests.

If directions are followed TRIUMPH and BORDEAUX will not spot the fruit and will stimulate the tree.

There is an ample supply of TRIUMPH and BORDEAUX available for immediate use at a fixed price.

Kill the young larvae now before they mature and do irreparable damage to your grove.

Send for prices and our book "Spraying Citrus Trees." Write Box O.

mentioned," other products from time to time. I am pleased to note that tomatoes have been added. The great per cent of producers and shippers know that it pays to put up a good pack of uniformity and maturity, but the other per cent "butt in" and make it necessary to compel them to do likewise in order to keep a profitable market. For the growers or producers it is a matter of education which sometimes has to be paid for by dear experiences. In other words, the packers have to have a direct loss by having a product condemned and destroyed before they learn this lesson well.

Before the season opened this year I called a meeting of the distributors and went over the laws as amended, all present agreeing to pick on a full

slip and abide by the decision of this department. It is very gratifying to note that this year's laws state that melons shall be fully netted and of uniform size, firm and mature, free from bruises and practically free from aphids, honey dew or other defects. Even with the increased acreage, with closer inspection and shipping only first-class melons, the market will not be destroyed. Keeping all imperfect melons from being shipped makes the market demands stronger, besides saving the cost of shipping inferior stuff, which ruins the market and causes a loss to the industry.

I make the prediction that ere long all products offered for sale or shipped will come under standardization.

## Cereal Dust Explosions

Conclusions drawn from investigations conducted at the Pennsylvania State College, in cooperation with the Bureau of Chemistry of the United States Department of Agriculture and the Bureau of Mines of the United States Department of the Interior, are as follows:

"Hard substances, such as pieces of iron, nails and stones, while producing sparks in passing between the grinding disks of attrition mills or other forms of disk mills along with material being ground, produce no explosions, as the spark does not seem to possess sufficient intensity of heat or surface to cause ignition, and is almost instantly out as soon as emitted.

"Matches are not more dangerous than the metal or stone substances in the case of disk mills or millstones, because they are fired almost instantly when coming in contact with the plates at the eye and smothered out before issuing from the mill. None of the matches are ignited when issuing from the mill. With rolls it is possible for the match to become ignited while passing between the rolls and cause a fire or possible explosion, the match stick lodging and burning, furnishing sufficient flame and heat surface.

"The spark or arc produced by static electricity does not seem to possess sufficient heat to ignite or cause an explosion of material or cereal dust as ordinarily produced in

flour or cereal mills. Only an electric arc, a naked flame, as a torch or lamp or burning match, apparently gives sufficient surface contact and heat to cause ignition of dust and cause an explosion which may produce merely a flash or an explosion more or less violent.

"An initial explosion may propagate and cause a flame to travel quite a long distance through conveyors and spouts. A conveyor does not seem to offer any obstruction to the flash or flame traveling through it or along its length. A damper in the spout below the mill is quite effective in preventing the flame from passing into the spout or conveyor below, so far as it relates to the ordinary light explosion, but it is possible for the flame in some instances to pass by the damper with a heavier explosion, though the force of the explosion or flash is checked or confined to the immediate vicinity of the damper. Another damper following the first would undoubtedly prevent any flame from reaching the spout or conveyor.

"When a secondary explosion follows it is generally more violent or possesses more force than the first explosion and is of wider extent.

"Dust in motion, as agitated by the blowing fan or caused by the jarring down or the sudden fall or cave-in of flour or feed sticking around the side of bins, is more liable to cause an explosion when a naked light comes in contact with it than the dust quietly floating in a room or bin."

## Oiling the Harness

The harness should be oiled once or twice every year. It makes them look better, makes them soft and pliable, and they will wear better. Take the harness all apart and properly mend all broken and weak places. A box of No. 7 rivets comes handy, copper being preferred to iron, as they do not rot the leather. Then take a tub of soft water heated milk-warm, and put in it a cup of soft soap.

As the harness is taken apart and mended, the pieces are thrown into the tub and as soon as the dirt rubs off easily every part is scrubbed with a small, stiff brush and hung on a pole to drain and dry. By the time the last parts are washed the first ones are ready to be oiled.

If in warm weather a good sunny day should be selected, and if in cold weather a warm room. After washing, the leather ought to be oiled before drying, as the oil strikes in much better. Take one strap at a time and give it a good going over and wipe thoroughly. As the parts dry in the

course of an hour or so another coat is given in the same manner.

Let the harness lie over night in a warm place and then go over it again, working each strap through the hands, which makes it more pliable. Two days are required to allow the oil to dry properly, after which the harness should be gone over with a cloth to remove the surplus oil. A paint brush is a good thing with which to apply the oil. There are several good harness oils on the market, but if they cannot be secured, use No. 1 machine oil, adding about a tablespoon of lamp-black to each gallon.

The farmer who has a workshop even though it be only an old building, wherein is an improvised bench and vise, a forge and anvil and some small tools has an advantage, the worth of which can not easily be estimated. The equipment for the shop consists of tools the farmer needs. They are hammers, saws, files, planes, chisels, bits, drills, pliers, pincers, wrenches, bolts, nails, staples, straps, etc.

# Wetproof Steel Lined Shot Shells

## The test that really proves something

A sportsman on the Pacific Coast, in a spirit of "show

me," put a half dozen of the new Remington UMC Wetproof Shells into a bag and placed them, bag and all, in a pail of water for a three hours' soaking.

Then he rubbed and tumbled the bag and shells together—just the way wet shells would be rubbed around in the pocket of a hunting coat.

The shells were then dumped out onto an oil-cloth-covered table—unaffected by the soaking and rubbing, except for a slight fading of color.

Next he cut one of the shells through with a knife—and found both powder and shot perfectly dry.

Stiff pressure with the thumb showed that the crimp was still firm.

Comparison with a dry shell proved that the body had not swollen.

Then he worked the remaining five soaked shells through the magazine of a Pump Gun, and found them as quick and sure fire as

though they had never been near the water.

This is the severest test of wetproofing a shell has ever been through—and one that only these Remington UMC Wetproof Shells would stand.

They make your shooting independent of climate. They are the shells you want.

### OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

### THIS WEEK'S COVER

"California in Action" makes a most patriotic scene on the cover of this issue. This picture was taken with the Cultivator camera only a few days ago near Bassett in the eastern part of Los Angeles County.

We have seen no more thorough preparation of seed bed than is being made by the big tractor with the disks and harrow, all at one operation. The ground had been thoroughly stirred and is being fitted at one motion for the coming bean crop. Meantime the walnut trees are doing their share in growing thriftily in preparation for the great crop later.

California good roads are in evidence on the margin of the picture, over which a four horse load of hay is going to market.

California is no slacker.

### "SAMMIES"

Europe has referred to the English soldiers as "Tommies," and now come Uncle Sam's boys to take their place in the trenches, and naturally they become "Sammies." We promise that every one of these "Sammies" will prove true to the traditions of their Grand Old Uncle.

### EXEMPT THE FARMER

The National Farmers Congress, the National Grange, the National Dairy Union, the American Society of Equity, the National Organization Society, the Rural Credit League, and other organizations of farmers have united in a letter to the president calling attention to the lack of farm laborers and the needs of the harvest, ending in an appeal to exempt agricultural laborers.

All America has united in preaching to the farmer. He has been urged to plant early and plant late, and usual-

ly by the class whom he regards as sitting on the fence while he does the work. It has been fine and poetical to picture the farmer with his hoe beside the man with the gun as being equally patriotic, but now if he is to carry the hoe and the gun both he is to attempt the impossible.

We believe this appeal of the organizations of farmers is not only just but most patriotic.

### THE LIBERTY LOAN

Full report as to amount of subscriptions to the liberty loan is not yet made. Up to the end of June \$3,035,226,850 had been reported, and this was more than 50 per cent more than the total bond issue.

The best part of this oversubscription is that practically half of it was made by small subscribers. There were three subscriptions of \$25,000.000 or more, but the great mass of them were for \$10,000 or under. In fact, of the 4,000,000 people subscribing for these bonds 3,960,000, or 99 per cent, subscribed amounts ranging from \$50 to \$10,000.

The Official Bulletin of the government announces that no allotments

will be made beyond the \$2,000,000.000, but that all who have subscribed for sums under \$10,000 will receive their full allotment.

The federal reserve bank making the largest returns during this campaign was the one located at New York City. This reported \$1,186,788.400. The one located at San Francisco, which covers the Rocky Mountain section and the West, subscribed \$175,625,000.

### MORE EFFICIENCY

The state is to be greatly benefited by certain changes in the office of the state horticultural commission. Heretofore there has been one deputy commissioner and field investigator, and the field 700 miles in length made it something of a job to fill the position. Now there are to be three deputies, one in the northern end of the state—R. P. Cundiff has been appointed—and one for the southern end of the state—for this work it is announced Avery S. Hoyt, for several years in charge of the state quarantine work south of the Tehachapi, has been appointed. Geo. P. Weldon will continue as chief deputy.

One of the first duties which Mr. Hoyt will take up will be investigations as to citrus canker conditions and methods of handling this dread disease in Florida. So far as known citrus canker has not made entrance into California or west of the Rockies, but preparedness is the order of the day in the state quarantine work, and one of Mr. Hoyt's first problems will be one of the greatest requiring the attention of his office.

Mr. Hoyt's appointment to field work takes him from quarantine work in the Los Angeles office of which work he has had charge for many years. As deputy quarantine officer he will be succeeded by Lee A. Strong who has been quarantine inspector at Los Angeles harbor for the past three years. Prior to this service Mr. Strong served two years as deputy under Mr. Maskew at San Francisco and two years as Los Angeles County horticultural inspector.

Another appointment which has given greatest satisfaction to the citrus producers of the southern end of the state is that of C. P. Claussen, formerly with the federal department of agriculture, now appointed by Commissioner Hecke to direct the affairs of the new state insectary.

Commissioner Hecke is a Northern

California man, and some of the citrus growers felt that at the time of his appointment he might not have fullest appreciation of the problems confronting the citrus growers, but the feeling now is general that he is big enough to see from Shasta to San Diego. We believe the changes made are most wise.

### DEDICATED

The Oregon Farmer suggests that July 4 be dedicated to America's 10,000,000 who so loyally registered, offering their services to extend America's liberty to all the world. A good suggestion, they are worthy of the day, but why not dedicate the day to America's 100,000,000, for we think there never was a more patriotic response to any movement than has just been made by all America. We say "all America," for while the papers have been more or less filled with reports of slackers and of "peace-at-any-price" movements which are disloyal, it must be borne in mind that, like reports of crimes, these are made prominent in the news of the day, while the great mass of the people are quietly standing true.

The greatly increased farming operations, the liberty loan subscriptions, the 10,000,000 registrations, all go to show that the United States is not a nation of slackers.

By the way, as to the Fourth of July, we note news items referring to preparations for observing this day in almost every nation of the world. America's pledge to help extend liberty to all the world has been taken at its true face value, and the world proposes to unite in celebrating July Fourth as Liberty Day.

### Agricultural Notes

The island of Formosa has this year the largest sugar crop in her history.

There is a campaign in Italy to increase production of jams and marmalades.

It is estimated that The Netherlands will produce this year 270,000 tons of beet sugar.

The United States is the largest importer of cinchona bark (from which quinine is made).

Paraguay and Uruguay have recently placed embargoes on all shipments of flour and wheat.

Maximum prices for cattle requisitioned for army use have been fixed by the Italian government.

The college of agriculture of the University of Illinois has under cultivation 44 pieces of land in different sections of the state.

Citrus fruit growers of Transvaal, South Africa, are considering establishing a factory to make citric acid; also marmalade factories are being encouraged.

Yellowstone Park has been motorized. The old stage coaches have been replaced by seven and ten passenger cars and most of the restrictions on automobile travel removed.

Trade in old newspapers is well established with Hongkong and large orders are now being placed from Java and other points in the East Indies. The bale of 250 pounds is the preferred size.

A recently issued royal decree prohibits the use in Sweden of electricity and gas for signs or for advertisements out of doors. This because of shortage of coal imports due to the war.

Mt. McKinley in Alaska is 20,300 feet above sea level. Twenty-two hundred square miles of its range have been made into a national park. Perpetual snow clothes the upper 14,000 feet of the peak.

During the three months ending March 31, 1917, there were 83,652,907 pounds of bleached cotton fiber, including linters and hull fiber, consumed in the United States in the manufacture of guncotton and explosives of all kinds.

The wife of a private soldier in Canada with three children between the ages of 10 and 15 may receive either \$15 or \$20 from the assigned pay of her husband, \$20 separation allowance, and \$25 from the Canadian Patriotic Fund, or in all \$60 or \$65 a month.

The annual official postal guide will be on sale in July at 40 cents. This is cloth bound and contains three complete lists of post offices, one arranged alphabetically, one by states, and one by states and counties; with a large quantity of general information.

All motor traffic not necessary for national defense will be forbidden in France if the recommendation of the official gasoline saving committee is carried into effect. This committee has been appointed by the government to deal with the whole question of gasoline, kerosene and oil supplies throughout France.

In response to an inquiry from the National Wool Growers' Association, the Forest Service has announced that stock growers having National Forest grazing preferences will be permitted, if they enlist in the army or navy, to retain their preferences without use of the range during the period of enlistment.

# Agricultural News Notes of the Pacific Coast

## Northern California

The Santa Rosa cannery is running full capacity on cherries.

The irrigation bonds of the Anderson-Cottonwood district will be sold July 6.

The planting of grain sorghums has been great in all sections of Sacramento Valley.

Growers of 10,000 carloads of table grapes in the Hanford district are taking steps to form a cooperative association.

Four hundred acres of barley were destroyed by fire at Woodland last week, as were also many tons of hay in stacks.

A big basket picnic is planned for the Fourth of July for all of Butte County at the site of the Paradise Irrigation District dam.

The California Almond Growers' Exchange is enlarging its plant at Sacramento. An additional 70x130-foot space is being built.

The Central California Poultry Producers already has a capital of \$45,000 and the management is appealing to all poultrymen to affiliate.

The request of Dixon, Solano County, for a \$2,000 appropriation by the county for a county fair has been turned down by the supervisors.

Governor Stephens has signed a bill for the taking over by the state of the highway from Boulder Creek into California Redwood Park, in the Big Basin.

Glenn County rice growers have protested to the railroad commission against the proposed raise of water rates by the West Side Canal Company.

Grasshoppers have caused serious injury to many orchards in Butte County. In one place 15 acres of young orchard were completely destroyed.

Butte County reported estimates of the coming olive crop at 75 per cent of normal; this estimate was made, however, prior to the heat wave which covered the state.

Market Commissioner Weinstock is investigating as to the onion situation and endeavoring to secure fair return to growers who have been unable to sell at living prices.

Butte County rice growers propose to erect factories or packing houses for the processing or packing of rice in cartons or packages so as to popularize California products.

An agricultural survey of Alameda County has been made under direction of the farm bureau. The county was districted so that each auto joining in the canvass had only 25 farmers to visit.

The bill introduced into the legislature by Assemblyman Pettis of Mendocino to close the quail season in that district for two years was not signed by Governor Stephens. The quail season will open November 14.

State Horticultural Commissioner Hecke reports that about the middle of June fruit conditions had made a gain over the general condition of the month preceding. Apricots are evidently far ahead of last year's crop.

The California Olive Association, composed of some of the largest packing companies in the state, has established standard sizes and grades for the coming pack. The largest size is 45 to 55 per pound; these are graded as "Giants." The smallest of the seven different grades is "Standards," 120 to 135 per pound.

## Central California

Kings County reports apricot packing in full swing.

There is a movement to organize dairy producers of Fresno County.

The cheese factory at Salida, Stanislaus County, is running day and night.

Canners of Central California expect to begin on Tuscan Clings about the middle of July.

Tulare County high school boys are responding to the appeal for help in harvesting crops.

The Stockton Weekly Mail reports "local cherry growers robbed of \$13,000 by short weight."

Dinuba fruit growers have formed a valley fruit growers association with 7000 acres already signed up.

Combined harvesters and threshers are busy and many places are producing surprisingly large crops.

It has been estimated that California's output of canned products this season will aggregate \$200,000,000.

One Fresno boy has made a raid on jackrabbits during the past year and claims the record with 18,000 rabbits destroyed.

Lodi, center of the Tokay grape industry, reports some exceptionally satisfactory sales of the coming table grape crop.

The Pacific Pea Packing Company of Oakdale, Stanislaus County, has finished its run with a total of 1,500,000 cans of peas.

Cattlemen of the Porterville district estimate the cattle shipments from that section alone will total \$500,000 in value.

State Attorney General Webb holds that the school law will not stop pupils of the public schools from doing work on California ranches.

Central California organized peach growers have netted more than six cents per pound for more than 4,000,000 pounds of peaches.

With all the cry of food shortage some San Joaquin Valley growers are allowing onions to rot in the ground because of lack of market.

Grain growers are preparing to make an inroad on the squirrels of California in compliance with the new squirrel law which will go in effect July 26.

The Madera County council of defense is urging steps for the protection of warehouses and harvested crops from fire. The state forester is aiding in the campaign.

A series of rabbit drives is being planned in the Poplar district of Tulare County in order to save the bean crop which is suffering serious injury from the inroads of the pest.

The Dinuba Grape Growers' Association has completed work on the enlarged packing house and installed modern equipment, putting the plant in first class shape for the season's run.

Appraisers of the federal farm loan bank are verifying values in Tulare County. The Oakdale irrigation district will extend its ditches to 1000 acres of new lands which will be planted to beans.

Porterville reports that the bean crop produced in that section will be damaged to the extent of a half million dollars unless the jackrabbit pest is controlled. Rabbit drives are the order of the day.

## Southern California

Palo Verde cotton has sold as high as 24½ cents.

Imperial Valley is now second in dairy importance in California.

Imperial Valley cotton crop for 1916 has practically all been shipped.

Riverside County farm bureau is demonstrating vegetable canning.

Valencias are now being shipped from all Valencia orange sections.

Deciduous fruit canning season started in Pomona, Thursday, June 28.

After July 27 every real estate agent in the state will be compelled to furnish bonds.

In one day of last week 263 cars of melons were shipped from the Imperial Valley.

Fruit and vegetable producers are planning to meet the demands of the new net weight law.

The cantaloupe packing season at Brawley has attracted nearly 1000 extra Japanese laborers.

A combination of hot weather and spray for codling moth injured apples in the Beaumont section.

Grover Loftus has succeeded Walter E. Packard as president of the Imperial County farm bureau.

A scheme to drain a thousand acres of land along the Santa Ana River is being discussed at Riverside.

The Southern California Automobile Club is issuing a series of road bulletins of value to auto drivers.

Cool, foggy days following the recent hot spell saved many of the bean fields of the southern part of the state.

The first carload of cantaloupes sent from Imperial Valley to New York brought from \$6.00 to \$15 a crate.

Riverside fruit growers, unable to find local market, are joining San Bernardino in an effort to dispose of surplus crop.

Imperial Valley is discussing the coming cotton crop and harvest of other crops and devising means of securing labor.

The Orange County apricot crop will be good, but because of fewer orchards than formerly the total output will not be so heavy.

It is estimated that Imperial Valley needs 4500 men to help in cotton picking from the middle of September to the middle of February.

Imperial County prisoners have been used to put roads in good condition in districts where hundreds of loads of melons are to be delivered.

Imperial Valley's early vegetables brought many thousands of dollars, and the industry, especially the planting of lettuce, will be greatly increased another year.

Reports of experts who have examined trees infested with black, citricola and yellow scale, report a very large percentage of them killed by the heat of last week.

Owing to one of the principal dry yards in Pomona not operating this season, the chamber of commerce is contemplating operating it in order to save several hundred tons of low-grade cots.

The food conservation institute at Riverside, under direction of Miss Clarke of the state university, discussed from all angles preparation of food in such a way as to secure greatest return for least money.

## The Coast

Potatoes at Seattle are selling at \$25 per ton.

A favorite pure bred in Idaho is the Rambouillet.

Colorado bought \$17,000,000 worth of Liberty Loan bonds.

One horse breeder at Meridian, Idaho, recently sold 15 fillies for \$5000.

Seattle, Washington, reports exceptionally light supply of strawberries.

The Southeastern Idaho Fair Association has abandoned its fair at Blackfoot this season.

The Northwest district farm loan bank at Spokane reports over \$2,000,000 in loans approved.

A mammoth dam near Price, Utah, recently broke and caused immense damage for many miles.

The Eastern Idaho Grazing Association has sold its clip of 110,000 fleeces at 50¼ cents per pound.

The Inland Empire Dairy Association of Eastern Washington has established a paper of its own.

Stockmen of Arizona are watching the fight on the 15 per cent freight rate increase at Washington.

Many thousands of dollars are lost by the grain growers of the Northwest because of smut injury to grain.

Idaho sheep ranches are often provided with feed barns with good roof and sides built entirely of sagebrush.

Fruit growers at Walla Walla, Washington, are erecting immense dryers to handle all the surplus fruit output.

The Northwestern Fruit Growers' Association has made a strenuous fight against the 15 per cent freight increase.

A wool grower at Walla Walla, Washington, has just disposed of his 31,000 pound spring clip for nearly \$15,000.

Appeal is made to Arizona owners to keep posted on prevailing live stock prices and not sell too quickly, as has often been the case.

Experts in agriculture have observed wastes on Washington farms which they estimate to be at least \$25,000,000 annually.

Demonstrations of pit silo construction have been given by County Agricultural Agent Ballantyne of Graham County, Arizona.

O. G. Simpson, formerly professor of dairy manufacturers in Oregon College, has resigned to manage the Oregon Cooperative Dairy Exchange.

State officials of Washington have opened an employment agency and report that the office is swamped with applications by those desiring employment.

Cattlemen on the ranges of New Mexico are hiring Indians to grub loco weed which is proving even more destructive than usual this year. Twenty-five cents per hundred pounds is paid the Indian.

Miss Grace I. Tufts of Phoenix has been appointed assistant to Mrs. Salisbury, state leader in home economics of the Arizona university extension service. Miss Tufts will have headquarters at Phoenix.

The state tax commission of Arizona has called a meeting of county assessors and boards of supervisors at the court house at Nogales the week of July 23. The object of the conference is to secure information on property valuations.

## Get Rid of Worms!

Many animals, especially hogs, are troubled with worms. When your hogs are unthrifty, you hear a little cough now and then, suspect worms.

## Dr. Hess Stock Tonic

**Keeps Hogs Healthy**

**Expels Worms**

So sure am I that Dr. Hess Stock Tonic will keep your hogs healthy and expel the worms, that I have authorized my dealer in your town to supply you with enough Tonic for your hogs and, if it does not do all I claim, just return the empty packages and get your money back.

My Stock Tonic is not a feed, but a true conditioner and tonic, highly concentrated, which contains blood purifiers, laxatives and drugs which are powerful worm expellers. Feed in small quantities, watch your hogs improve.

**NEVER PEDDLED. SOLD ONLY BY DEALERS.**  
28,000 reliable dealers in U. S. handle it. Why pay the peddler twice my price?

**25-lb. Pail, \$2.25; 100-lb. Sack, \$7.00**

Smaller packages as low as 65c. Valuable stock book mailed free, if you write for it.

**DR. HESS & CLARK, Ashland, Ohio**

**Dr. Hess Poultry Pan-a-c-e-a**  
conditions fowls, makes hens lay and is a great help at moulting time. Valuable for chicks, for pullets starting to lay and for all grown fowls. Costs a penny for 10 fowls per day. 1½ lbs., 25c; 3 lbs., 50c; 7 lbs., \$1.00; 25-lb. pail, \$3.00. Guaranteed.

**Dr. Hess Instant Louse Killer**

A reliable lice killer, very quick acting. For use on poultry and stock. Use by dusting and sprinkling. Destroys bugs on cucumber vines, cabbage worms, slugs on roses. In handy sifting-top cans. 1 lb., 25c; 3 lbs., 60c. Guaranteed.

Write Dr. Hess about any sick animal or live stock trouble, enclosing 2c stamp. He will advise you free.

## The Draft Horse Situation in California

Written for California Cultivator By Prof. J. I. Thompson

THE breeding of horses in California is on the decline. To the casual observer it probably appears that there is something radically wrong here for the state stallion board report shows a decrease of about 25 per cent in the number of pure bred sires used in the past year. A casual survey of the situation should be worth while.

The first cause of this decline is that the class of farm labor grows worse from year to year so that ranchers find it increasingly expensive to work mares in foal. The rough, ignorant handling causes many cases of abortion and the loss of too many mares.

The second cause is the prevailing custom of working big teams of six, eight or ten, and even 32 on a combined harvester. Hitched in this manner a mule is much more efficient for he takes to this hitch more naturally and knows better how to look out for himself when the temperature goes extremely high. After harvesting is over many mule teams can be hired out for construction work, and it would be

the regions where the orchards, vineyards and groves are most numerous.

There are really only two large cities where many draft horses are needed, San Francisco and Los Angeles. Even here the drafter finds it hard to hold his own for there is never any snow, so trucks can run every day in the year. The hills of San Francisco might seem to be something of a drawback for trucks, but such is not actually the case for a peculiar reason. The fog often makes the streets extremely slippery, and since automobiles are so numerous there it is less hazardous to pilot a truck among them even on slippery pavement than it is a four-horse team hitched to a big, heavy dray wagon. The largest draying firms in San Francisco state that the trucks, except for the long hauls, are not so economical as the horses, yet an increasingly greater number can be counted each year, due in considerable part to the condition mentioned above. While the number of heavy drafters used in these two big cities is still considerable and probably always will be, the market is a comparatively limited one from the

Efficient Power  
Percherons are Dependable and Economical

folly to intrust good draft teams, especially mares, to the handlings of such teamsters as would there be encountered.

If the type of farming provided steady work for teams and drivers on the same ranch throughout the year the above condition would gradually disappear.

The other type of farming on vineyards or orchards also employs many mules for they are not only satisfactory at swinging around the vines, but work under the branches of the trees and close to the trunks more satisfactorily than horses. The average draft horse is too tall for orchard work, and while a farm chunks type will do the work satisfactorily, they seem to be rather scarce, with the result that mules often fill the places. Unless the type of hitch for ranch plowing changes from six or eight strung out to four abreast the big drafter would seem to have little chance of replacing the mules.

When more power is needed the tendency is to buy a tractor. Since the year's ranch work is done in a rush for about two month's time at seeding and two months' time at harvesting, there is no work for perhaps two-thirds of the stock during the other eight months. Here is where the tractor gets in strong. It can be run day and night for plowing and seeding and for hauling grain to the warehouse, and when not working it is not eating. Handy little orchard tractors are now used extensively in

rancher's view point. The demand just now is quite good for the big ones, but they are not to be found to any very great extent, due to causes which will be mentioned later.

Standard breeds and thoroughbreds were formerly very numerous here, and as the demand for these for racing declined ranchers employed many of them for raising mules. The produce is not especially heavy, but is handy and active and seems to suit the trade. It would seem that it might be profitable to use more heavy draft mares for mule production, and this is being done on the ranches where farming is somewhat intensive, and especially where alfalfa is grown.

There is one enormous factor, however, that materially reduces the price received by the producer for his horses, and that prevents the comparatively limited city demand being filled by California grown horses, and that factor is side bones. Whether this is due to the bringing in of stallions which sired colts with a predisposition to this unsoundness, or to the long dry summers when the heels and, in fact, the entire hoof contracts badly, or the hard roads which make it compulsory to keep all horses shod that do any road work, or to all three of these combined, it is difficult to state. The fact remains that side bones have taken the profit out of much of the draft horse production here and compelled city buyers to go east for much of their stock. Improper or insufficient feeding has

often resulted in lack of sufficient size to fill the city demand, but side-bones have the floor by at least four to one. Still a considerable number of ranchers have bought one or more pure bred mares and started in to breed draft horses under good farm conditions. Many of them have quit disgusted for the following reason: It seems that most of the stallions sold by dealers are never transferred from the dealer to the buyer. The owner of pure bred mares patronizes one of these stallions and often pays an increased fee because his mares are registered. When he attempts to register his colts he finds that his certificate of service is not acceptable to the registry association because the stallion still stands on their books in the name of the original seller. Registry associations of all breeds of all classes of stock can do an untold amount of good by compelling the

seller in all cases to furnish and record the transfer of the animal at time of sale. This is one thing that must be done before draft horse breeding on the average ranch in California will be on the ascendancy instead of the decline as at the present time. It is just possible too that the extremely heavy draft horse will never be so popular here as the medium weight drafter of from 1600 to 1800 pounds, possessing an abundance of quality and true snappy action. Such a horse can be grown under average conditions here and will furnish the keenest competition for the mule and the tractor. He may be at a slight disadvantage when the thermometer soars above 110 degrees, but he will more than make up for this in economy of repairs and reproductive ability when compared with the tractor and truck and the near machine, the mule.

## Breed More Horses

**T**HE COUNTRY needs more horses. There may be difficulties as outlined by Prof. Thompson in the article above, but so far as possible California should meet the demand. In the publication of the Percheron Society of America there are estimates of horse breeders and others. One breeder says:

"As I try to predict the future by what has happened in the past, I can't see how anyone dare say that we are likely to have an overproduction of good draft horses. I am told that the last census report shows that in 1910 we were producing less than ten colts for every 100 horses owned on farms, and it is a safe assumption that horse breeding has declined somewhat in the last seven years. With this war using horse flesh by the million dollars worth, coupled with the fact that there is already a shortage of good heavy horses, the kind which are so necessary in carrying on farm operations most economically, I am sure that farmers can do nothing better this spring than to breed every mare old enough to the best draft stallion available. A horse famine is bound to come unless conditions change. By the time our 1918 colts are old enough to go into the harness this war will likely

be over, and whenever it is, thousands of heavy draft horses will be needed to go to Europe to rejuvenate her agriculture. America, alone, is the only nation in the world with the kind of equine stock that will satisfy this demand. They who can see far enough ahead to appreciate this situation will reap the benefits."

A veteran dealer in horses voices his opinion as follows:

"From the information I have received from many other professional horse buyers, and from my own personal observation, I know that there is a decided shortage of heavy draft horses weighing 1600 pounds or over in working condition. The supply of these horses has never been equal to the demand, and the shortage is more acute now than ever before. Farm and city needs, export trade, and the requirements of the United States army are now drawing upon our available horse supplies at an unprecedented rate, and there is no question, in the judgment of the men best informed on horse production, but that we will encounter a greater shortage of horses and very much higher prices, especially for heavy draft horses, in the next five or ten years than we have known at any time during the last three decades."

## Horse Still Indispensable

The news bulletin of the Colorado agricultural extension service has this to say about the horse:

The very heavy advertising which has been done by our tractor manufacturers during the past few years has led a large number of farmers to think that the tractor is to take the place of the majority of horses on our farms. Unless the breeding of horses is continued and increased we shall, within four or five years, face a horse shortage which will place horse power beyond the average farmer's reach, and curtail our field operations to a remarkable extent.

Wm. Henderson, a prominent horse buyer of Illinois, says "That tractors have a place on our farms I do not deny, for nearly all of our best types of farms now require a power unit which can be used for grinding grain, baling hay, filling silos, grinding alfalfa, and for various other belt power purposes. Inasmuch as the work oftentimes is done upon different parts of the farm, it is an advantage to have a power unit in tractor form, but those

who believe that the tractor is destined to displace any considerable portion of the horses actually needed in field work will find that they have misjudged the situation, and not a few of them will pay dearly for their experience."

### WHAT A HEREFORD MAN SAYS

To the Hereford is due the credit for having not only revolutionized the range cattle business of the country, but the business of growing beef cattle on the farms as well. The transformation of the original Longhorn of the Southwest, which produced a 500-pound carcass at four years of age, into the modern Whiteface that produces a 700-pound carcass at 18 months of age, was the work of the Hereford. The transformation of the gaugling, raw-boned, slow-growing farm steer that could not be matured into palatable beef until it was three to four years old, into the short-legged, smooth, compact, early-maturing steer of today that can be made into prime beef as a yearling, was the work of

# HOT WEATHER

the season when a

## DE LAVAL SEPARATOR

saves most over  
any other separator  
or skimming system

**I**T'S A GREAT MISTAKE for any dairy farmer without a separator or using an inferior machine to put off the purchase of a New De Laval Cream Separator in the summer months especially with butter-fat at the present unusually high price.

Great as are the advantages of the New De Laval over all other separators, as well as over any gravity setting system, at every season of the year, they are even greater during the mid-summer season than at any other time.

This is because hot weather conditions occasion greatest butter-fat losses with gravity setting and render it most difficult to maintain quality of product with any gravity system or unsanitary separator, while, moreover, the quantity of milk is usually greatest, and any loss in either quantity or quality of product means more.

Then there is the great saving in time and labor with the simple, easy running, easily cleaned, large capacity New De Laval machines over all other methods or separators, which naturally counts for more at this time of the year.

Hence the great mistake of putting off the purchase of a New De Laval Cream Separator in summer, whether you already have a poor machine or none at all, and every dairy farmer should keep in mind not only that a De Laval will pay for itself in a few months but may, if desired, be bought on such liberal terms as to actually save its own cost while being paid for.

Every claim thus made is subject to easy demonstration, and every De Laval local agent is glad of the opportunity to prove these claims to you, in your own dairy, without cost or obligation on your part.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for new catalog or any desired information.

Every New De Laval is equipped with a Bell Speed Indicator.

the Hereford. The effect of the Hereford upon the industry of beef production in this country has been two-fold—the improvement which the infusion of Hereford blood has wrought, and the improvement in other breeds of cattle made necessary by the competition of the easy keeping, early-maturing Hereford.

### HOG WALLOW

Written for California Cultivator  
By H. J. Baade

The accompanying picture is of the hog wallow which Mr. Tubbs has constructed on his ranch near Calistoga. He used cobblestones for the bottom and sides, using a mortar between these stones of 1 to 3 cement and sand. The tank is 14 inches deep on one end while on the other it tapers to nothing. It has a flush pipe at the

bottom and a faucet at the upper end where there is a trough into which water runs continuously, thus assuring the hogs fresh drinking water at all times. The overflow goes into the wallow, into which some disinfectant or oil is poured from time to time which will control the lice on the hogs. Mr. Tubbs finds that he is not bothered in the least with any insect parasites on his hogs since he has installed these hog wallows. He finds them entirely satisfactory.

Perhaps the readers of your paper would be interested in knowing of this very necessary addition to the equipment on the hog ranch.

NOW IS THE TIME TO BUY JERSEYS  
**C. G. McFARLAND - Tulare, Cal.**

## Field Notes from the Live Stock Men

The Timken Ranch Company of El Centro has purchased the third prize senior yearling Duroc-Jersey boar at the National Swine Show. The price paid for this boar was \$90.

J. E. Peck of Brawley reports a splendid crop of Duroc-Jersey pigs by his boar Pacemaker, a son of the mighty Pathfinder, the largest boar of the breed.

The Vail Company of Temecula, one of the largest cattle companies in the state, has recently purchased 20 top Duroc-Jersey sows from Peters Lamson & walker. This company expects to go more extensively into the

J. M. Davis, owner of Twin Acres, is the owner of this fine youngster. This ranch won five first ribbons, two seconds and two cups at the show.

Hengerveld Pietertje, a senior four-year-old, belonging to Messrs. Gottshall and Magruder, has just completed a record of 25.3 pounds of butter in seven days on official test.

A. W. Morris & Sons, Woodland, have a remarkable lot of yearly records in the making, and will this season establish several families with great record for both milk and butter for three direct generations, among which will probably be the first three generations of cows to make above 1000 pounds butter in one year. A splendid lot of young things are coming on in the Morris herd at present, and the herd now numbers over 425 head of registered Holsteins. The feeding of pasteurized milk and careful sanitary methods employed in raising the young stock, have resulted in a growthy, vigorous, healthy lot of youngsters that will be real performers when they grow up.

Fred W. Kiesel, Sacramento, president of California Holstein-Friesian Association, is developing a splendid herd, and the first test season has brought out a string of creditable records in his herd. Some exceptionally promising heifers will freshen for the first time this fall and there will be a large class to go on official test. Mr. Kiesel's ranch on the river is really a 600 acre garden, such is the richness of the soil, and at this season a tremendous crop of alfalfa is being harvested, while a big crop of corn for silage is coming on and a banner bean crop is growing.

Roselawn Stock Farm, Woodland, is gradually increasing its splendid herd of registered Shorthorn breeding cows, although nowhere near in keeping with the demands for breeding stock made upon this popular herd. Their senior herd sire, Gibson's Goods, recently passed to bull heaven, leaving behind him a large group of offspring that is a credit to California Shorthorns. The junior herd sire, Ringleader, son of the great Ringmaster, is also siring a great bunch of calves with remarkably good top lines and general excellence and quality.

If Thornton Glide, owner of Hillcrest Stock Farm, Davis, elects to show registered Shorthorns at the California State Fair, or any other fair for that matter, this year, just watch the heifer classes. There will be some young things worth seeing, and if they do not reach the top there will be some classes worth going a long way to see.

Horses to bring the best possible price on the market should be in good condition, that is fair flesh and showing evidences of care and attention. Special attention should be given to feed and grooming. Each pound of flesh put on the thin horse means an increase in the selling price up to a certain limit.

Secretary Wayne Dinsmore of the Percheron Society of America writes that the society offers many valuable prizes and medals for 1917 fairs. Lists of classes and prizes may be secured by writing him at U. S. Yards, Chicago. The California state fair is one of those given complete recognition.

Go to the first cholera inoculation demonstration in your community. Learn how to administer the serum. Cholera may break out in your herd next week.

### Horse With Cough

About four months ago horse seemed to take cold, right eye discharged and the cough was only occasional. Cough has been growing worse slowly and seems to be worst during the night. Some difficulty at times in swallowing and breathing. Feed rolled barley and bran and bean straw for roughness. Cough same, whether on dry feed or in pasture. It is not distemper, as there is no discharge at nose nor swollen glands. Cough is dry and hard, almost as if choking at times. —Subscriber, Encinitas.

Your description of cough would lead one to think it might be the heaves, but the difficulty in swallowing indicates a sore throat also. For the sore throat get four ounces of tincture of iron and once a day put half an ounce of it in a long neck bottle. Add a cup of water and drench him slowly with it. For the cough get these powders: Four ounces powdered belladonna leaves, four ounces powdered digitalis leaves, two ounces powdered nuxvomica, four ounces ground gentian, two drams arsenious acid and six ounces farina. Mix. Give a heaping teaspoon of the mixture morning and evening in some kind of ground feed.

### Skin Disease

I have a young horse that has had the itch for over a year. An old horse had same trouble, caused by mites getting on him, in the same stable about three years ago. It breaks out in small blisters and sometimes the hair comes off when the blisters break. It bothers him most in summer. Have used the usual skin remedies, but they do no good. —Subscriber, Buena Park.

Better treat him both internally and externally, and you will be pretty sure to reach the trouble. Get a pint of Fowler's solution of arsenic. Give half an ounce as a drench or on the feed once a day for a week, then increase the dose to one ounce a day for ten days and finish by giving half ounce doses while the pint of medicine lasts. For external treatment clip him all over, then once a day for a week wet the irritated parts with a solution of chloride of zinc, using one ounce to the gallon of water. It will do more good if warmed just before using. The stable should be thoroughly swept out and whitewashed, as well as the places in the corral where he rubs.

### Spanish Itch

I have a work mule that is troubled with what is known as "Spanish itch" in this section. The disease commences to show as soon as warm weather comes in the spring. In this case it appears on the head and neck and along the back to the base of the tail. The itching is so intense the corral fences do not last long under the vigorous rubbing. Have used kresol dip, but it does no good. Think he needs some internal remedy. In a recent issue of the Cultivator, Fowler's solution of arsenic was recommended as an external wash. Our druggist says it could be made cheaper by leaving out some of the chemicals and be just as effective. Please advise how much to get and how to use it. —Subscriber, Blythe.

If you will read the article you refer to in the Cultivator again you will find that the Fowler's solution of arsenic was recommended for internal use and should be given in one ounce doses once a day. It is

best to begin by giving half ounce doses once a day for a week and terminating the treatment in the same manner. Get one pint of it and it will last about three weeks. Use the arsenic treatment as above, and for external treatment for the mule I would advise trying a solution of chloride of zinc, two ounces to the gallon of water. Scrub the parts clean once with soap and warm water, and when dry apply enough of the solution to wet the parts. Repeat the lotion once a day. This will cure most skin diseases, but if it fails then try soaking the parts with a light grade of engine oil, such as you can get at any garage. Show this to your druggist so he will know just how to prepare the remedies for you and ask him for an ounce vial for a measure for the arsenic solution.

### How to Drench a Cow

A subscriber writes that one of his cows was ailing and he gave her a pound of salts and repeated it the next day, after which she improved some, but, thinking that another dose of the salts was needed, he gave it. The cow did not want the last dose, but her head was held up and the medicine forced down, after which she commenced breathing hard and died that night. Upon opening her he found a dark spot at the end of the lungs. He asks if it was the salts that did it.

Probably the head was held in such a manner that she could not swallow and part of the dose went down into the lungs. If the whole dose had gone into the lungs she would probably have died in a few minutes.

When drenching a cow the head should not be held too high, and there should be no pressure on the throat to prevent swallowing. Also the head should be held straight out in front of the body and not too much medicine poured into the mouth at one time. Usually cows are very easy to drench, but occasionally one will resist, and then care must be exercised or the medicine may be forced into the lungs. Once the medicine is in the lungs there is little or no remedy for it. The thumb and middle finger in the nostrils to serve as a bull ring will generally make them hold up the head and take the medicine with little or no resistance.

### Heifer Giving Milk

I have a heifer due to freshen next September that will be two years old in December. She has been brought to her milk by calves that I supposed were weaned. She is very fat and milks very freely. I am trying to dry her up by feeding her only alfalfa hay and keeping her in a corral by herself. I only milk her when the udder is full, which is about twice a week, but she still has to be milked. Is there more danger at time of freshening in this condition? —Subscriber, Modesto.

She was bred too young, but now that things are started keep them going. Do not dry her up; it may make more trouble. She will come fresh just as easy and there will be less danger of udder trouble if you keep the milk flow right up. All these things coming together when she is so young may stunt her growth a little, but she will probably make just as good a cow. Milk her at least once a day.

A creamery with equipment valued at about \$15,000 was burned at Chowchilla. The plant will be rebuilt.

## We will Reward You With This Great Book

Everybody can have a copy under our liberal offer. Send for yours today.

### Greatest Book on Feeding.

"Feeds and Feeding", by Henry and Morrison, is the recognized standard authority on the feeding of dairy cows, beef cattle, calves, hogs, horses and sheep. The authors at great expense and with much time and labor, have compiled the most important findings of the investigators of both the Old World and the New in the science of animal nutrition, together with the vast number of feeding trials, conducted in California and the experiment stations of other states, the whole being rounded out by the practical experiments of many of the leading stockmen of America.

### Latest Edition.

This is the latest edition containing the new chapter "Economy in Feeding Live Stock" and much other information recently found by investigators in this and other countries.

701 PAGES—Cloth bound and full of Valuable Information

## How to Get Best Results Feeding California Barley

"Feeds and Feeding" is a large volume, 701 pages in substantial cloth binding, clearly printed in large type and written in plain, understandable language. It is intensely interesting throughout and represents the sum total of hundreds of experiments, trials, and record tests on practically every feeding combination ever attempted and the personal experiences of the authors and many other noted feeding experts from California to Maine.

Full and complete information is given in regard to the feeding and feed value of California barley, how to obtain the best results, and giving the results of many barley feeding tests. (Pages 162, 308, 309, 360, 414, 454, 525, 590.)

## We Are Going to Give These Books Away

READ OUR OFFER TO YOU

If you would know feeds, their value, what to feed, and how, get this neat book, that thoroughly covers the subject. With the information it gives at your command, you can cut many dollars from your feeding cost.

### Only takes a Little Time.

You can obtain one of these valuable books at no expense—just a few minutes' easy work. To any reader of California Cultivator who will secure for us only three new yearly subscriptions to California Cultivator at \$1.00 each—the regular subscription price, we will send a copy of the latest edition of "Feeds and Feeding" by Henry and Morrison. If you want to buy this book it will cost you \$2.25 anywhere. You know California Cultivator and how much valuable information you get from its columns each issue. You receive the best thought and experiences of many of the West's most authoritative writers. The results of many tests and experiments and the live stock, dairy and agricultural news of what is going on over the entire Pacific Coast at a cost of only \$1.00 per year. Your neighbor, if he is not already a subscriber, will be glad to have you show him a copy. You can get three new subscribers at \$1.00 each quickly and easily. Send us the \$3.00 and the subscribers' names and addresses and we will send the book to you postpaid. You may include your own subscription by paying a full year in advance of this date and including two new subscriptions at \$1.00 each. There must be at least two new subscriptions for one year.

## THE WAR'S CHALLENGE TO THE SIDE-LINE POULTRY-KEEPER

Continued from Page 3.

What we do know is that a shortage of food may confront us sooner than we dare to think and that then a little flock of hens, supplying eggs and meat for the family, will be a resource of almost priceless value. If it can be made to supply more than the family needs, it is of still greater value. Not every one can raise his own vegetables. Knowledge and experience are important factors in the garden game; birds, gophers, hot weather, cold weather, lack of water and poor soil are all to be reckoned with. But a person must be very ignorant or very stupid who cannot make half a dozen hens a financial success and a welcome asset in the home economy. Weather counts but

little with hens, and they will eat anything a cow, a dog or a human being can. Give them a tree to roost in, the refuse from the kitchen, a little grain and a chance to forage for what is lacking in the ration, and you will have some eggs. Give a comfortable roosting coop, a balanced ration and strict attention to cleanliness, and Mrs. Biddy will do her level best to fill the egg basket.

If the side-line poultry keeper is to do his part in helping out the nation's food supply, and incidentally his own, he must do three things which side-liners have not always been willing to do:

First, he must keep better stock. In the past too many have been satisfied with anything that would lay eggs, without regard to color or breed or breeding. The mixed, mongrel flocks in our back yards must go. A mongrel rarely lays as many eggs as a pure bred, and the second generation never does. Half a dozen hens of one pure breed, mated to a male with real breeding back of him, is a basis for the building up of a strain which shall be a real asset to the community. Should the time ever come to us, as it has already come to European countries, when the preservation of breeding stock is a serious problem, these little backyard flocks of pure bred birds will be of incalculable value.

Second, he must look more to meat quality in his birds. Our great need for the next few years is to be meat, and no meat save rabbits and pigeons can be so quickly raised as chickens. But the fowl that is worth while for meat must be one that reaches marketable size quickly and that when mature has a good plump breast and fairly heavy weight. These qualities are not always found in conjunction with high fecundity, but they may be. Some strains of heavy hens are quite as good layers as Leghorns; some, their admirers say, are better. This is not an argument against the Leghorns, but a reminder that we must look for and breed toward both eggs and meat in our fowls.

Third, he must study food conservation for his hens as well as for his family. What feed gives most nourishment for least money? What will make eggs and not make fat? How much does a hen need in order to produce the eggs required of her? What ought it to cost to produce a dozen eggs? These are vital questions which professional egg producers have been working on for years. It is time the side-liner took a hand at their solution.

Fourth, he must plan to raise more of the feed he uses. What one can raise depends, of course, on the amount of land he can command, but even the back-lotter can usually find

a place for a patch of milo or kafir, as well as for the rape and kale which his hens must have. The successful poultryman, commercial or side line, must raise more feed than he has ever raised before. The time may come when we shall no longer be permitted to feed hens grain which can be used for human food. Then the sorghums, of which milo is one, must be the main dependence of many poultry keepers. These grains may be raised on any vacant lot with little water, and it is up to us side-liners to learn without delay how to raise them, and then to raise all we can. This sounds easy, but it is not as easy as

it sounds. I planted a patch of milo this spring, and only a few stalks came up. Whether the birds stole the seed, or the ground was too dry, or the planting too shallow, or the seed poor, I do not know, but I am going to find out. It takes time to learn to raise even sorghums, which are said to be the most easily raised of all grains. No poultry keeper, whether he keeps a dozen hens or a couple of thousand, is properly equipped without a smattering, at least, of general agricultural knowledge. Which brings us right back to what J. H. Robinson said years ago, that the poultryman is only a farmer after all.

## Rabbits the Solution of Increasing Meat Production

By C. P. Gilmore, Western Secretary National Rabbit Association

WITH our country at war and our government calling on every one to produce food-stuffs, there is but one thing that can happen to the rabbit

industry of this country, and that one thing is something little short of a boom. Never before in the history of the industry has there been the demand for rabbit meat, and never before have there been such prices paid. Breeders all over the country report that they cannot fill the orders.

Secretary Houston of the department of agriculture declared recently that "Unquestionably the largest hope for a considerable increase in our meat supply lies; first, in sympathetic attention to the production of larger animals in the settled farming areas of the country, and second, in increasing attention to smaller animals.

The increasing attention to the smaller animals has been very evident during the past few years but with chicken wheat at five cents a pound, this leaves "Bre'r Rabbit" king of the field of small meat producers.

We maintain that rabbit meat is the cheapest to produce (pound for

pound) of any meat that we eat, and while I do not advise it, still if it comes to a show down rabbits can be raised on dry grass, good greens and water.

France is producing and selling through its municipal markets over 100,000,000 rabbits yearly. Before the war Belgium earned from her exportations of rabbit meat approximately \$12,000,000 yearly.

Prof. Pennant, a Norwegian sociologist, states that he thinks the rabbit is the solution of the meat question of his country. He points out that the rabbit will supply in many ways the poor man's food. The poor man can easily raise them; they are cheap to keep, and the propagating power is most extraordinary, he says.

As a present day meat producer I regard the rabbit (Belgian, New Zealand and Flemish breeds), as worthy to head the list. First, for delicate flavor and digestibility; second, cheapness of production; third, small amount of space required; fourth, small amount of time required; and fifth for the fact that they belong to the rich and poor alike.

## Produce Infertile Eggs!

Infertile eggs keep best and market best in summer heat. Fertile eggs spoil quickly in summer weather. Fertile eggs cost the farmer an enormous sum each year. Farmers lose millions of dollars annually from bad methods of producing and handling eggs. One-third of this loss is preventable, because it is due to the partial hatching of fertile eggs which have been allowed to become warm enough to begin to incubate.

The rooster makes the egg fertile. The fertile egg makes the blood ring. You can save the money now lost from blood rings by keeping the male bird from your flock after the hatching season is over. The rooster does not help the hens lay. He merely fertilizes the germ of the egg. The fertile germ in hot weather quickly becomes a blood ring, which spoils the egg for food and market. Summer heat has the same effect on fertile eggs as the hen or incubator.

Infertile eggs will not become blood rings. After the hatching season cook, sell, or pen your rooster. Your hens not running with a male bird will produce infertile eggs—quality eggs that keep best and market best.

### Rules for Handling Eggs on the Farm—

Heat is the great enemy of eggs, both fertile and infertile. Farmers are urged to follow these simple rules, which cost nothing but time and thought and will add dollars to the poultry yard returns:

1. Keep the nests clean; provide one nest for every four hens.
2. Gather the eggs twice daily.
3. Keep the eggs in a cool, dry room or cellar.
4. Market the eggs at least twice a week.
5. Sell, kill, or confine all male birds as soon as the hatching season is over.

### The Best Feed on the Market

Has the highest protein at the lowest price, \$2.65 per 90-lb. bag, subject to market changes; see that your hens eat as much Dry Mash as they do grain; feed them lightly of grain in the morning and make them work for it; either have a scratching pen or spade up a part of the ground and rake the feed under; keep "A-1" Dry Mash in a dry form before them all day; about one hour before feeding them their grain in the evening WET their Mash and let them eat all they will; put it on top of the Dry Mash, then feed them all the grain they will eat; this stuffing process will give them a full crop to carry them through the long night of inactivity; analysis is printed on every bag; give it a trial. At Your Dealers or

The Globe Mills, Los Angeles

**Mr. Poultryman:** TRI-STATE MOULT MASH will help your hens through the molt and make it possible for you to stay in the business. SOLD by our agent in each town or inquire of GLOBE MILLS, LOS ANGELES, Southern Wholesale Distributors, or TRI-STATE POULTRYMEN'S COOPERATIVE ASS'N., Headquarters, Fresno, California.

## Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 31,000 readers, weekly.  
Liner rates: Single insertions 3s per word;  
yearly contracts 2½c per word. 35c per issue minimum charge.

### TREES

**For Sale**—7000 Eureka lemons, 500 Washington Navel orange trees, budded from selected buds, on sour root in May, 1915. Very healthy, clean and uniform. Will calliper around one inch. No better trees anywhere. Price 15c per tree in the ground at San Dimas. W. B. Richards, 935 N. Park Ave., Pomona. Phone Pomona 6302.

**Valencias**—Good, clean, thrifty, 2-year-old stock. These trees have never been neglected and are as good as the best. 45c each balled, dipped and loaded on truck at Glendora if taken in lots of 250 or more. C. A. Stoddard, Whittier, Cal.

**Here is Your Opportunity to Secure A1 citrus trees.** We offer several thousand 2-year-old lemons; Eureka and Villa Franca, also Washington navels; also several hundred Valencias on sweet root. We call these good trees and we know whereof we speak. ALBERT JACKSON, Upland, Cal.

**For Sale**—15,000 "Sweet Root" Valencia orange trees, choice yearling high buds, very thrifty stock raised from seeds of largest seedling orange trees in California. E. W. Pyne, 4 miles N. E. Olive, Orange County. Phone Placentia, 2333.

**By Far the Lowest Priced means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator.** The cost is only 3 cents per word per issue, with a minimum of 35 cents.

**For Acacias, Avocados, Budded Loquats, Citrus trees, Evergreens, Feijoa, Palms, Roses and all kinds of trees, shrubs, vines, etc.** Write for our new catalogue. Robertson Nurseries, Fullerton, Cal.

**For Sale**—Two-year sour seed bed stock, thrifty with good roots. Only 20,000. Price \$20 and \$25 f.o.b. Be quick if you expect to plant. C. W. Wilhite, Glendora, Cal. Phone 303.

**For Sale**—1000 Eureka lemon trees at 25c per tree. First class, free from scale; ½-inch and up must take them out this spring. Peter Arth, Redlands.

**Citrus Trees**—All kinds, any quantity. Butler's Morning Side Nursery, Lamanda Park, Cal.

**Citrus Nurseries**, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

**Quality Trees**—Prune trees 10c each. Cash Nurseries, Sebastopol, Cal.

**For Sale**—1-year-old Sour Florida Seed bed stock. A. R. Klemm, Azusa, Cal.

### WANTED

**Wanted**—Man in each California county to represent established California company. Should have rig or auto to get around. Good pay and several weeks' work to right parties. Address J. H. Yetter, Sales Department, 810 Santa Marina Building, 112 Market St. San Francisco, Cal.

**One of the Most perplexing problems to farmers and ranchers is that of help. A small liner ad in California Cultivator is the quickest and easiest means of securing farm help.**

### SEEDS AND PLANTS

**Tepary Beans for Sale**—Twelve pounds will plant an acre. Will mature in 65 days from seeding. Seed very scarce. We have on hand a limited quantity which we offer, ten pound lots at \$2.50; hundred pounds \$20.00 F. O. B. Tucson. Tucson Seed Company, Dry Climate Seeds, Tucson, Arizona.

**Giant Winter Rhubarb**—Last chance to get extra fine subdivisions at special low prices; offer expires June 30. \$673.70 from ½-acre first season. Grand prize San Diego Exposition. Booklet free. W. A. LEE, Covina, Cal.

**Six Sacks Sudan Grass Seed**—Absolutely pure. For quick sale 40 cents per pound. Imperial Valley Seed House, El Centro.

### CAPRI FIGS

**Capri Figs ready now.** Place your order at once. Early and late varieties. Price \$6.00 per thousand. Quality good, satisfaction guaranteed. L. C. Collins, Smvrna Park, Ceres, Calif.

**Capri Figs Ready July 5th to August 10th.** Well colonized. Tribble Bros., Elk Grove, Calif.

### HORTICULTURAL PRINTING

**Catalogues**—Good Printing. Specialists in preparing nursery, seed, poultry and live stock catalogues and all kinds of commercial printing. For prices and information address WOLFER PRINTING CO., 115 No. Broadway, Los Angeles.

### RABBITS

**Raise Rabbits For Us**—We sell you foundation stock and buy back what you raise, paying \$1.75 and \$2.00 each for them. Send 25c for our proposition, our book on rabbit culture and our supply catalog. Gilmore's Rabbit Farm, Dept. C, Santa Barbara, Cal. (The rabbit farm of international reputation.)

### FOR LEASE

**For Lease**—2500 acres good grain land in Merced County, close to railroad; will lease to responsible tenant for share of crops or cash. Address C. H. Evans, 536 Title Insurance Bldg., Los Angeles.

### FOR EXCHANGE

**For Exchange**—A 5-acre chicken ranch at Upland. 1200 White Leghorns. Chicken houses with cement floors. Good house, bath and toilet. Will take clear house Los Angeles or good nearby town. Mortgage \$2000, nearly three years to run. A big snap, but must be turned quick. A. W. Richards, Claremont, Cal.

### HOGS

**Chester Whites, the Billiken Brand**—Bred sows and gilts. Every rancher should carry at least one good brood sow; are you going to help out our future meat supply? I have the following to offer, first class in every respect and priced low: 2 young tested sows to farrow in July; 6 spring gilts to farrow in September; 18 fall gilts to farrow in October. Weaned pigs, both sexes, to be delivered during the month of June; 4 young boars ready for service. Write for prices and circulars. C. B. Cunningham, Mills, Cal.

**Grape-Wild Farm Berkshires**—World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

**Large Yorkshires**—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

**Superba, World's Grand Champion Poland-China** boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

**Rancho Rubio Durocs.** Only a few September gilts left. One coking good fall boar by Orion Model, son of the last international grand champion. Place your orders now for weaned boar pigs. Best I ever raised. Elmer Lamb, Ceres, Cal.

**Wanted**—Farmers, orchardists, livestockmen to use classified liner advertisements like this. Thousands of people read every ad and the cost is only 3 cents per word per issue, minimum 35 cents. Extra lines of white space above and below cost only 16 cents per line.

**Large Type Poland-Chinas.** Have ready for shipment three spring yearling boars, three fall pigs, spring pigs both sexes. Sired by Glenn Chief, a 1000-lb. boar, and out of prize winning sows. Cremer-Erikson & Co., Orland.

**Duroc-Jerseys**—Seven choice males, three months old, from litter of eleven. Guaranteed breeders. \$20 each with pedigree. W. M. Taylor, Rd. 1, San Bernardino, Cal.

**Big Type Durocs.** Well grown out February and March pigs of either sex in any quantity. We ship only the tops and butcher the culls. F. M. Johnson, Napa, Cal.

**Cholera Immune Duroc-Jerseys.** Big type. Weaned boars and gilts from 500 to 700-pound sows. Prize winning stock. Derryfield Farm, I.O.O.F. Temple, Sacramento.

**Duroc-Jerseys**—P. & L. Defender is a son of the Original Defender, his dam was bred by Ira Jackson. Peters, Lamson & Walker, Devore, San Bernardino Co., Cal.

**Crawshaw's California Chinas** are prolific and profitable. Weanlings \$15.00, boars \$25.00. Dr. J. A. Crawshaw, Hanford, Cal.

**Poland-China Swine Recorded.** Stock for sale at all times. We please you or refund your money. W. A. Young, Lodi, Cal.

**Most Money in Duroc-Jerseys.** Bred sows and weanlings, either sex all the time. Delta Farm and Live Stock Co., Colton, Cal.

**Choice Boar Pigs for Sale.** Sired by Superba 220620, champion Poland boar at San Francisco. Prices right. C. R. Hanna, Riverside, Cal.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

**Normandy Farms** herd of Berkshires are now to be found at A-1 Ranch. Write for catalogue. Arlington M. Smith, Visalia, Cal.

**One Large and two medium type boars,** extra choice, 9 and 10 months old. W. Bernstein Ranch, L. C. Trewhitt, Mgr., Hanford, Cal.

**Model Herd Berkshires** bred for size and quality. Weanlings and gilts. J. L. Gish, Laws, Calif.

**Carruthers' Farm Berkshire Hogs.** Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

**Berkshires**—Two hundred pounds at six months. Ray C. Hannan, Corning, Cal.

**Poland-Chinas**—A few good breeding boars. S. F. Williams, Orland, Cal.

### PATENT ATTORNEYS

**Patents that protect are secured through the PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "PATENTS".**

### BEE SUPPLIES

**For Sale**—175 to 250 colonies Italian bees with extra equipment; in eight-frame hives; can remain in present location if desired. Geo. A. Sill, Watsonville, Cal.

### MONEY TO LOAN

**Money to Loan**—On improved farms, city property or for building loans, also on cattle or cotton crops. C. G. Paul, 206 North Glendale Ave., Tropic, Cal.

### LIVE STOCK

**D. E. Kellher,** importer and breeder of Hampshire sheep, Eugene, Cal., offers for sale a choice lot of Hampshire ram lambs, sired by Walnut Hall and Butterfield Rams, purchased at Salt Lake, August, 1916. Lambs ready for delivery after July 15th, 1917. Inspection and correspondence invited.

**Butte City Shorthorns, Shropshires, Berkshires and Ponies.** Stock of all ages for sale. Can supply one or a carload. Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn Co., Cal.

**At Last the Perfect Silo—The Stay Round.** No hoops, no bolts. No experiments. Any one can erect. Close price. Address D. O. Lively, 125 Hobart Bldg., San Francisco.

**Registered Shires**—Blackhawk Stock Ranch. Importers and Breeders. Easton & Ward, Burlingame, Cal.

**Pure Toggenburgs**—One mature doe, 1 doe kid, 1 buck kid. H. W. Shepard, National City, Calif.

### CATTLE

**Registered Shorthorns**—Milk and beef strains. Bulls and heifers for sale from record dams and sires, direct from the East. Catalog mailed free. Harrison, London Ranch, Glen Ellen, Cal.

**D. O. Lively Stock Farm, Inc., 215 Hobart Bldg., San Francisco.** Breeders of Hereford cattle. A few choice heifers for sale. We buy and sell live stock on commission. Farm at Mayfield, Cal.

**Registered Holsteins** out of ARO Dams. Grandsons of Pieterje Maid Ormsby, 25.55 pounds average 5.31. Geo. Kounias, Modesto Farms, Modesto, Cal.

**Venadera Jerseys,** the herd with official yearly records. Calves of both sexes for sale. Guy H. Miller, Route 1, Modesto, Cal.

**Young Holstein Bulls,** bred right, grown right, priced right. Creamcup Herd. M. Holdridge, Modesto, Calif.

**N. H. Locke Co., Lockeford, Cal.**—Choice young Jersey bulls for sale.

**Holstein Bulls** from record cows. Prices right. A. M. Bibens, Modesto, Calif.

### MACHINERY

**WHY BUY NEW? SAVE HALF** Material guaranteed. It's 2nd hand after used few times, but not worn out.

**PIPE** 1000 ft. 7-in. galv. irrigating pipe 29c; 400 ft. heavy riveted 16c; 300 ft. 2 and 3-in. st. galv. pipe.

**WINDMILLS** Let the wind do it. 8-ft. \$25; 10-ft., \$32.50 to \$35; 12-ft., \$45 to \$55. Have three 16-ft. mills, \$125 and \$95, cost new \$285. Pumps as much as 4 h. p. engine for nothing once installed, why buy gas?

**TANKS—TANKS** New and used tanks guaranteed; 1500-gal. galv. with cover, \$22.50; 10,000-gal. galv., \$150; 16,000, \$250; swell heavy 20,000-gal. galv. tank with cover, \$275; 10,000-gal. redwood, \$75. See who's cheapest.

**ENGINES, PUMPS, PIPE.** Centrifugal pumps; plunger pumps, \$5 up; double-acting No. 3 Ames, \$225; cost \$660; Means double-acting deep well pump, \$275; Large Addison double acting plunger pump complete with 85-ft. 10-in. pipe, 9-in. swell brass cylinder, double rods, pumps 50 in. outfit cost \$1500, snap at \$475; 9 h. p. Foos, \$135; 6-h. Stearns, \$89. Many other first class engines very cheap.

Brass cylinders, Plunger rods, pipe, fittings, Ranch Machinery Sundries. Fine 2-gang mouldboard plow, \$45; 3 or 4-gang disc tractor plow; alfalfa renovator, \$25; 24-disc, 4-horse harrow, \$38; mowers, buck rake, \$20; feed cutter, \$8.50; Bulldozer pump jack, \$42; bone grinders, \$6.50 to \$12.50; feed mill, \$16.50; water trough, \$4; cement mixer, \$25; sprayer, \$18.50; new discs, \$1 each.

**Wanted to buy first class material.** No junk wanted. Pioneers in our line. DEMMITT CO., Upstairs, 120 N. Main. Yards, 816 Yale, Los Angeles.

**Several new and slightly used engines** at a bargain. Best makes. 1 to 35 h.p. Arnott & Company, Wholesale Machinery and Implements, 112 South Los Angeles St., Los Angeles, Cal.

### FARM LANDS FOR SALE

**160 Acres,** fenced and cross-fenced, nearly new four room house, barn, out buildings, six big springs, garden, young orchard, near school, store and postoffice. Farming tools, span of horses, harness, wagon, some household furniture, fine climate. Priced for quick sale \$1300. No trades. W. W. Baldy, Raymond, Madera Co., Cal.

**For Sale or Lease**—1000 acres bean land, \$75 per acre. In Santa Fe R. R. within 6 miles of ocean near new government cantonment and within 100 miles of Los Angeles. Might divide or lease to responsible parties for beans. Plenty of water. Address for appointment, Owner, 1236 Citizens Bank Building, Los Angeles.

**For Sale**—25 acres well fenced, good well, good barn and building. Selling below cost. Mail to gate, good road 2 miles east of Napa. Mrs. James G. Pullen, Route 3, Box 78, Napa, Cal.

**For Sale**—At a Bargain, ¼ acre in Civic Center, Atascadero, Calif.; lot 10, N. B. Paid \$1060. In order to get needed money quick will sell for \$530. Carl Storia, Paso Robles, Calif.

**624 Acre Stock Ranch** for sale at a sacrifice. Very reasonable terms. For particulars address J. F. Salcido, Lookout, Calif.

**For Sale**—8 A. improved truck garden and chicken farm only 8 blocks from Post Office in town of 1500. Price \$2500. Terms. Box 117, Anderson, California.

**State, Government and Indian Lands.** Bargains overlooked. Free New Blue Booklet. Joseph Clark, Sacramento.

### LUMBER

**AAA—Lumber,** New and Second-Hand; rough, \$10 M; finished, \$15 "A" R. W. shingles, 45c bundle. Dan P. Dolan, 1639 Mission St., San Francisco, Cal.

### POULTRY

**Poultry Wanted**—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., 607 E. Third St., Los Angeles, Cal.

**200-290-Egg Early Maturing Winter Laying** White Leghorns, White Wyandottes, Rocks, Reds, Anconas, JUNE SALE. Eggs 60 per cent off. Few pens all breeds, half price. 8-week chicks. C. Beeson, Pasadena, Cal.

**Two Pair of Peafowl**—One male has long tail, the other tail is just starting. Females just starting. \$20.00. White Muscovy (quackless) duck eggs, \$1.00 per 12. White African Guinea eggs, \$1.50 per 15. Mrs. B. Hocking, Guasti, Calif.

**Model Poultry Farm,** White Leghorn specialists. Baby chicks and hatching eggs from heavy laying stock, bred by us for thirteen years. Our prices are right. W. C. Smith, Prop., Corning, Cal.

**Baby Chicks**—White Minorcas and Golden Buff Leghorn. Two popular breeds. Cockerels for sale. Sandridge Hatchery, Kerman, Cal.

**Baby Chix**—White Leghorns, White Rocks, "quackless" White Muscovy ducklings. White Star Hatchery, Kerman, Cal.

**"Eastman's Bred-to-Lay"** Barred Plymouth Rocks. Fairmead Poultry Farm, Fairmead, Cal.

### MISCELLANEOUS

**Free for Six Months**—My special offer to introduce my magazine, "Investing for Profit." It is worth \$10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer quickly and honestly. Investing for Profit is the only progressive financial journal and has the largest circulation in America. It shows how \$100 grows to \$2200. Write now and I'll send it six months free. H. L. Barber, 430-28 W. Jackson Boulevard, Chicago.

**If You Have Transportation and Irrigation problems or surveying,** consult J. H. Knapp, Civil Engineer, 220 I. W. Hellman Bldg., Los Angeles. F7810. 25 years' experience in West.

**Slacked Lime**—Send for sample and information. Price right. Let me help you. H. B. Matthews, 350 Woodberry Road Pasadena.

**To Reduce the high cost of living,** send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

**For Sale.** General Merchandise store. For particulars write H. P. Rogers, Meadow Valley, Cal.

### AGRICULTURAL IMPLEMENTS

**Large Assortment** slightly used and agents' sample plows, harrows, cultivators, wagons. Call and see them before buying. Save 50 per cent on some. Four floors. Largest stock. Arnott & Company, Ranchers' Supply House, 112 to 118 South Los Angeles St., Los Angeles.

**For Sale**—Haines-Houser Harvester. Complete with cradle, 22-foot cut; in first class condition; sell cheap for cash. Address C. H. Evans, 536 Title Insurance Bldg., Los Angeles.

### DOGS

**If You Raise or Handle Cattle, Sheep or turkeys,** you need a DOG. Our Collies are the best. Pups just weaned for sale. Address John G. Mee, Breeder of Bronze Turkeys and Embden Geese, St. Helena, Cal.

### A MOVE TO LARGER QUARTERS

The De Laval Dairy Supply Company has moved from the old location at Drumm and Sacramento Streets to a new, fire proof building at 61 Beale Street. The firm came to San Francisco 15 years ago and at the time of the big fire was completely burned out. There was nothing left but a good reputation for fair and honest dealing, which no fire, flood or famine can destroy. After the fire the company found a suitable location where they remained till the completion of the present building.

The company has always been in the front ranks in the battle for better dairying conditions; advocating better cows, better methods of handling the produce of the dairy and better business methods. Improved conditions prevail, not only in California, but along the entire coast, as a result of the efforts put forth by the De Laval Company. During the past two or three years they have been greatly cramped in the old quarters. The dairy business has grown tremendously; new machinery has been placed on the market; new dairies were started and old dairies increased their capacity to meet their individual demands.

The building into which the company has moved is new and of class A construction, is four stories high and includes a large storage basement. The top floor is used for the machine shop and engineering department. On the first floor is a complete stock display, and the second floor is utilized by the big office force.

The company handles dairy supplies of every kind, including Alpha engines, barn equipment, feed cutters, silos, spraying machines, and all other implements. There is nothing too big or nothing too small that the dairyman needs that cannot be supplied by the De Laval Company. Catalogues bearing upon particular phases of the dairy business will be sent upon request.

According to Mr. C. A. Crate, general sales manager, the dairy business bids fair to make great progress during the next ten years. The outlook is particularly encouraging, despite the present high cost of feed, and every dairyman is urged to bridge over the present season without getting rid of any of his cows. They will pay a big return in the near future, and those who sell their herds will have great difficulty in getting back to their present positions.

### CANNING CLUBS

All Over the Country

Have adopted the Burpee Home Can Sealer, because of its simplicity, and the fact that no solder, no acid and no extra equipment are required. Seals Cans airtight. Absolutely sanitary.

### CAN FOODS AT HOME

Put up your own fruits, vegetables, fish and meats. Save your surplus. Don't waste anything. Practice economy. Can everything you don't sell. Then sell these delicious canned foods at a good profit or use them yourself. Satisfaction guaranteed. Write for free book.

### GOD IS GUIDE

"The world is wide  
In time and tide  
And God is guide;  
Then do not hurry.

"The man is blest  
Who does his best  
And leaves the rest;  
Then do not worry."

### SAVING STRENGTH

Written for California Cultivator  
By A. B. C., Pasadena

YOU ask, "What does the saving of strength amount to?" The difference between profit and loss, not in dollars and cents alone, but in all things most vital and worth while.

The urgency of wartime is laying a stress on us all, voluntarily or otherwise. The measure of success or failure depends in a crisis on the margin we possess. To meet this we must take stock carefully, for no saving is too small to count. If it means radical changes of ideas and ideals, we have the advantage that never was a time so easy to get out of a rut. From the president to the humblest citizen we are realizing the ever-changing viewpoint of these rapidly moving days.

You also ask, "How is it attained?" and the following suggestions from practice in housework, laundry, cooking and hygiene are offered:

The first step is to discriminate between essentials and nonessentials, and it is a fine art these days to correct our values.

Cooperation is a necessity. The children's help is their right and our privilege, for training prevents later handicaps. Early training to clean shoes before entering the house and putting things in their places, etc., are habits too good for anyone to miss.

### Housework

Housework is eased and shortened by the use of labor-saving devices which are being added to from time to time, as the fireless cooker, bread mixer, food chopper, vacuum cleaner (\$5 hand power, practical and satisfactory and an electric is rented for housecleaning time), dustless mop for the floors which are all hardwood, painted, or linoleum covered; dustless dusters and a variety of cleaning brushes. Bon Ami is used for windows and mirrors and kerosene for laundry trays, bath, sink, lavatories, etc. Have a high stool to sit on for some of the stand-up work.

Newspapers would require a chapter to enumerate their strength-saving daily uses. Spread on work table, etc., saving litter and soil, and used dry or damp they quickly prepare the dishes for washing. But my greatest labor-saving device is a pencil and paper.

"Knowing what to do next" sounds the keynote to success. A schedule for the day's plans, shopping list, menus, packing list for traveling, camping outfits, etc. Some of these are started long ahead, growing as items come to mind. Confusion is avoided, inconveniences minimized, and the delight of checking off as keen as childhood joys.

Summer days find many things about the house that may be set away to advantage, giving a cooler appearance and lessening cleaning and dusting.

### Laundry

Laundry economy of strength is achieved largely by wearing clothing suitable for occasions, work clothes for work and the dainty apparel for leisure. White goods put on in cold suds (borax added) and brought slowly to boiling are nearly washed. Naptha soap rubbed on soiled parts of colored goods soaked 15 or 20 minutes practically wash themselves.

Ironing is restricted to just the "fancy articles," for more and more I am deciding this and that is better for having the sunshine folded into it from the clothesline. They make a neat appearance, too, having been hung evenly. The change from ironing when the baking is going on to the comfort of an electric iron is true economy. I should certainly try a self-heating iron if we did not have electricity.

### Cooking

Cooking is a field that affords opportunity for saving strength, at the same time gaining increased strength for the entire family, for the simpler methods of preparing food are invariably the more wholesome. The superiority of homemade bread repays the labor, but in the rush of deciduous fruit harvest a baking or two is skipped and we enjoy the crisp little "loaves" of shredded wheat. Purchased by the case they are in daily use. A hearty and enjoyable meal is English plum duff, which is a boiled, plain, light dumpling with raisins added and served with butter or lemon sauce. Without the raisins it may be served with gravy, fruit sauce or jam. This is easily prepared and a change from the meat and vegetable dinner.

A boiled or baked main dish of a combination of vegetables and rice with a little cooking oil blends the flavors into a savory result and much easier than separately cooking ingredients. Our ranch provides the full California list of delicious fruit used daily. Simply prepared custards, pudding of well cooked cereals with raisins, brown bread and steamed or baked breads with raisins, dates, etc., are preferred to pastries, rich cakes, fried crullers, etc., for home desserts and the lunch boxes.

### Hygiene

Hygiene relates to the saving of strength by preventive measures. Keeping the family well is preferred to nursing them back to health, and the responsibility of either rests with the house mother. Proper selection and preparation of food, the liberal use of fresh air and water and the right mental attitude are investments to compare well in loyalty to purchase of Liberty bonds.

Enjoy the stimulus of growing a new fruit, flower, or vegetable in the garden, the inspiration of good books and magazines and a fresh outside interest by helping someone less favored. If your "neighbor" does not need, a public institution such as the county hospital or children's training school offers opportunity. The postal zone of three pounds for seven cents for a gift of fruit or flowers is a privilege. The refreshment and uplift from music in the home should not be neglected and need not be denied when a "record" places the artistic ability at our pleasure. There is rest in the change to a piece of knitting for the Navy League or stitches for the Red Cross. Lighten the burden before the last straw—does this mean to sell the second cow or decrease the flock of poultry? At night when we pray let us leave our cares, so that sleep may bring its intended refreshment. The wise man of old taught us: "As a man thinketh in his heart, so is he."

Vacation is an important factor, the happiest being in inverse ratio to their cost. A roll of canvas on the running-board of a Ford is the open sesame to indescribable delights in mountains or by the sea. We do not shrink from spending and being spent for a true value—for we die into life.

Let us remember we are not facing increased burdens alone, but increased and undreamed of opportunities and privileges. Realizing this, may we welcome every opportunity to "save our strength" so that we women shall be prepared not to do our bit, but our best.

### SAVING STRENGTH

Written for California Cultivator  
By Mrs. A. C. Pickett, Riverside

NOTHING is more necessary to the making of an ideal home than a happy, clear-headed woman. Therefore anything to make her such is important. A tired, cross mother is more than apt to have a tired, cross family. The remark is often heard, "I know I need a rest during the day, but I am too busy to take it."

In my own experience I have found that the more I have to do the more I need this rest. For years I have been as busy as a woman well could be, but I have proven that my rest and short nap some time during the day pays. Much more can be accom-

## The Cultivator Patterns

8254—Children's Dress. Cut in sizes 4, 6, 8 and 10 years. The dress is cut in one piece and closes at the back.

7718—Ladies' Waist. Cut in sizes 36 to 44 inches bust measure. Any of the pretty silk materials can be used for this waist.

7748—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. One or two materials can be used for this waist.

8238—Ladies' Apron. Cut in sizes 36 to 44 inches bust measure. The apron has raglan sleeves in long or short length.

8253—Ladies' Combination. Cut in sizes 36 to 44 inches bust measure. Camisole or corset cover and drawers may be used.

7624—Ladies' Skirt. Cut in sizes 22 to 34 inches waist measure. The skirt is cut in three gores and closes at the center of the front.

7345—Boys' Dress. Cut in sizes 1, 2 and 3 years. The dress is made in sacque style and has front closing.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

Pattern Department  
**California Cultivator**  
Los Angeles

plished and a happier household results. A comfortable position, comfortable and loose clothing, no shoes, out of hearing of the telephone, if possible, and a family understanding that "mother is resting" all help to obtain the relaxation and repose desired.

If there is a baby let its nap time be the mother's rest time. "Oh, but there are so many things to do while baby sleeps!" Yes, but the most profitable thing to do then is to rest.

My mother was the most uniformly cheerful woman I ever knew. She was the soul of hospitality and did much for those "without her gates." Her daily home tasks were not easy, nor was she very strong, but she made a study of her housekeeping, working intelligently, making her brain save both money and strength. She never stood when she could sit; she had a regular time for rest every day and if weary before a task was completed she would stop, lie flat down for a few minutes' rest, then resume the interrupted work. She was always the best of company for her family, making quite a game of the work allotted to the children. Her hearty laugh rang through the house, infecting the whole family, even the neighbors.

She appeared to enjoy her daily work, even that part which we are prone to name "drudgery." She claimed that as much outdoor work as possible had contributed to her good health. Every simple pleasure was magnified and every unpleasantness minimized.

"Efficiency is doing things the best, easiest and quickest way," regardless of Mrs. Grundy. This Mrs. Grundy interferes terribly with our conservation of strength. What will "they" say or think if our housekeeping is that awful thing, "slack"? Or if more than half of the washings are never ironed, if rose leaves strew the porches, if the children's clothing is very simple, if the meals are also very simple, etc. The old adage, "Whatever is worth doing is worth doing well," is sometimes dangerous advice to a housekeeper whose strength and time are limited. It is wiser not to do everything the best we know how. Let it be the best we can do under the circumstances. It is well for some to learn the "art of slighting."

Anything that helps to make and keep a house a home is not drudgery. Let us cut that word out of our thought, and let us make a courageous effort to eliminate from our program self pity, worry and hurry, those enemies to health, strength and happiness.

#### SOME WAYS TO SAVE STRENGTH

Written for California Cultivator  
By G. M. S., El Cajon

**O**NE of the ways I save my strength is in the manner of hanging my washing on the line to save a great deal of ironing.

I hang all skirts by the belt, doubled and perfectly straight; all shirts are hung by the shoulders, as well as shirtwaists. Everything, in fact, is hung as straight as it is possible, and then when taken in I am very careful not to wrinkle, but as far as possible fold everything as it goes into the basket. I never iron stockings, as I have seen so many frail women do, but fold flat and press into shape with my hands. Towels and everyday napkins are pressed with the hands in the same way. In fact, my everyday napkins are made of cotton crepe with a narrow fringe, and one set of them with lunch cloth, given me by a friend, has little designs in cross-stitch and is very much admired whenever I use them for company, as I frequently do.

Then another thing I do saves innumerable motions. I have a smooth board, which could be painted, only mine isn't at present, about 12 inches wide and two feet long; in fact, I have three of them and have driven in just far enough to hold firmly upright, some long slim nails, about three inches, I think. These I have driven three inches apart across the width and an inch and a half apart the other way. In these spaces I drain all the plates, saucers, platters and sauce dishes out of the hot rinse water. This saves not only strength but wear on dish towels, also the washing of the towels so often. By the time I have cutlery wiped and

other things cleared away the dishes are dry and I can put them in their proper places. If I am very busy and they are not quite dry I leave them till I set the table for the next meal. In case there are any flies around I throw a piece of white netting I have for the purpose over them. You will really be surprised to find how much time as well as strength is saved by these two methods.

#### SAVING STRENGTH

Written for California Cultivator  
By R. M.

**A**FTER the boy came mother's strength had to be saved in every way, and one she found most helpful was this: While nursing the baby rest his head on a pillow arranged in the chair beside you instead of holding his head on your arm. The difference is wonderful, and he is exactly as comfortable.

Another help is to always sit whenever possible. My kitchen stool is a great saver of tired feet.

This one "daddy" suggested: Wash the dishes but once each day instead of the usual three times. This would not be possible in a large family, and it goes quite contrary to my New England training, but it does save time and strength. And then sit while you are doing it even this once. And this last is even more contrary to all hard and fast laws of good housekeeping, but much help: I never wipe the china at all; simply stack in a wire drainer and scald, letting the sun do the rest. Then carry the drainer into the dining room just before the next meal and set the table from it, thus saving the putting away and getting out of the dishes—quite an item if one stops to think.

Some of these I don't do when there is company. I usually let them help enough so it is not necessary anyway, but in case they should get too wise I will only sign myself R. M.

#### CALLING THE CHILDREN

Written for California Cultivator  
By Mrs. E. M. Bradley, Hemet.

**M**Y pet economy is not one of dollars and cents, but a saving of steps and energy. In the country, where the children are free to wander over a good deal of space, I found I used many steps and wasted breath and voice when I wanted one or all of them. Sometimes in the midst of a noisy outdoor game I called many times before any of them heard me. Now I have a shrill tin whistle fastened to my dress, and each child has a signal. A series of short blasts means all, one blast is for the oldest, two for the second, and so on. I can summon them from the door, and the whistle never fails to attract their attention.

#### A FAST IS GOOD MEDICINE

Written for California Cultivator  
By Dora L. Mason

My greatest strength and labor-saver has been the conviction that to tempt a jaded appetite is worse than foolish; it is positively wrong. The ordinary person in ordinary health should do justice to an ordinary meal. Freak cravings and expensive tastes are taboo in my household. Highly complex concoctions and elaborately embellished desserts should never intrude upon the busy woman's time. The gospel of the dining room—a fast is as good as a physic. If appetite lags for a day or for a meal, why omit the next one, live on drafts of cool water and go on your way rejoicing.

#### SALAD DRESSINGS

Here is a good salad dressing that keeps: Take a half dozen eggs, beat well and add a half cup of mild vinegar, stirring it in gradually and put over hot water to cook. When smooth and thick the mixture will look like mayonnaise. If beaten with an egg whisk while cooking, the dressing is smoother. Put into a fruit jar and set in a cool place. When needed take out two or three tablespoons, add sugar, salt, red pepper, paprika, mustard and cream to thin. If making a fruit salad, omit the mustard and pepper. This is so easy to make and such a comfort to have that every farmer's wife should keep a jar on

Put a "two-C"  
in your pocket.

It fits.

## The 2C KODAK Jr.

For pictures of the somewhat elongated post-card shape, but just a trifle smaller,—2 7/8 x 4 7/8 inches. And this elongated shape in the picture makes possible a slim, thin camera, that fits the pocket.

The 2C Autographic Kodak Junior has a capacity of ten exposures without reloading, it has the Kodak Ball Bearing shutter with cable release, working at speeds of 1/25, 1/50 and 1/100 of a second and of course the usual "bulb" and time actions. The camera has brilliant reversible finder, two tripod sockets, black leather bellows, is covered with fine grain leather, is well made and beautifully finished. It is autographic, of course, and is extremely simple to use.

Furnished with a choice of lens equipment as listed below:

No. 2C Autographic Kodak Jr., meniscus achromatic lens,	\$12.00
Ditto, with Rapid Rectilinear lens,	14.00
Ditto, with Kodak Anastigmat lens, f. 7.7,	19.00

All Dealers.

EASTMAN KODAK COMPANY,

473 STATE STREET, ROCHESTER, N. Y., The Kodak City.

## CONVENIENCE

All the convenience of gas. No waiting for the fire to burn up. Meals in a jiffy, and a cool kitchen all the time.

Bakes, broils, roasts, toasts. Better cooking because of the steady, evenly-distributed heat. More convenient than a wood or coal stove for all the year 'round cooking—and more economical.

The long blue chimneys prevent all smoke and smell.

In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

## NEW PERFECTION OIL COOK-STOVE

STANDARD OIL COMPANY  
(California)

hand.

For potato salad: Melt one tablespoon butter in an enameled saucepan and beat in one egg; mix one tablespoon sugar, one of flour, one teaspoon salt, one of pepper and one of ground mustard and add to the egg mixture; fill a pint cup half full of vinegar and fill with boiling water; after stirring the first mixture smooth, add the vinegar and water and heat, stirring constantly, until it thickens; when ready to use, thin with cream to taste. It will keep some time, and is excellent with cold boiled potatoes sliced thin or chopped, with raw onion and boiled eggs.

For lettuce or cabbage, shredded or chopped: Fill a cup half full of sugar

and cover with vinegar; stir until the vinegar takes up all the sugar it will hold (about half), then fill the cup with sweet cream, stir and use immediately.

For beets: In a pint enameled cup, heat one-half pint vinegar with one tablespoon of butter, one of sugar, one teaspoon of salt and one of pepper; stir until boiling hot and well mixed; if too sharp, reduce with hot water; use immediately.

#### FRENCH FRIED ONIONS

Peel onions, cut in one-fourth inch slices, and separate into rings. Dip in milk, drain and dip in flour. Fry in deep fat and sprinkle with salt. These are fine with beefsteak.

#### CUTTING BIAS STRIPS

Instead of laboriously cutting eight or ten bias strips and then sewing them together, try this method, says Beryl Dickson of the Colorado Agricultural College:

Get the large piece on the bias from selvage to selvage. Then simply mark the strips off with ruler and pencil or chalk. Sew selvages together, letting top of piece on one selvage come even with the first pencilled line on the other selvage. Cut on the continuous line thus formed. The result is one long, bias strip with joinings already made.

Many people do not know of the prepared bias tapes with turned edges that may be bought at almost any dry goods store. The tapes come in various widths, ranging from one-quarter inch to an inch or more. They may be had in lawn or cambric and in solid color or striped gingham and percales. They are much truer than those made at home and make neat finishes on wash garments.

#### CORN IN BREAD

##### Wheat and Corn Bread

Enough for four loaves—Two and a quarter pounds or two and a quarter scant quarts sifted bread flour, three-quarters of pound or two and two-thirds cups corn meal, two cakes compressed yeast, three level tablespoons sugar, one and one-half level tablespoons salt, about one quart liquid (water, milk or equal parts milk and water), three level tablespoons shortening if desired.

If milk is used it should be scalded and then cooled until lukewarm. Less yeast may be used, but more time for rising will then be required.

Make a sponge with two pounds of white flour, the yeast, salt, sugar and the lukewarm liquid. Cover and set in a moderately warm place to rise, where it will be free from drafts and where the temperature will be between 80 degrees and 88 degrees Fahrenheit. When the sponge has become very light, which should occur within two hours, beat it up thoroughly, add the softened shortening, if this is to be used, and gradually work in the remainder of the wheat flour which has been sifted with the corn meal. Knead the mixture until a smooth and elastic dough has been formed which is fairly soft, but not sticky. If the dough is too stiff or too soft, add a little more water or flour as required, kneading well after each addition. Cover and set back to rise again until double in volume, which will require from one to two hours. Knead lightly, divide into three or four approximately equal portions, reserving a small ball of dough for an "indicator." Place this ball of dough in a small jelly glass having straight sides, which has been slightly warmed. Note the volume of dough in the tumbler and mark the glass at twice this volume.

Mold the loaves and place in slightly warmed and greased pans. Place these, together with the glass containing the "indicator," in the same warm place and let rise until the "indicator" shows that it has just doubled in volume. Then place the loaves in the oven, which should be at a good steady heat (400 degrees to 425 degrees Fahrenheit), and bake 45 to 50 minutes.

##### Wheat and Corn Bread No. 2

Same proportions as for No. 1 except the liquid. The corn meal in this method is cooked.

Put two and two-thirds cups (three-quarters pound) of corn meal into double boiler. Add to the meal three and one-half cups of cold water; mix thoroughly and bring to boiling point, stirring frequently. Allow meal to steam at least ten minutes, then cool until lukewarm. To this scalded and cooled meal add salt, sugar, one cup of flour and the yeast rubbed smooth and mixed with two cups of lukewarm water. Mix thoroughly, cover and set in moderately warm place to rise as directed in method No. 1. When this batter (or sponge) has become very light, which will require about two hours, beat thoroughly, add softened shortening, if it is to be used, and the remainder of the white flour (two pounds or quarts). Knead thoroughly until it is smooth and elastic. Should the dough be either too stiff or too soft add water or flour, a little at a

time, working it in thoroughly, until the dough is of the proper consistency. Cover and set back in its warm place to rise until double in bulk. Then mold into loaves and finish as directed under method No. 1.

Health and happiness are essential to contented living and to be contented and happy should be more desired than to acquire success and wealth.

## The Iceless Cooler

(Stephenson Patent)  
NO ICE USED

Requires no ice and will keep your butter, meat and vegetables COOL AND SWEET. Has ample room for all requirements of a large family. (Special sizes made to order). Write for particulars and prices.

## Save 1-2 on Fuel

**CHEAPEST HEAT YOU CAN BUY**  
The Stewert Oil Burner burns distillate costing only 6 1/2 cents per gallon in cook stoves, heaters, furnaces, pasteurizers, boilers, etc. Absolutely safe, odorless, very convenient and low priced. **MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS.** Install it yourself. Write for circular and prices on different sizes, address Stewert Oil Burner Co., 710 North Main St., Los Angeles.

## ANNUAL JULY Blanket Sale

For lack of space, detailed prices cannot be quoted upon odds and ends, sample, soiled and single blankets; the following are the reductions on our regular lines. In the lot were a number of blankets with slight imperfections, which we retained, where such imperfections did not interfere with warmth and service.

### White, Plaid and Colored Blankets

\$3.75	\$3.10	\$4.50	\$3.65
\$6.50	\$4.90	\$7.50	\$5.90

When in Los Angeles for the Week-end Trip.

## Hot Weather Coming — Also Ants

# KELLOGG'S ANT PASTE

### MAKES ANTS DISAPPEAR

The season is approaching when ant troubles are the worst. Don't suffer longer when a 25c bottle of Kellogg's Ant Paste will drive every ant out of your place in 24 hours. Insist on the original—Kellogg's—with the rattle-cap package.

25¢ AT ALL DRUGGISTS

## THE RETREAT OF THE ANTS

## Get the Light and Power You Need

from your own generating plant

The UNI-ELECTRIC lighting system will put electric light in every room in your house, will run your sewing machine, electric iron, vacuum cleaner, churn, washing machine, etc.

It Is Economical and Efficient—Always Ready

Operates with a silent gasoline engine of high speed, generator and automatic governor. Uses standard globes and fixtures. Is easy to install.

Can be used for one or more houses, barns, sheds, work shop and any place where you need light and power.

HAY

Under date of June 30 Scott, Magner  
& Miller say:

Receipts past week 1997 tons, last week  
1511 tons. Entire receipts have been of  
new crop, old hay having been absolutely  
cleaned up. Most of the hay which has  
arrived to date has been from small pur-  
chases made by dealers who were com-  
pelled to go into the country and start  
some of the new hay moving on account  
of the scarcity and high prices of the old  
crop. Farmers have been holding at  
prices far in excess of normal. Alfalfa  
shows practically no change with re-  
ceipts small. Straw is being offered from  
many outside sections but demand is  
light. Prices quoted below are on new  
hay only.

We quote today wholesale prices in  
carload lots as appear from dealers'  
transfers upon the market. For prices  
to consumers, charges of cartage, com-  
mission and handling expenses must be  
added.

We quote today wholesale prices in

ABOUT CANNING AND DRYING OF  
FRUITS, VEGETABLES AND  
MEATS

A survey of the index on pages 726,  
727 of last week's issue will show that  
during the past six months the Cul-  
tivator has given a valuable fund of  
information as to canning, preserving  
and drying of almost everything  
which can be canned or dried. In  
fact, the list shows many things  
which may be cured and canned  
fore considered.

We repeat here some of the titles  
appearing in the index: Canning  
Meats, page 499; Home Canning, 500;  
Canning, 524; Home Canned Vegeta-  
bles, 524; Corn, Beans and Tomatoes,  
525; Canning in Tin, 525; Canning  
Vegetables Pays, 525; Preservation of  
Vegetables Without Canning, 534;  
Canning, Beans, Cucumbers and Sal-  
mon, 548; Home Canning, 605; The  
Home Evaporator, 588; Canning  
Fruits Without Sugar, 639; Drying  
Winter Vegetables, 638; Stop Food  
Waste by Drying; 684; Fruit Juices  
for Jelly Making Kept Without Sugar,  
685; Hints on Canning, 700; Sulphur-  
ing Fruit, 689; Using Old Cans, 683,  
713.

YOUR HOME ELECTRIC PLANT

Because you live away from a power  
line there is no reason why you should  
not have just as good a light in your  
home as your city friend has in his. An  
electric plant of your own may be placed  
on your premises at any convenient lo-  
cation and you can generate electricity  
for lighting every room in your house,  
for running your vacuum cleaner, your  
sewing machine and any other machine  
that may be desired. What more could  
one ask? It is the acme of perfection,  
the ideal way of having those things  
which make for a more comfortable  
home and more convenience in the dis-  
tribution of power. You can stretch the  
line anywhere instead of taking a heavy  
engine about. It means the elimination  
of lost motion.

This system is known as the uni-lec-  
tric system. It uses no batteries and has  
no complicated switchboard. There are  
no belts or pulleys and no chains or  
sprockets. It delivers a standard cur-  
rent of 110 volts, the current that is  
most commonly used in all city lighting.  
Every electrical fixture and appliance  
that you buy will be fitted for 110 volts,  
unless otherwise ordered. The system  
uses standard electric lamp bulbs and  
will generate enough electricity right  
along to light your entire house and at  
the same time run your machines and  
cook your dinner. There is ample pow-  
er for every purpose at all times. If  
you are interested in the machine you  
can write to Mr. Karl Hedberg, 104-6  
Clay Street, San Francisco. Full infor-  
mation will be sent and you can consider  
whether or not it meets with your re-  
quirements. It should be considered  
worth investigating.

In response to the increasing demand  
for farm machinery and the possible  
shortage of some lines, Dixon & Gris-  
wold of 146-48 N. Los Angeles Street,  
Los Angeles, have taken over an addi-  
tional warehouse with a floor space of  
50,000 square feet. This extra room will  
enable them to take care of their big  
shipments constantly arriving and insure  
the farmers immediate delivery of all  
classes of farm machinery upon receipt  
of order.

WEATHER CONDITIONS

## The New Oliver Nine

Was \$100  
Now \$49

## A TYPEWRITER REVOLUTION

New Machines for Half the Former Price

At the very height of its success, The Oliver Typewriter Company again upsets the typewriter industry. Just as it did in 1896, when it introduced visible writing and forced all others to follow. Now this powerful Company—world wide in influence—calls a halt to old expensive ways of selling typewriters. It frees buyers of a wasteful burden.

A company strong enough, large enough and brave enough to do a big, startling thing like this, deserves a hearing.

The full facts are set forth in our amazing exposure, entitled "The High Cost of Typewriters — The Reason and The Remedy." One copy will be mailed to you if you send us the coupon below.

### HOW WE DO IT

Henceforth The Oliver Typewriter Company will maintain no expensive sales force of 15,000 salesmen and agents. Henceforth it will pay no high rents in 50 cities. There will be no idle stocks.

You, Mr. User, will deal direct now with the actual manufacturer. No middlemen—no useless tolls. We end the waste and give you the savings. You get the \$51 by

being your own salesman. And we gain economies for ourselves, too. So it isn't philanthropy. Just the new, efficient way of doing business to meet present-day economic changes.

Note this fact carefully. We offer the identical Oliver Nine—the latest model—brand new, for \$49, the exact one which was \$100 until March 1st.

### THE LATEST MODEL

Do not confuse this offer of The Oliver Typewriter Company itself of a brand new latest model 9 with offers of second hand or rebuilt machines.

This is the first time in history that a new, standard \$100 typewriter has been offered for \$49. We do not offer a substitute model, cheaper, different or rebuilt.

Read all the secret facts in our document, entitled "The High Cost of Typewriters—The Reason and The Remedy." The coupon below mailed today will bring you one copy.

## SAVE \$51

This Oliver Nine is a twenty-year development. It is the finest, costliest, most successful typewriter we ever built. It is yours for 10 cents per day in monthly payments of \$3.00. Everyone can own a typewriter now. Will any sane person ever again pay \$100 for a standard typewriter when the Standard Visible Oliver Nine sells for \$49?

Send today for your copy of our book and further details. You'll be surprised.

MAIL TODAY

## FREE TRIAL

No Money Down—No C. O. D.  
After you read our book you may ask for an Oliver for five days free trial. Be your own salesman. Save yourself \$51. You decide in the privacy of your own office or home, as you use the Oliver. Then if you want to own an Oliver you may pay at the rate of 10 cents per day.  
Mail the coupon now for "The High Cost of Typewriters—The Reason and The Remedy." It rips off the mask. Cut the coupon out now.

# Every Bean Farmer is Interested in this

There was a time when the bean growers of California tramped out their valuable bean crop on a threshing floor. Through years of patient toiling and the application of scientific principles William Hamilton, mechanic and inventor, patented and manufactured the Ventura Bean Thresher. The production of this machine has been to the bean industry what the reaper was to wheat. For twenty-one years our threshers have given universally satisfactory service. Beginning with one machine we now offer six sizes.

## The Ventura Bean Thresher Junior No. 2

Is now offered for the farmer who desires to do his own work in his own time. The Junior No. 2 also is large enough for a neighborhood thresher to supply the needs of several farmers with relatively small bean acreage who may be unable to wait for service from the big machines. The Junior No. 2 is the best machine in the various types now on the market. It has its own power (also without power), is substantially built, and has all the successful construction that has made our larger machines supreme in the bean threshing line. The price is within the reach of all bean farmers. It can be operated with a minimum of ten men and possessing a thresher like this you can thresh when the best opportunity is offered. Capacity 150 to 300 sacks per day. You cannot afford to take chances on bean crop losses when prices are so good when you can save your crop with a machine like this. There is a greatly increased bean acreage this year and a shortage of materials. Orders will be filled in the order received. Place your order early or you will be disappointed.

Ask your nearest dealer or write to us about it now. Free catalogue on request. We manufacture a full line of bean and beet tools.

## Spraying Citrus Orchards With Oil

Written for California Cultivator Readers by Ralph de Ong. Hints of Great Value Which May Prevent Much Injury and Which Should Prove Effective

**T**HE SPRAYING of citrus trees for the control of scale insects is sometimes advisable for young trees, very small plantings or when cyanide is unobtainable for fumigation purposes. Under normal conditions, however, it should not be substituted for fumigation, as it is very difficult to make an application by spraying that will be comparable to the former method. Besides much damage has resulted to the tree and fruit from the use of petroleum oils, especially the heavier distillates.

An investigation of the use of oil on citrus trees has been in progress for two years by Prof. Geo. P. Gray and the author, of the California experiment station, some of the results of which are given below. There are two groups of petroleum oils which are used on citrus trees:

Distillates—light and heavy oils unrefined, which are secured by a process of distillation from crude oil.

Kerosene—A very light, more or less refined oil, also obtained by distillation from crude oil.

These are classified according to specific gravity, given in terms of the Baume scale and the flash point of

the oil. The latter is the degree of temperature at which enough inflammable vapor is given off to burn with a slight explosive effect. Distillate oil is a term generally applied to unrefined, medium heavy oils, with a Baume test of 20 degrees to 36 degrees and of a yellowish or reddish color. The term "distillate" may be properly applied to any product derived from the distillation of crude oil but the commercial use of the term refers to oils of the above type. The kerosene type of oil has usually been refined to a certain extent by the use of sulphuric acid. It is of a whitish color, flashing at 98 degrees to 104 degrees Fahrenheit with a Baume test of 38 degrees to 42 degrees.

The above oils are commonly applied in the form of emulsions, a combination of water, soap and oil, which, when agitated violently, causes the oil to break up into very small globules which remain suspended in the water for a varying length of time, allowing the oil to be applied at any dilution desired, thus reducing to a minimum the possibility of danger to the plant. A commercial preparation known as "miscible oil" furnishes a convenient method of preparing oil

sprays, being a very concentrated solution of soap and oil which simply requires the addition of water to prepare for use. The principal objection to these is that the buyer does not know the character of the oil or soap used and in the past there has been considerable defoliation and spotting of fruit from the use of miscible oils, (miscible oils are commonly made with cresol soap), as well as home made emulsions. Care must be exercised, not only in the choice of an oil to be used on any kind of foliage, but also the amount of soap. Usually a fish oil or laundry soap is safer to foliage than an emulsion made by the use of cresol soap.

Oils vary in their action on insects just as on plants, the heavier ones, such as 16 degrees to 20 degrees, Baume, will usually control scale insects at percentages of one and two per cent, but even at this strength the leaves and fruit are frequently spotted or will turn yellow, with a tendency to stunt the entire tree, new growth sometimes being checked.

The lighter grades of distillates, 28 degrees to 34 degrees Baume, commonly called "stove distillates," are used at percentages of three to five

per cent. In cool, moist climates these are often free from danger, especially the lighter oils, but in hot dry weather, partial or complete defoliation of the tree may follow their use, accompanied with spotting of the fruit. The heavier types, 28 degrees to 32 degrees Baume, will sometimes stunt the bearing wood on the surface of the tree, with a resulting growth of water sprouts through the center of the tree.

Kerosene oils are the only ones used without injury to the tree or fruit in a large series of experiments at Riverside and Berkeley. The oils tested from 39 degrees to 42 degrees Baume, with a flash test of 99 degrees to 104 degrees Fahrenheit. The kerosene emulsions were of a 20 per cent strength, that is 20 gallons of oil in 100 gallons of spray; which is at least twice as strong as necessary for the control of scale, the usual commercial practice being seven and one-half to 10 per cent strengths. These sprays were applied during a wide range of climatic and soil conditions, without any injury to the tree, unless the oil reached the roots. In the use of any kind of oil on citrus trees it is always

Continued on Page 28.

## Efficiency of the Tractor

A Few Suggestions as to Value of the Horse which Eats no Oats When Not in Service.  
Use of This Efficient Servant Will Increase as Farmers Understand Its Value

**T**O FORSEE is to rule" a philosopher once said. And certainly the truth of his words will be tested in the coming months, when America's ability to foresee the needs of the country and meet these needs efficiently, will mean so much to America in successfully waging the war with Germany.

We have all read President Wilson's utterances regarding the important place the farmer must occupy in the great world war. Feeding a world at war is a serious business, because it means farm production of food stuffs must be increased beyond a point never even dreamed of in the past. The ways and means for doing this will mark a new epoch in farming, as distinct from present farming methods as the epoch brought about by the reaper and other modern farm implements.

The urgency of the present food situation assures us that the tractor problem on small farms will be solved quickly; that developments in tractor farming will be so rapid as to astound the world; that types of tractors will soon be in use which will not only prove profitable on small farms, but almost indispensable even to small renters.

If one has only a small farm he may

A Good Straight Furrow

In straight field work the tractor is becoming almost indispensable. It is also being adapted to orchard and other more complicated situations. The tractor will be used more and more.

not find a tractor a profitable investment. It's probably because small acreage will not justify maintaining both horses and a tractor. The amount of money tied up would be too large and the up-keep too heavy. Therefore, a tractor to be profitable must do a large enough percentage of the things which horses now do, so that one can eliminate at least 75 per cent of horses.

What would it mean if one could get a tractor which would not only do 75 per cent but 100 per cent of the

things that horses now do, besides doing many belt-work jobs which horses can't do? It would simply mean that every farmer would find such a tractor indispensable. One would be able to plow deeper and earlier, thus preparing a seed bed of a character and at a time when it would absorb the rainy season moisture, and store it for bigger, faster growth, in crops and as a safe-guard against droughts.

One would disk, harrow, drill and do the harvesting quicker and easier than ever before, even with several

horses and a lot of hired help. It would be possible to cultivate seven times instead of four times, and a big corn crop would be assured regardless of the weather.

In short we would do our share to meet the world need for more food-stuffs. Besides all would work easier and quicker; have more leisure time; more pleasures; the chores would be done earlier; in fact, much of the drudgery of farm work would be eliminated and there would be less trouble keeping boys on the farm.

Would a tractor like this, of moderate price, built so one man could operate it easier than a team, pay on a small farm? A tractor that would eat only when at work?

Of course it would pay! And when such a tractor is offered for sale by a reliable maker the demand for it will be so great that it will require tractor factories larger than any automobile factories ever built to supply the demand for it.

Now that America "foresees" the need, let her engineers and manufacturers produce the type of tractor which will make possible universal use of the tractor on the farms of America. If they are able to do it—and it is confidently believed that they will do it—then America will not have entered the war in vain, and democracy will "rule" the world.

### SPRAY WITH OIL

Continued from page 27

best to prevent the spray from coming in contact with the root system. If it should run down the trunk in any quantity and soak the soil around the crown, it is well to draw the saturated soil away with a hoe.

The formula for kerosene emulsion to be used on citrus trees is:  $7\frac{1}{2}$ -10 gallons kerosene,  $3\frac{3}{4}$ -5 pounds soap, to make 100 gallons of spray.

The smaller amount of oil will be effective against newly hatched scale. As they grow older the larger amount of oil should be used.

The quantity of soap will also vary with the hardness of the water, soft water requiring considerably less than hard water. If the latter is used one or two pounds of caustic soda or lye should be used to soften the water. To prepare the emulsion dissolve the soap in hot water, and while still warm add the kerosene and an equal amount of water. Agitate the mixture violently or pump it onto itself until a milk white liquid results, then dilute for spraying.

Work is still being continued in endeavoring to find a safe oil or to determine the element in the oil which is dangerous to foliage and, if possible, to eliminate it. It has been suggested by Prof. Gray that the treatment of petroleum oil with sulphuric acid might remove the dangerous element, this treatment being the chief refining process for kerosene, which proved to be by far the safest oil of any used. Should this process prove successful in removing the dangerous element, it would be a simple matter for any refinery to prepare oil for

spray purposes which would be safe for foliage use.

The time of application is another important one in scale control, for the adult female scale is very much more difficult to control with insecticides than the newly hatched scale. Work should be postponed until all or the greater part of the hatch of young scale is complete for the season. In some of the citrus regions the black and citricola scale finish hatching the very last of July or the first part of August. In other regions the hatch may not be complete until September. The hatch of the red scale is distributed over so much longer period that it is difficult to set a date when the majority of the young scale will have emerged. But all spraying should be done after the young scale have appeared or at least a large part of them, for those which are unhatched at the time of the spray will probably emerge later. It is often necessary to make two applications of an oil spray, one about the close of the hatching season and another later in the fall, when a special effort can be made to reach those that escaped the first spray.

In all work great care should be taken to cover both sides of every leaf on the tree, which is of course very difficult to do on a citrus tree. The extreme care which is necessary to make a success in citrus spraying is the greatest hindrance to its value, for if two applications are necessary the expense will be about the same as for fumigation, while the latter is nearly always more efficient. But when cyanide is unobtainable, or for small trees, a carefully chosen oil can be substituted with at least no greater danger than is found in fumigation.

## No Alkali from Nitrate

By R. R. Snowden, Analytical Chemist

HERE is data which may interest you as scientific agricultural information, since they are accurate results of actual observation and experiment.

You may use them as you like.

No. 1 is the soil of a thrifty and profitable lemon grove in the Montrose section, upon which 800 pounds nitrate of soda per acre has been used per annum for the last eight years—(6400 pounds per acre total).

No. 2 is the soil of an apricot grove adjoining and of the same contour and character as the lemon grove, which has received no additions, either as fertilizers or irrigation water.

Tract No. 1, a lemon grove, showed no alkali carbonate; neither did the apricot grove, tract No. 2.

The analysis showed Tract No. 1 to contain 3720 pounds alkali bicarbonate as sodium bicarbonate in one acre three feet depth. Tract No. 2, the apricot, contained 2194 pounds, a difference of 1526 pounds.

Analysis showed no content whatever of alkali sulphate in either tract.

Of alkali chloride as sodium chloride it showed a content of 1380 pounds in tract No. 1, three feet depth, while the apricot grove, Tract No. 2, contained 703 pounds, a difference of 677 pounds.

It would appear that were the alkali bicarbonate in the lemon soil derived from the nitrate of soda the proportion of this to the chlorine would be larger in the lemon than in the apricot soil; but the reverse is the case.

The 2194 pounds of alkali bicarbonate and the 703 pounds alkali chloride in the apricot soil could only have come from soil decomposition; therefore, assuming like amounts from the same source in the lemon soil the excesses over these figures in the latter soil might well have come from the irrigation water, and not from the nitrate, as the above will show. The nitrate was always associated with sulphate of lime in superphosphate, which converted the whole of the soda into sulphate. There is now no sulphate, this having gone with the soda.

## Avocado Appreciation

NOTWITHSTANDING, appeal made by members of the California Avocado Association that the beastly (not slang) "alligator pear" be eliminated from market reports, both Los Angeles and San Francisco dailies continue use of the misnomer. "Why?" No one knows. Meantime avocado growers are hoping and talking a bit for a more enlightened policy.

Thomas H. Shedden, the Monrovia

avocado grower, president of the association, writes:

"When I read in the issue of the 2nd inst. a short, but excellent article entitled, 'No More Alligators,' in admiration of it I said, 'Multum in parvo,' and eventually filed the copy away with feelings of satisfaction towards the Cultivator, as I do each week.

"I have brought this copy out again by reason of having received a number of written, as well as oral commendations of that little article.

"The receipt of them prompts me

to mention this appreciation which is due you, and which comes to you in this roundabout way. One writer, an able man of the southland, gives high praise, but in entirely good spirit, calls attention to the extraneous word 'Growers' therein attached to the title of the organization which is simply, 'The California Avocado Association.' "These pioneers in the young industry which will soon mean much to California, are appreciative of every good word said of the avocado and of every man who 'Despises not the day of small things'; and as manhood's years ever remembers the kindly words and acts received in child life, so, as the avocado becomes truly great in California, and beloved by all, may those who have helped it be not forgotten."

OLIVE PRUNINGS FOR FERTILIZING

An exchange quoted in the Olive Journal tells of a use found by R. C. Merryman for the prunings from his olive trees, which had previously been burned to get them out of the way of cultivation. This account goes on to say:

One day while Mr. Merryman was inspecting his olive groves the idea dawned upon him that good material was being wasted when the olive tree prunings were burnt to clear the ground of their brush.

"What's the matter with cutting up those prunings in some sort of a chopper and strew the cuttings on the ground in the orchard and plow them under for fertilizer? This should add organic matter to the soil and keep the soil friable that it may conserve the maximum quantity of water when irrigated."

After this consultation with his manager orders were given to build a cutting machine of odds and ends in the waste pile of the blacksmith's quarters.

A six-horse-power engine was mounted on a light orchard truck, the pulley of which was belted to a large ordinary alfalfa cutter. When the olive prunings are fed over a short platform at the back of the rig the cuttings fall under the machine and are raked into a pile on one side.

This was another of Mr. Merryman's "waste-saving" ideas, which, after a year operating, he terms "a very splendid" investment.

A PERFECTLY GOOD PASS

We are all a little sensitive about having our name spelled correctly but when a name is taken from one's penmanship for that of an entirely different individual he has occasion to feel peeved. We have the following letter from Mr. E. T. Sederholm of Pomona:

"They tell a story about the president of the Erie railroad, who was a very bad writer, and who once upon a time wrote a letter in his own handwriting, declining the granting of a pass over his lines. For two long years the recipient of the letter used it for a pass, and it was good everywhere.

"I did not know my handwriting was as bad as that, yet so it would appear, seeing that you have made my name out to be G. T. Henderson, as a signer of the Pomona Smudgepot test report. It is 'E. T. Sederholm,' and I thought that this time I had better put it in type."

As bad as the break was Mr. Sederholm shows that he can still be good natured and we appreciate his correction.

OLIVE STANDARD

The California Olive Association has adopted the following standards for the coming season's olive pack:

Olives per lb.	Grade
120 to 135.....	Standard
105 to 120.....	Medium
90 to 105.....	Large
75 to 90.....	Extra Large
65 to 75.....	Mammoth
55 to 65.....	Colossal
45 to 55.....	Giant

PORTO RICO FRUIT

A new brand of fruits, advertised by its growers, soon will make its bow to the American public. The Porto Rico exchange has made definite arrangements for advertising the island fruit, beginning with the next citrus crop. A number of fruits will be advertised under the same general brand; grapefruit, oranges and pineapples. A standard quality will be set for fruit to be packed under the advertised brand. The advertising fund for the first year will be raised by an assessment of 10 cents a box on all fruit shipped by growers who have contracted to ship their fruit through the organization. This will provide an advertising appropriation of about \$25,000 the first year.

A most exhaustive study of "Certain Effects Under Irrigation of Copper Compounds Upon Crops" is shown in

University of California Publications in Agricultural Sciences, Vol. III, No. 12. The investigations were made by Prof. R. H. Forbes of the University of Arizona. The report has to do largely with copper in certain mining districts, or rather in irrigated districts

near them; also with experimental work done with various copper compounds, a general discussion as to accumulations of copper, possible effects upon health, effects on aerial vegetation, on root systems, pathological effects, etc. It is a strictly technical report with several plates.

State Horticultural Commissioner Law

By Horticultural Commissioner G. H. Hecke Before Commissioners' Convention at Modesto

THE ACT relating to the state commissioner of horticulture provides for a commissioner to be appointed by the governor, and defines his duties, which are, in brief, to promote and protect the plant industry of the state. He is charged with the enforcement of the horticultural statutes which are enacted for the purpose of preventing the introduction and spread

of injurious insect or animal pests, plant diseases and noxious weeds, and with the introduction and distribution of such parasitic and predaceous insects as are useful in reducing the cost of crop production. He must require reports from the county horticultural commissioners and must distribute to them, and to such other persons as he may deem proper, such printed information as he considers

# Fifty One Years

Back of the Moline Universal Tractor is one of America's oldest, strongest, most reliable farm implement makers, with over 51 years of successful manufacturing experience.

You can rest assured that a farm implement with the name **MOLINE PLOW CO.** on it will not disappoint you in field performance. The **MOLINE TWO-WHEEL UNIVERSAL TRACTOR** is no exception. It is proving itself to be the most popular and practical tractor ever put out because it fits more completely the needs of the great majority of farmers. Read below why you should choose it, whether your farm is large or small.

## MOLINE UNIVERSAL TRACTOR

- 1st.—It will do all farm work horses can do—from plowing to harvesting, even **CULTIVATING**—something no other tractor does successfully. Besides supplying power for belt work.
- 2nd.—It is a **REAL** one-man, all-purpose tractor. The operator rides the tool, not the tractor—rides where he can watch his work carefully.
- 3rd.—Easy to handle as a team. Turns short; backs up with implement attached; light in weight, inexpensive to operate and will not pack even plowed ground.
- 4th.—It is the **Original Two-Wheel Tractor**. Both wheels are drive wheels. All its weight is traction weight. Means greater traction and draw-bar pull. Eliminates almost a ton of dead weight.
- 5th.—The **MOLINE UNIVERSAL TRACTOR** is backed by a \$19,000,000 corporation. It is built in the largest tractor factory in the world with 25 factory branches to give you prompt efficient service.

Write today for **FREE CATALOG FOLDER** and see for yourself how the **MOLINE UNIVERSAL** will solve the power and help problem on your farm.

## MOLINE PLOW CO.

Dept. 49 MOLINE, ILL.

**THE MOLINE LINE**

**Includes:**

- Corn Planters, Cotton Planters, Cultivators, Corn Binders, Grain Drills, Harrows, Hay Loaders, Hay Rakes, Lime Spreaders, Manure Spreaders, Mowers, Plows, Scales, Seeders, Farm Trucks, Vehicles, Wagons; also

**Stephens Six Automobiles**

**Discing**

**Drilling**

**Cultivating**

**Harvesting**

adapted to the advancement of the horticultural industry of California. He is authorized to establish quarantines, with the approval of the governor, at or within the boundaries of the state for the protection of the horticultural industry against the introduction of pests. He is given exclusive authority to establish horticultural quarantines within the boundaries of the state, this provision abolishes the old system of quarantine by county ordinances.

In case of the discovery of any infectious plant diseases, insect, animal or weed pest within the state dangerous to the horticultural industry, or upon information that there is a probability of the introduction of such, he is authorized to investigate the same and to issue such regulations as may be necessary to circumscribe, exterminate, eradicate or control the same.

He must notify the quarantine guar-

dian or horticultural commissioner in the county where such pest or disease is discovered, as to the specific method of treatment in each case, and such recommendations must be made a part of the notice served by the county horticultural commissioner on the person owning or having charge of the infested or infected property.

The statute requires every nurseryman, person, firm or organization who deals in nursery stock, trees, plants, shrubs or vines for planting or propagating purposes within the state to register with the state horticultural commissioner and to pay a fee of one dollar for such registration for the period of one year. The state commissioner of horticulture must issue to each applicant a special license number, and all shipments by such licensee shall have this number affixed to each package of nursery stock, etc. Agents or salesmen acting for a

nursery or organization are required to use the license number signed to the nursery or organization by which they are employed. Any nurseryman or organization outside of the state, wishing to ship nursery stock, etc., into the state, must apply to the state commissioner of horticulture for a permit, filing with his application a statement of location of his place of business and an official certificate of inspection of his premises signed by his state inspector. These permits shall have a special number which shall be placed upon each package shipped into California. No charge shall be made for these permits. The state commissioner of horticulture may refuse such permit, if in his judgment to issue same would endanger the horticultural interests of the state.

Wilful refusal to comply with orders lawfully made under this act shall be deemed a misdemeanor and upon conviction a fine not to exceed five hundred dollars may be imposed.

## New Grading on Budded Walnuts

FROM the latest report of the California Walnut Growers Association we note the following as to "Budded Walnuts":

"The Association has always maintained a policy of giving its customers what they pay for and of keeping its gradings in line with the consumer requirements. Thus it was the first to make definite guarantees of size, cracking standards, price and weight shrinkage. We have always striven to make the Diamond Brand the best walnut on the market, believing that only by maintaining highest quality standards could our business be satisfactorily and profitably developed. When the California Budded Walnut was first placed on the market, among the chief points of appeal to the trade and the consumer were its large size and uniform appearance. The size feature was due primarily to the fact that Budded Walnuts are of comparatively recent development and when first marketed were all produced from young trees. As these trees became older and larger and bore more heavily, the size of the individual nut gradually decreased until during the last season or two quite a number of the oldest budded groves have reached the full bearing stage and the average size of the Budded Walnut has consequently become smaller. This situation has caused some complaint on the part of our trade. Thus in order to entirely satisfy our customers who use Budded Walnuts we have adopted a new sized grader for Budded Walnuts with openings one and nine-sixty-fourth inches square. This grader will therefore remove all of the smaller Budded Walnuts which will be placed in a separate grade and will change the guaranteed minimum size of the Fancy Budded nut from one and one-sixteenth inches in diameter to one and one-eighth inches in diameter. Thus the regular Diamond Brand Fancy Budded Walnut will hereafter be larger and more uniform in size than ever before and those jobbers now having signed contracts specifying the minimum size of the Fancy Budded at one and one-sixteenth are hereby authorized to change their contract, increasing the guaranteed minimum size to one and one-eighth inches. This higher grading while further limiting our supply of Budded will certainly put the Diamond Brand Budded Walnut in a class by itself and that class will be absolutely the finest walnut on the market. And notwithstanding this fancy grade it is not expected that the differential in price between the Fancy Budded and the Soft Shells will be increased.

### Standard Budded

The Budded Walnuts which pass through the larger openings of the new grader will not be marketed under the Diamond Brand but will be sold under the Golden State Brand. The grade will be known as Standard Budded whilst the Diamond Brand goods will be classed as Fancy Budded. Before packing, the Golden State Brand Standard Budded will be run over the regular No. 1 Soft Shell grader which will again remove the smaller nuts from the standard buds. The result will be a Budded Walnut of a uniform size, averaging a trifle smaller than the average delivery of No. 1 Soft Shells. We offer a limited supply of these Golden State Brand Standard Budded Walnuts at one cent a pound premium over the regular No. 1 Soft Shells. For eating quality

# PLANT Sudan Hay NOW and profit by nation's hay shortage!

"THE country will be long on Egyptian corn and Milo Maize, and short on hay." This is the report that has come in from all sections. Keen, wide-awake ranchers are going to profit by this national hay shortage. They are planting that marvelous grower that rivals Jack's famous beanstalk—Sudan Grass. It grows rapidly during the warm season—matures in 40 to 60 days—yields eight to ten tons per acre per season with irrigation. The following cuttings mature in 35 to 40 days:

Sudan hay is recommended by agricultural experiment stations the nation over. Attains a height of five to six feet in 40 days. It is sweet and nutritious and is liked by all classes of stock. Sudan hay outyields timothy, rye and barley hay by a fifty per cent margin. It is twice as rich in protein, fat and ash.

Sudan grows in any soil from sand to clay. Sudan hay will make money for you this season—the hay crop is scant and commands sky-high prices. Plant Sudan now and collect fat dividends later. Don't wait another day—send in your order at once and insure immediate delivery. Big free illustrated folder will be sent by return mail.

## SPECIAL JULY PRICES

36 cents per single pound, enough for 50x50 feet.

10 pound lots, 34 cents a pound, will plant half an acre (sown broadcast.)

25 pound lots, 32 cents a pound.

100 pound lots, 28 cents.

## ORDER BLANK

SOUTH MAIN STREET  
LOS ANGELES - CAL.

there will be nothing better in our line than these Standard Budded as they are of a size that will undoubtedly show a higher cracking standard than anything else in our pack, will have the usual sweet and excellent flavor of the Budded Walnut and we believe that after a year's trial they will be the most popular seller in our line. We would like every jobber who is handling our Fancy Budded to try from ten to twenty per cent as many Standard Budded as Fancy.

What is a Budded Walnut?

As the Budded Walnut has only been marketed commercially for a comparatively short time many of our customers are not thoroughly posted as to how this nut differs in method of production from the soft shell. Therefore a brief explanation here will no doubt prove of interest to many jobbers. It should first be understood that the Budded Walnut is a variety of nut and not a grade. Trees that produce Budded Walnuts produce no other grade and trees that produce soft shells do not produce any Budded. Perhaps the simplest way of explaining the difference between a soft shell walnut and a Budded is to compare the propagation method of these two varieties. The soft shell walnut is grown by planting a seed from a parent soft shell tree. This seed sprouts and becomes itself a bearing tree producing soft shell walnuts. Generally speaking it is ten years from

planting before the ordinary soft shell walnut comes into profitable bearing. The Budded Walnut is grown by planting in nursery rows the seed of a wild black walnut. These seeds come from just such black walnut trees as grow wild in most Eastern states. A year from planting the seed when the young black walnut tree is about three feet high the trunk is cut off about three inches from the ground, a slit made in the bark of the three inch stub, and a bud from a walnut tree perfected in California known as the Placentia-Perfection variety inserted in this slit. This Placentia-Perfection bud shortly sprouts and develops the trunk and branches of the Budded Walnut tree. The nut known commercially as the Budded Walnut is really a Placentia-Perfection walnut. It is commercially known as the Budded Walnut by reason of the process of budding the Placentia to the black walnut root. A year from the budding operation the young tree is ready to be removed from the nursery row and is planted in orchard form, trees about 50 feet apart. Thus we have a walnut tree with a wild black walnut root which is very hardy and vigorous, and the Placentia-Perfection top. The budded trees grow faster than the soft shells and reach the profitable bearing stage in about six years from planting in orchard form. The Budded Walnut is typically a trifle larger than the soft shell, more uniform in shape and appearance, has a thinner shell, a plumper and sweeter flavored meat, and a considerably greater percentage of meat to shell than the soft shell variety. Thus at the usual differential in price

between the soft shells and Buds a dollar will buy about the same weight of edible meats in Budded nuts as in soft shells. Approximately 75 per cent of plantings made in the last seven years are Budded.

Association Gains

The consumption of walnuts in the United States has been increasing greatly each year. A new record was set for the 12 months ending June 1st, 1917, in which period considerably over 60,000,000 pounds of walnuts were consumed in this country. As the California crop will probably be larger this season than ever before it is naturally expected that every jobber will sell more California walnuts than on any previous season. The association will undoubtedly handle a considerably larger percentage of the crop than ever before, and announces the exclusive marketing of the product of the following new local associations: the Capistrano Walnut Growers Association at San Juan Capistrano, and the Walnut Creek Walnut Growers Association at Walnut Creek. Also in the old districts several thousand additional acres have been secured.

DON'T BE A SLACKER

The recent hot wave played havoc with the optimism of many of our ranchers and fruit growers. Many of them are perfectly satisfied that the end of all things has come. They have "lain down in the harness." They have "run out of gas." Their "differential is totally wrecked," and the joy is all taken out of life. True there is cause; the aforesaid hot wave caused damage. But, don't lose sight of the fact that if you don't think, and work, and hustle, harder than ever "the worst is yet to come."

It is the crop loss that is causing the "weeping and wailing and gnashing of teeth." It is the feeling that the crop is ruined, and in the agony of the moment there is a strong tendency to forget the future and become "slackers." That is, there is a tendency to "quit," to "lie down," to simply let things go to the "demnition bow-wow's." Orders for fertilizers have been cancelled. Orders for implements have been cancelled, orders for progressive action, work for the upbuilding of vine, tree and soil have been cancelled, and this at the time when these very things are most badly needed. Quit, is the slogan of the moment, but, it is with a comparative few.

They forget there is a future. They forget there is a season after this, that there are years to come, and many of them. They forget that this same catastrophe which affected the crop also affected the trees and vines and left them in a weakened condition, an easy prey to every enemy they have. They forget that more nourishment is needed than ever before, and more care; that they need and must have more protection from their natural enemies, for they are too weak to resist. Feed them, coddle them, destroy spider, mite and scale. Prepare for later attack from these pests, for it will probably come. Don't forget that a dusting of sulphur may save you many dollars. Work harder than you ever have before. Cultivate, fertilize, work, work, work, and watch, your next crop will be a bumper that will recoup all your losses, and you will have a strong thrifty lot of trees to carry on the work for years to come. For "cast thy bread upon the waters and it will return to thee tenfold."—Jack.

## Planting Cabbage Now

Written for California Cultivator By D. F. Reichard

SUBSCRIBER at Anaheim writes, asking: "Is it possible to set out cabbage after July 1 in order to get them off about Christmas? What

would be the best kind and time to plant? Also, will the disease in land that destroys beans destroy cabbage?"

Mr. D. F. Reichard answers the inquiry:

Yes. Cabbage may be set out during July and satisfactory results expected, provided they are supplied with plenty of water, so that they are not retarded in their growth during the warm weather. These would mature by Thanksgiving unless the late flat headed varieties, which require about five and a half months from setting, were used. As it will probably be difficult to obtain plants of this variety we would recommend planting seed of early or quick maturing varieties, such as Cannon Ball, Copenhagen Market or Winningstadt, which require about four and a half months from setting.

Sow the seed thick in drills or in beds where the soil is rich and can be conveniently watered or irrigated. In six weeks the plants should be at least eight inches high and large enough to set in the field. Set the plant as soon as possible after pulling, in the bottom or on the side of furrows that are eight or ten inches deep. Irrigate down the furrows as fast as the plants are set and keep the plants growing by frequent irri-

gation. Cultivate on the ridges between the furrows, pushing the dirt down around the plants. After the second irrigation and cultivation the land should be leveled enough so that the third irrigation will have to be made through a furrow made for that purpose between the rows of cabbage. To have cabbage head well in early winter it must be kept growing continuously, but even then if the hot weather continues late into the fall or if there are extreme changes many of the heads will not be firm and will run to flower.

As to pests, the cabbage worm will be the worst. You will be forewarned of this by the appearance of the white butterfly which deposits the eggs on the cabbage leaves. This is controlled by spraying with Paris green or arsenate of lead. Do not wait for the worms to appear but spray plants shortly after the butterflies visit them.

There may also be cabbage lice or aphids. This is controlled by spraying with Black Leaf 40 before the heads start to form. If your soil is infested with wire worms cabbage will withstand them to some extent, but if they are bad the only remedy is to keep your ground fallow for a year, not allowing anything to grow on it, thus starving the worms out.

As to the disease which affects the beans, we cannot prescribe without further details but presume it is the result of wire worm attacks.

## Late Garden

Written for California Cultivator by Mrs. F. C. Stunden

WE hear a good deal about the man and the hoe, but the new "farmers" soon find it is one thing to plant a garden and another to keep it.

Even in California, unless it is near the coast, spring is our best planting season. Young plants are inclined to dry up in the late summer, and in the fall they often are very slow getting started.

If you haven't already planned ahead, plant flat-head cabbage seed rather thick in the ground. Don't bother with a box now. They will soon be large enough to set out. If you don't have a foggy day put out in the evening and water and shade well for a few days. Flat-head cabbage matures slowly and will not burst on maturing as the peaked varieties often do.

When crops such as early carrots, lettuce, etc., are used, plant long orange carrots. They will be longer

in reaching an eating size than the short ones, and will continue to grow and keep tender till late spring.

Rutabaga, parsnips, salsify, late beets and black seed onions will all stay in the ground all winter.

Be sure to have plenty of Swiss chard. It grows slowly in the winter, so one needs plenty to insure a supply of greens.

Hubbard squashes are another good winter vegetable, and where they can have a little water it is not too late to plant them even now. They will climb a fence as well as take up a lot of ground you might use for something else.

In the fall lettuce, radishes and endive and such quick growing things can be put in, also winter radishes. Try to have another garden patch for next spring and leave the old one till the new one is bearing. In this way you can have "garden sass" the year round.

## Drying Beans and Berries

Written for California Cultivator By Mrs. F. C. Stunden, San Fernando

A subscriber some time ago wanted to know about drying string beans, also blackberries.

I dried string beans last year. They must be absolutely young and tender or they will be stringy when dried. Cut off ends and cut in short lengths. Lay without cooking in the hot sun. They dry in a few days. Store in sacks or tin cans. Cook as dried shelled beans. The flavor is not as good as fresh ones, but they are good in the winter.

We used to dry berries "back East,"

but they were rather seedy. Would suggest putting berries, cooked without sugar, in quart bottles. A funnel will aid in the canning. When wanted for pies, cook a little, adding sugar and a little flour, and pour in pie paste hot.

### THE PITY OF IT!

Addressing a political gathering the other day, a speaker gave his hearers a touch of the pathetic.

"I miss," he said, brushing away a not unmanly tear, "I miss many of the old faces I used to shake hands with."

### READ THIS LETTER

VENTURA COUNTY  
HORTICULTURAL COMMISSION  
Santa Paula, California

May 22, 1917.

Pacific Soap Company,  
Los Angeles, California.

Gentlemen—We have tried out the small samples of your new concentrated resin wash on black and soft brown scale and find it to be satisfactory in every way. A recent examination of infested trees treated shows that all scale hit of a vulnerable size were dead, and that no appreciable damage had been done to the trees treated. I am sure that if all the material put out by your company works as satisfactorily as the small samples tried by us we will use it exclusively in spray work in small citrus trees. I might add that we have long used resin wash for the control of black scale. This wash not being obtainable in a commercial form other than at prohibitive prices, we have in most cases made our own material.

A grove adjacent to the one treated with the samples of your material had been sprayed only a few days previous with resin wash made by one of our inspectors. Results obtained with your material is, I believe, a little more satisfactory than those obtained with our home-made resin wash.

Very truly yours,

(Signed) A. A. BROCK,  
County Horticultural Commissioner.

# Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

## Trimming Apricots

When should apricot trees be trimmed, especially those which are old and do not bear. Would it be advisable to trim off some of the longer limbs at this time or to wait until spring. Would trimming out of some of the limbs induce the tree to bear another year?—Subscriber, National City.

The best time to prune so as to renew or cause vigorous wood growth is when the tree is entirely dormant. However, where there is some vigorous wood on apricots severe topping or cutting back of many of the branches soon after the crop is removed from the tree, following this with heavy irrigation, gives a fall growth with plump buds which may mean the setting of a heavy crop another spring. Many deciduous fruit growers have an idea that once the fruit is off there is no demand on the tree from then until the next growing season but it must be borne in mind that the buds formed in the fall are the ones which set the next season's crop and these buds require a proper condition of the tree in the fall if it is to have vitality sufficient to set the next crop. The heavier cutting, especially thinning out useless branches, had better be deferred until the winter pruning time.

## Celery Going to Seed

We planted celery seed in the house in December. The plants were slow in coming but were in good condition when transplanted to the bed outdoors and did very well for some weeks but are now going to seed. Will you advise if the hot weather would cause the plants to go to seed?—Subscriber, Potter Valley.

This question was referred to D. F. Reichard and he answers: "This celery was started too soon. The seed usually is planted from the first of February to the first of April and the plants set out from the middle of April on for success. In planting earlier than that it is very liable to go to seed."

## Worms in Rabbits

Please advise how to treat Belgian hares with worms. Would it be advisable to treat a doe with young, or pregnant does?—Subscriber, Paradise.

Regarding worms we have the following from Townsend's "Practical Rabbit Keeping," published by Cassell & Company, Ltd., New York: "The best-known remedy is six-grain doses of areca nut every other morning in a saucer of milk. Feed early the day previous to starting the treatment, and do not give any bedding. To be effective, the medicine should be given on an empty stomach. About half a teaspoon of castor oil, given half an hour after the dose of areca nut, may be administered with advantage once or twice during the time the rabbit is being treated." Any abnormal treatment of pregnant does should be avoided if possible. If infestation is not serious would delay treatment. Will be glad to hear of breeders of any experience which may prove helpful.

## Turkeys with Swellhead

Please advise treatment for a flock of 30 young turkeys which have developed roup or swellhead. Have tried the two per cent solution of perman-

ganate of potash but lost several and none seem to have been benefited. Is there anything that can be done for them? Several are nearly blind, with swollen heads and discharge from the nose but they seem to have good appetites.—Subscriber, Burbank.

The permanganate solution could not possibly have killed your poult unless you held their heads under so long that they drowned. Some directions say hold the head under 30 seconds, but I have never dared hold it under half as long. All you want to do is to let the solution run into the nostrils and wash out the eyes. I usually dip the head under two or three times, not over five seconds at a time, and repeat twice a day. The solution should be prepared fresh every time it is used, for it soon loses its strength. As the disease seems to affect your poult's eyes especially you might try washing both and nostrils with a two per cent boric acid solution in a decoction of chamomile flowers. If you have a small syringe spray the nostril. The eyes are best washed with a little absorbent cotton. Any druggist will prepare this wash for you. A still more simple treatment would be to wash the eyes with a boric solution (a scant half teaspoonful boric acid to a glass of warm water) and anoint with pure vaseline to keep them from sticking. Most of the patent roup remedies are also quite efficient. But no treatment for roup in either chickens or turkeys is successful without removal of the cause. Where do your poult sleep? Have they perfectly fresh air at night? Are their quarters clean, are they free from lice, and have they abundant room for exercise? Poult on free range, roosting in the open ought not to have swellhead, but sometimes a roup taint in the blood reveals itself in this way in spite of the best environment.—J. A. K.

## Feed for Young Ducks

Please advise best feed for young ducks.—Subscriber, Ione.

The essential thing about the feeding of young ducks is that all food be soft. The duckling has no gizzard and cannot easily grind hard grain. Cracked corn is sometimes fed as the birds approach maturity but with this one exception all hard grain is best omitted. The ration should contain bran, corn meal, sand or fine grit and cut up greens of some sort. Many breeders add beef scrap, but this is not necessary. Middlings may be used with the bran and corn meal, if desired, and rolled breakfast oats may be part of the mash at the beginning. The first two days ducklings are given nothing but sand on a board or in a basin. Towards evening the second day some fine cracker or bread crumbs may be sprinkled over the sand. This is to give the birds a little practice in eating. The morning of the third day a mash of bran with considerable sand added, and made crumbly wet, is spread on the board and this is fed four or five times a day. At each feeding a fountain of fresh water is given. Ducklings of this tender age should not be allowed to get wet but they must have water to wash down their meal. In cold weather it is a good plan to warm the water slightly. By the tenth day a little corn meal and a little cut up green stuff (preferably alfalfa) are added to the bran mash, and the amount is gradually increased until by the end of the first month the mash consists of equal parts bran and corn meal, with from 15 to 25 per cent of greens added, and always a little

sand. If the ducklings are to be pushed for market the mash may be kept before them all the time from now on. If they are to be breeders four or five meals a day the first month, diminishing to three meals by the end of the second month, will usu-

ally be sufficient. If beef scrap is added it should be added gradually, and should never be more than ten per cent of the grain part of the mash. Beef scrap has a tendency to loosen the bowels, and hence must be used very carefully.—J. A. K.

### Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from \$15 to \$20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get over \$2 for wheat and raise 20 to 45 bushels to the acre he is bound to make money—that's what you can expect in Western Canada. Wonderful yields also of Oats, Barley and Flax. Mixed Farming in Western Canada is fully as profitable an industry as grain raising. The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. There is now an unusual demand for farm laborers to replace the many young men who have volunteered for service in the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to GILBERT ROOHE

Canadian Government Exhibit, San Diego, Cal.

## The Golden Gate Weed Cutter

cuts seven feet or less, weighs 230 pounds and is all made of steel. The Golden Gate Weed Cutter is the greatest of its kind on the market. For workmanship, simplicity and durability it cannot be excelled as it does its work to perfection. Those who are using it say that no money could buy it if they could not get another. It not only cuts all kinds of weeds, but cultivates the ground as well. One user said that it has saved him \$200.00, as he did not have to plow after using.

## Garden Planning

Written for California Cultivator By E. Branton

THE most difficult task about gardening is not how to grow plants, for if one sort of plant does not thrive in its present location, another may, and in no event will failure of one, or even many plants, spoil a garden or estrange the owner from a deep interest in and love for the garden. In many instances such failure has stimulated his interest in plant life and determined him upon a course whereby he could through experience find out what best he could grow and best pleased him.

The real problem of the garden is the plan, for once planted with trees and shrubs the plan is difficult to change after some years of active growth and development. We are still somewhat in the period of revolution or evolution in garden planning and planting. Years ago, and not many years either, we were all for artificial and unnatural effects. The plan was purposely and too often hopelessly formal or conventional. No attempt was made looking to ease or comfort. It seemed as though all considered it easier to walk around a square corner than a rounded one and that a right-angled path or road was a better and perhaps shorter route between two given points than one of gently-flowing curves. No stretch of green lawn was permissible unless it was embellished with one or more carpet beds of geometric design, composed of plants of bizarre hues, beet-top and variegated colors predominating. The actual effect of such a bed or beds on a smooth stretch of lawn is comparable to one or more angry fever sores upon an otherwise fair face.

Now the pendulum is still swinging toward the other extreme, though its course is nearly run, and a return to the point of greatest gravity will eventually ensue. It must not be expected that a garden, at least that portion about the house or any part of a city lot, shall be so natural as to appear a part of the wilds, any more than we expect houses to appear as caves. We cannot return to primal conditions, nor do many of us have such desires. Those who make the attempt are objects of just ridicule by their fellows, whether pertaining to personal habits and dress or to gardens. But we are sick of meaningless bright dabs or daubs of color, "specimen" trees, shrubs, and other plants, and of those clipped into conventional forms. We desire and admire smooth unbroken stretches of lawn and natural masses of trees and shrubs and irregular zones of one sort of flowering plant merging and mixing "in transit" to a bed of another sort. We wish easy lines, no corners, and gentle curves in design, garden seats, arbors, and all that contributes toward comfort and

enjoyment in the garden. We come more and more to regard it as an outdoor living room, even dining and sleeping therein to a degree never expected a generation back of the present. Utility, art and nature should combine and conspire to make a garden both lovable and livable. When this has been accomplished you have succeeded most admirably in a close approach to the ideal garden.

### Plant Culture

All things are possible in plant culture in California, though in some cases special conditions must naturally exist or be created. We have been told, at various times, that we cannot grow peonies, rhododendrons, azaleas, alpine plants, edelweiss, bog plants such as the insectivorous class, and a host of others of special requirements. But all such have been and are growing in many parts of California. One may need a northern slope, to first grow a shelter or shade of trees and shrubs, or to have a stream or body of water. But when these exist or are supplied we may grow any plants that can be grown by mankind in any land. So do not despair; get your favorite or fancied plants, study their needs, supply them if you can, and success should attend your efforts.

### Changes in Names

At last we are to have stability in both popular and scientific names. Committees from all interested national organizations were appointed and met to discuss ways and means to obtain uniformity, and they have already sent out the first list of names. Without being too technical it may be stated that the tendency of the day is toward simplicity and reduction of numbers in general. This is a severe blow at official hair splitting. To cite a local example; many years ago our Christmas berry was separated from Photinia, a genus of several species, and called Heteromeles, making one more name. Now it is returned to Photinia, simplifying the whole matter and reducing the number of names we have to use. Some day the layman may yet concede that botanists are wholly sane and therefore safe to be at large.

### Gladiolus Catalog

Cornell University, Ithaca, New York, has issued a 174-page catalog of gladiolus by Prof. A. C. Hottes that describes accurately all the sorts now on the market, giving names of all that are the same in flower, thus cutting out many repetitions for dealers. These bulletins are free to residents of New York, but I would advise outsiders to send not less than ten cents in stamps when asking for a copy. No attention may be paid to request not accompanied with stamps or coin.

## Torrens Title Accepted

IT SEEMS that the Torrens title will be accepted by the federal land bank in making farm loans, but only in cases where the title has been issued twelve or more months. There are practically no Torrens titles issued in this state that far back but many are being secured every day now. Those who contemplate borrowing in the future from the federal land bank should secure their Torrens titles at once. It appears that

the Torrens title will be vastly cheaper than securing an abstract. The only other title accepted is where a policy has been issued by a title insurance company. Bear in mind this is a policy and not a certificate of title, hence at best it appears that the securing of a loan from the federal bank will be more or less expensive. However, more specifically, we give by courtesy of President White of the land bank at Berkeley copy of circular letter issued to secretary-treasurers of various loan associations.

"To Secretary-Treasurers:

"The question of determining of

titles has received the serious consideration of the officers of this bank. The bank has been obliged to take into consideration the necessity for certainty as to titles as well as the question of expense to its borrowers.

"Notwithstanding the Federal Farm Loan Board has authorized the bank to make a charge to borrowers for examination of titles, the bank will not make such charge at this time, but reserves the right to change its policy in that regard if it should find that the expense of examination becomes so heavy as to make it necessary.

"Inasmuch as the success of the federal farm loan banking system depends upon the sale of its bonds, every element entering into the security of the bonds must be zealously guarded. Certainty as to title is one of those elements.

"The bank gives the following as its position with reference to evidence of title and requests that all former advice be disregarded if in conflict therewith:

"First: Abstracts of title will be accepted.

"Second: Policies of title insurance will be accepted, although the company issuing same must first be approved by the bank, and, providing further that no policy of title insurance will be accepted as an original issue but only in cases where a policy is already outstanding.

"Third: A certificate under the Torrens law will be accepted provided twelve months will have elapsed between the date of judgment in the proceeding under the Torrens law and the time of closing a loan from the bank.

"Fourth: Ordinary certificates of title will not be accepted.

"In coming to the foregoing conclusions the bank has had in mind that national farm loan associations will be able to make advantageous arrangements for the making of abstracts; if reasonable and fair contracts for their making cannot be made with local searchers of records, then this bank stands ready to send into your county competent searchers of records, who, under contract with the bank, will do the work for the members of your association at actual cost. You and your board of directors should be able to determine whether local abstract companies are offering you fair and reasonable terms. If they do, then accept such. If, however, they do not, then you should report to the bank and it will take steps to provide abstracts of title for your members at their actual cost. Abstracts of title should not be ordered until you receive notice from the bank of the granting of the applications for loans.

"The secretary-treasurer of many associations is also a notary public; some are fire insurance agents. Wherever charges for service are standardized, such as fire insurance premiums written in board companies, and charges for notarial work, the bank knows of no reason why a secretary-treasurer when rendering such service may not make the customary charge against association members. However, all commissions should be limited to such classes of service. Under no circumstances should a commission be charged or any compensation accepted by a secretary-treasurer in the contracting for abstracts of title.

"Secretary-treasurers will be required to furnish an itemized statement showing the source of all fees and other compensation received in connection with their services as secretary-treasurers. In all such matters no secretary-treasurer should accept compensation in any form unknown to his association.

"In making all such arrangements, as are herein referred to, secretary-treasurers should lay such matters before the board of directors.

"All communications from the federal farm loan board or the bank should be laid before the board of directors at the meeting next following receipt of same."

REVIVING OLD ORCHARD

In treating tree trunks with concrete, as advised in a former Cultivator, I would suggest that after thoroughly scraping and cleaning the interior of the cavity the surface should be disinfected and a covering of asphalt used before the cement is filled in.—G. F. C.

How to Keep Cereals and Flour

Neither cereals nor flour will keep indefinitely. During warm weather cereals will germinate within 30 days, and sooner if kept in a warm room or kitchen where the temperature is above 65 degrees. Cereals will spoil more quickly than flour.

Flour should remain in good condition for at least four months after milling, if the mill is modern, clean and flour is manufactured under proper and sanitary conditions.

Keep both cereals and flour in a clean, cool, dry place, where the cool air can circulate freely. Flour will improve in quality, age naturally and make better bread, biscuits and cake if left in the standard cotton sack used by at least 95 per cent of the mills in the United States. Glass jars, tin receptacles or any air-tight container should be avoided, as they prevent aeration of the flour, which is necessary for proper maturing. If your storage room is sufficiently large and it is your intention to carry stocks for a long period, you will obtain the best results by plac-

ing your flour or cereals on a small table in the center of your storage room, and at least once each month brush off the sacks, packages and table on which the goods are placed. We do not advise hoarding supplies, but this information is given with the desire to prevent loss and waste to those who have purchased supplies in excess of their immediate requirements.

The first essential for every purchaser to consider is whether or not stocks purchased are freshly milled. It is well to remember that with the present scarcity of freight cars, vessels and tonnage of all kinds, it is practically impossible for an eastern or northern miller to manufacture and deliver flour or cereals in California under 30 days. As a matter of fact, most of the flour and cereals shipped to this market are more than 60 days old before they reach the consumer. All of the cereals and flour required by the people of California can be manufactured by the mills in this state, and for general family use no better flour is made, regardless of rice.—O. H. M.

Book Review  
"BUSH FRUITS"

"Bush Fruits," by F. W. Card; published by the Macmillans, New York; \$1.75.

The publishers say: "First published in 1898 when the author was professor of horticulture in an agricultural college, this book has come to be regarded as standard in its field. It now appears entirely revised and rewritten by Professor Card, who has in the meantime had experience in the growing of fruits and who knows the various problems which confront the amateur and professional grower from both the practical and the theoretical end. The chapters on insects and diseases were prepared by specialists; the articles on the handling and disposal of the crop describe the latest practices; the science as well as the instruction and advice of the actual commercial gardener are here. Currants, gooseberries, blackberries, raspberries, dewberries and blueberries are all taken up in turn, as are several other small fruits, and full information on each is given."

There are 17 chapters in the more than 400 pages of well printed text, with many illustrations. There is also one chapter devoted to miscellaneous types of bush fruits. It is the most complete treatise on these small fruits we have ever seen.

# WATER TANKS

For thirty years we have been building tanks, towers and wooden pipe lines. Our engineers and manufacturing organization have developed knowledge and skill, which are at your disposal.

From a 500-gallon plain water tank for a small farm, a battery of four silos for a big stock ranch, an outfit of 200 tanks for the Hercules Powder Company at San Diego, California, valued at \$150,000, to municipal and irrigating plants of the largest capacity, our business has grown year by year.

Your inquiry will bring a prompt reply.

May we suggest that you write fully concerning your needs, to the end that we may render you intelligent and efficient service?

Cultivator when writing the advertiser.**THIS WEEK'S COVER**

Why would one wish to go to mountains or to beach if there were as many shady nooks about the home as there are about the home depicted on this week's cover? It may be imagined that this scene is taken in some naturally wooded land, in fact, it is not far from "Woodland" in Yolo County, and advantage has been taken of the great white oaks which dot the landscape of that county, but where one is out on the plain, or in fact almost anywhere in California, a similar wooded scene may be created for the eucalyptus and many other trees are most rapid growers. Let us encourage more general growth of trees about the home.

**SAWING WOOD**

George Ade says: "The world is roughly divided into two classes—those who saw wood, and those who sit on the fence and tell others how to saw wood," and of all the years when our "advisers" sit on the fence and give instruction to the farmer this year takes the plum and the cake and all the other good things of the pantry. It has become almost sickening to the farmer—who, spurred on by patriotic spirit and his own interests, backed by years of experience, has been doing his best—to listen to some of the bunk which has been passed on to him. However, we are doing pretty well, thank you, and in spite of all obstacles and advice—and some weather—the farmer will still win the war.

**HEAT KILLING SCALE**

One of Los Angeles County's horticultural inspectors, J. W. Mashmeyer, of Pomona, says we did not quote him strictly correct in the account of the Claremont Pomological

Club meeting in our last issue. We made him say that he "had made most careful investigation of the effect of the heat on the insects and found that not only were the young scale killed but eggs showed no sign of life." We then added that all who spoke on the subject had recommended that fumigation be followed as usual, etc. Now there are scale left in every orchard. Mr. Mashmeyer has said that there has been a very great benefit to orchards to this extent, at least, that the heat has destroyed the lives of many insects; also another benefit will be in that the hatch of the remainder of the eggs will be much more uniform this year than any preceding year. This will enable practically a hundred per cent of kill with thorough treatment. Mr. Mashmeyer and all who are studying the scale question closely are urging fruit growers to take advantage of the present condition and clean up the orchards. Probably no such opportunity will occur again.

**SOLANO FIRE PROTECTION PLAN**

Farmers! Solano County farmers are wise to needs of fire protection for grain fields.

The Board of Supervisors have made \$2500 appropriation and the farmers have established thirteen fire stations in the grain growing districts. Each of these stations is equipped with an automobile trailer on which there are ten fire extinguishers, five ten-gallon cans of water, shovels, wire brooms and other paraphernalia for fighting field fires.

In each district a number of automobile owners have pledged the use of their machines in rushing trailers to any place where a fire breaks out. There is also a volunteer force of twenty farmers for each trailer.

Fires may or may not be incendiary, but in any case they are coming all too frequently.

Be prepared.

Again, regarding the heat killing all the scale, it must be borne in mind that every black scale is capable of hatching 3000 or more young. If 2900 youngsters of each scale are destroyed the slaughter is great but the increase is still a hundred-fold, therefore the usual claim of "all the scale are killed by heat" must be taken with due allowance.

**STOPPING THE WASTES**

The fruit grower is finding compensation because of the "hot spell." The nation is finding compensations because of war. It is destructive, economically, physically, morally. But to lessen that destruction so far as possible the nation is being taught to stop the wastes, be more economical with food, with all resources, and more efficient in all service.

The food speculator and gambler are dying hard, but their power will certainly be greatly reduced. Now congress has said that the destruction of grains in the making of all strong drinks must stop. The use of barley in beer manufacture is passed up to the president.

Not content with any action congress might take, the strongest farmers' organization in California—The Farmers' Protective League—is appealing for more efficient help, and to that end is appealing to boards of supervisors in various counties with the following:

Board of Supervisors  
of \_\_\_\_\_ County.

At a recent mass meeting held in Sacramento, composed of representative farmers from different parts of the state, which meeting was called together to consider the present agricultural labor shortage and to devise ways of most efficiently harvesting crops with means at hand; one of three resolutions adopted is as follows:

And, whereas, The efficiency and health of many farm laborers is materially injured by the lawlessness of certain saloons;

Be it resolved, That the Farmers' Protective League, as a war measure, call upon all county councils of defense, county boards of supervisors and town governments to enforce existing laws and to cancel every license that is a menace to agricultural efficiency.

The Farmers' Protective League was asked and authorized to follow up this resolution, known as resolution number three, hence calls upon the various county and local governments to the end that your attention may be called to the necessity of enforcing existing laws and otherwise regulate saloons in prohibition of the sale of liquor to intoxicated persons, as a war measure and in the interests of agricultural efficiency.

Thus, with the intention of carrying out the spirit of this meeting, this letter and resolution is most respectfully submitted to you.

FARMERS' PROTECTIVE LEAGUE.

**ROBERT H. LOUGHRIDGE**

Announcement of the death of Robert Hills Loughridge, noted as a soil chemist and geologist and Professor of Agricultural Chemistry, Emer-

itus, in the University of California, in Waco, Texas on Sunday morning, July 1, was made by the University of California.

Since his retirement from active service in the university in 1909 Professor Loughridge had not been in robust health. He was one of the most tireless investigators, working with Dr. Hilgard in the University of California since 1891. He made particular study of methods of reclaiming alkali lands and of the questions of irrigation and drainage. With all his other high qualities he was a most genial and likable man.

**FARM LOAN MUDDLE**

The producing interests have expected much of the federal farm loan banks. The one which is to handle the business for the Pacific Coast has been located at Berkeley. Applications have been filed and a few loans have been made. Some have felt that it has taken longer to secure action than should be the case. However, the would-be borrowers have been fairly patient. During the last few weeks those closer to the inner circle have imagined things were not running smoothly. San Francisco dailies about two weeks ago began to question as to the trouble brooding over the federal farm loan bank. We understand this was denied by President White but about the first of the month public announcement was made of the resignation of Dr. Elwood Mead of California and R. L. Douglas of Nevada. It was rumored that Prof. Thomas of Utah also tendered his resignation, but this was held up for the time being. All who know Dr. Mead appreciate the fact that he is no quitter and that with his great interest in advancing the welfare of the producers of California he would not discontinue his work with the federal farm loan bank if there were still opportunity for service. The San Francisco Chronicle states:

"Immediately following the intelligence at Washington, Commissioner Norris replied urging every effort to restore harmony. He forwarded two wires to each member of the board, in which it was indicated that an attache of the commission would be sent West at once to survey the situation. Friends of the retiring board members declare that it has been impossible for them to work with President White, who is charged with concentrating the labor of the board in his own hands to the complete exclusion of the others."

There is no man on the Pacific Coast who would give the bank such a standing with producers as Dr. Mead and we regret that the action of the management has been such as to cause this great movement to lose the services of a man of his type. A bit more of the history is given in the Chronicle of July 3, as follows: "The history of the present outburst dates back to the time when Secretary of the Treasury William McAdoo visited the Coast in advance of Herbert Quick, George W. Norris and W. S. A. Smith. During that trip Mead was freely consulted and urged to take the presidency of the bank. Mead declined, because of his university duties, but offered his service as a director. He was then asked to suggest others, and when McAdoo left the Coast it was thought that the personnel of the board was agreed upon. The surprise followed with the naming of White, a stranger to Mead and his associate in farm economics and finance. Thomas and Mead were the only two of the original suggestions to remain in the nominated list of directors.

"It subsequently developed that White was a law partner of George Lane, and Professor George Elliott of the law department of the State University. Lane is a brother of Secretary of the Interior Franklin K. Lane, and Elliott married a sister of President Woodrow Wilson's first wife. The suggestion of politics was scented and accepted as correct. The second upset came when, instead of allowing the board to organize itself, White was named as president as well as director."

**Agricultural Notes**

Serious injury to the bean crop of France was caused by bean thrips.

Ontario, Canada's, output of potatoes will be vastly larger than any preceding year.

New Zealand prohibits the exportation of wheat and flour, meat, hides, wool and rabbits.

The Spanish government permits export of 40,000 tons of potatoes with an export tax of 41 cents per cwt.

Immense shipments of agricultural implements will be made to India as soon as transportation can be secured.

The Barbados Islands have passed a law prohibiting slaughter of immature animals or cows carrying young.

American woodmen are working both in English and French forests, to provide timbers for military purposes.

The Canadian government is providing tractors for farm sections where farmers are unable to purchase.

The average condition of the wheat crop for Canada is 84 per cent of a full crop, while the year preceding it was 90 per cent.

Chicago packers have agreed to stop entirely the slaughter of all ewe lambs and turn them over to farmers for breeding purposes.

Markarian, Fresno fig grow- orchard is said to be the g orchard in the world, is

leading a new fig packing industry which it is thought will bring prosper- ity to Central California fig growing sections.

The manager of the Prune and Apricot Growers Association recently fixed upon a 6¼ cent basis for prunes, September shipment; 40s, 50s to command a half cent advance. California will ship this year about 200,000,000 pounds of prunes.

San Joaquin Valley fruit growers are receiving very satisfactory prices for fruits. Prices are generally running about 25 to 50 per cent higher than highest prices of last year. Last year's canning peaches ranged around \$27.50 and \$30.00. This year canneries are freely paying \$50.00 for canners, \$30.00 for Elbertas, Fosters and Lovells. Malaga grapes are running around \$30.00 and \$35.00, Thompsons and Cornichon's \$30.00, Emperors \$50.00. Dried apricots have sold as high as 17 cents.

## Southern California

The cannery at Banning opened about July 1.

The Pomona cannery opened on apricots June 28.

Imperial Valley watermelons are moving out at the rate of about 20 carloads daily.

A five-stand gin for handling Egyptian cotton is on the way to Blythe, Palo Verde Valley.

Navel orange growers of California feel that the coming year's crop will be almost a total loss.

Beaumont fruit growers are planning to start at once on a squirrel extermination campaign.

Cantaloupe oil is the latest suggestion for use of off grade cantaloupes of the Imperial Valley.

Pomona fruit growers are operating cooperatively dry yards formerly owned by G. H. Waters.

A fruit packing house in Beaumont, Riverside County, is having its capacity more than doubled.

One bee keeper on the "desert" out in the Palo Verde Valley, recently shipped a carload of honey.

The box shook shortage has been largely overcome and now citrus shippers are faced with a car shortage.

The flood crest of the Colorado River has passed and Palo Verde and Imperial Valley farmers are breathing easier.

W. L. Churchill is the new manager to take charge of affairs of the Lima Bean Growers Association at Oxnard.

Twelve extra train crews were required daily to handle cantaloupes out of Imperial Valley during the height of the season.

Ventura County bean growers report injury to the bean crop by the hot wave was not as severe as first anticipated.

The sugar factory at Oxnard, Ventura County, is installing equipment for conversion of the wastes of the factory into potash.

Apple and melon men are investigating advisability of branding each individual fruit by using a new electrical branding machine.

Riverside County alfalfa growers recently met and discussed plans of stabilizing the market and securing fair return to members.

The San Bernardino Valley Producers Association has received \$25,000 for potatoes sold this season. They are receiving around \$3.75.

The Coachella Valley Date Growers Association is discussing methods of extermination of the scale of date trees, also the matter of marketing of dates.

While the scale pest has been hit by the hot wave investigators are urging continuance of the fight against the pest to accomplish almost complete eradication.

A water storage project calling for the investment of approximately \$2,000,000 is contemplated for San Dimas Canyon, Los Angeles County. It will create a lake covering 500 acres.

Because of pre-cooling demands and general volume of business the creamery at Brawley, Imperial County, will increase its capital from \$75,000 to \$250,000, to be invested largely in refrigerating equipment.

## The Coast

Chandler, Arizona, has a live boys' pig club.

Douglas County, Oregon, has 2000 acres of beans.

Idaho's wheat acreage increased over 10 per cent this year.

Idaho will produce over 2,000,000 bushels of apples this year.

California grown sweet corn is selling in Seattle at 85 cents per dozen.

Carloads of strawberries are moving out of the Hood River section of Oregon.

Rabies is destroying vast numbers of coyotes on the plains of Eastern Washington.

The disaster of a large forest fire near Douglas, Arizona, was lessened by timely rains.

The Idaho Poland-China futurity will be a strong feature at the Idaho State Fair at Boise this year.

Prune growers of Salem, Oregon, have formed a pool comprising about 1700 acres of prune orchards.

One silo construction center of Yamhill County, Oregon, recently shipped five carloads of silos.

Forty members of boys' and girls' club work in Arizona will receive free trips to the state fair this fall.

Shortage of feed in some portions of Arizona and New Mexico is making a serious problem for many range owners.

One Oregon wool grower recently sold 17,000 pounds of wool for \$8,500. He also closed out a number of five-year-old ewes at \$10 per head.

The Oregon Agricultural College will defer opening this year until October 28, this to permit pupils to work on farms as late as possible.

Silos are becoming fashionable in Arizona, one section near Tucson has nearly a score under construction, with a total capacity of over 4000 tons.

Union stock yards were opened at Pasco, Washington on June 25, the first day's sales aggregating \$15,000. The total cost of the yards was under \$20,000.

The Northwest Live Stock Association will hold its next live stock show at Lewiston, Idaho, November 8 to 15. The state legislature makes liberal appropriations for premiums.

The Arizona Council of Defense has appointed a lady to take charge of various districts and encourage more complete conservation of food supplies through canning and drying clubs.

Members of the Oregon Cattle and Horse Raisers' Association are planning a trip through the interior counties of Oregon, the object being securing information for members and building up the membership.

The White River Valley, Washington, Cow Testing Association reports membership of 680 cows, the best cow for the month of May making a showing of 90.39 pounds. A great number of cows ranged above the 60-pound mark.

State and other large fair dates for the Northwest are: Pendleton Round-up September 20-22; Idaho State, Boise, September 22-29; Oregon, Salem, September 24-29; Montana, Helena, September 24-29; Northwest Live Stock, Lewiston, November 16-23; Pacific National Dairy, Portland, November 16-23; Pacific International Live Stock, Portland, November 19-24.

road commission and the water users anticipate greater efficiency of their lands.

Rice growers of Butte County are contemplating marketing rice in attractive cartons. An effort is being made to have the packing done in Butte County but if impracticable will have it done in Eastern packing houses.

The late spring frost, which it was feared might greatly lessen the output of fruit, has proven far less disastrous than anticipated. Commissioner Gould of Yolo County reports peach, plum, prune and grape crops turning out well.

A cherry grower at Redding, Shasta County, has saved his crop by rigging a number of scarecrows through the orchard, each having attached to it a cow bell and these bells in various parts of the orchard are rung day and night by jerking cords connected with a water wheel.

**OUR ADVERTISERS RELIABLE**

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

**THIS WEEK'S COVER**

Why would one wish to go to mountains or to beach if there were as many shady nooks about the home as there are about the home depicted on this week's cover? It may be imagined that this scene is taken in some naturally wooded land, in fact, it is not far from "Woodland" in Yolo County, and advantage has been taken of the great white oaks which dot the landscape of that county, but where one is out on the plain, or in fact almost anywhere in California, a similar wooded scene may be created for the eucalyptus and many other trees are most rapid growers. Let us encourage more general growth of trees about the home.

**SAWING WOOD**

George Ade says: "The world is roughly divided into two classes—those who saw wood, and those who sit on the fence and tell others how to saw wood," and of all the years when our "advisers" sit on the fence and give instruction to the farmer this year takes the plum and the cake and all the other good things of the pantry. It has become almost sickening to the farmer—who, spurred on by patriotic spirit and his own interests, backed by years of experience, has been doing his best—to listen to some of the bunk which has been passed on to him. However, we are doing pretty well, thank you, and in spite of all obstacles and advice—and some weather—the farmer will still win the war.

**HEAT KILLING SCALE**

One of Los Angeles County's horticultural inspectors, J. W. Mashmeyer, of Pomona, says we did not quote him strictly correct in the account of the Claremont Pomological

Club meeting in our last issue. We made him say that he "had made most careful investigation of the effect of the heat on the insects and found that not only were the young scale killed but eggs showed no sign of life." We then added that all who spoke on the subject had recommended that fumigation be followed as usual, etc. Now there are scale left in every orchard. Mr. Mashmeyer has said that there has been a very great benefit to orchards to this extent, at least, that the heat has destroyed the lives of many insects; also another benefit will be in that the hatch of the remainder of the eggs will be much more uniform this year than any preceding year. This will enable practically a hundred per cent of kill with thorough treatment. Mr. Mashmeyer and all who are studying the scale question closely are urging fruit growers to take advantage of the present condition and clean up the orchards. Probably no such opportunity will occur again.

**SOLANO FIRE PROTECTION PLAN**

Farmers! Solano County farmers are wise to needs of fire protection for grain fields.

The Board of Supervisors have made \$2500 appropriation and the farmers have established thirteen fire stations in the grain growing districts. Each of these stations is equipped with an automobile trailer on which there are ten fire extinguishers, five ten-gallon cans of water, shovels, wire brooms and other paraphernalia for fighting field fires.

In each district a number of automobile owners have pledged the use of their machines in rushing trailers to any place where a fire breaks out. There is also a volunteer force of twenty farmers for each trailer.

Fires may or may not be incendiary, but in any case they are common all too frequently. Be prepared.

Again, regarding the heat killing all the scale, it must be borne in mind that every black scale is capable of hatching 3000 or more young. If 2900 youngsters of each scale are destroyed the slaughter is great but the increase is still a hundred-fold, therefore the usual claim of "all the scale are killed by heat" must be taken with due allowance.

**STOPPING THE WASTES**

The fruit grower is finding compensation because of the "hot spell." The nation is finding compensations because of war. It is destructive, economically, physically, morally. But to lessen that destruction so far as possible the nation is being taught to stop the wastes, be more economical with food, with all resources, and more efficient in all service.

The food speculator and gambler are dying hard, but their power will certainly be greatly reduced. Now congress has said that the destruction of grains in the making of all strong drinks must stop. The use of barley in beer manufacture is passed up to the president.

Not content with any action congress might take, the "strongest farmers' organization in California—The Farmers' Protective League—is appealing for more efficient help, and to that end is appealing to boards of supervisors in various counties with the following:

Board of Supervisors  
of \_\_\_\_\_ County.

At a recent mass meeting held in Sacramento, composed of representative farmers from different parts of the state, which meeting was called together to consider the present agricultural labor shortage and to devise ways of most efficiently harvesting crops with means at hand; one of three resolutions adopted is as follows:

And, whereas, The efficiency and health of many farm laborers is materially injured by the lawlessness of certain saloons;

Be it resolved, That the Farmers' Protective League, as a war measure, call upon all county councils of defense, county boards of supervisors and town governments to enforce existing laws and to cancel every license that is a menace to agricultural efficiency.

The Farmers' Protective League was asked and authorized to follow up this resolution, known as resolution number three, hence calls upon the various county and local governments to the end that your attention may be called to the necessity of enforcing existing laws and otherwise regulate saloons in prohibition of the sale of liquor to intoxicated persons, as a war measure and in the interests of agricultural efficiency.

Thus, with the intention of carrying out the spirit of this meeting, this letter and resolution is most respectfully submitted to you.

FARMERS' PROTECTIVE LEAGUE.

**ROBERT H. LOUGHRIDGE**

Announcement of the death of Robert Hills Loughridge, noted as a soil chemist and geologist and Professor of Agricultural Chemistry, Emer-

itus, in the University of California, Waco, Texas on Sunday morning, July 1, was made by the University of California.

Since his retirement from service in the university in 1908, Professor Loughridge had not been in poor health. He was one of the tireless investigators, worked with Dr. Hilgard in the University of California since 1891. He made a study of methods of reclaiming alkali lands and of the question of irrigation and drainage. With other high qualities he was a genial and likable man.

**FARM LOAN MUDDLE**

The producing interest in the federal farm loan banks. The one which handles the business for the Pacific has been located at Berkeley. Applications have been filed and a few loans have been made. Some have felt that it has taken longer to secure action than should be the case. However, the would-be borrowers have been fairly patient. During the last few weeks those closer to the inner circle have imagined things were not running smoothly. San Francisco dailies about two weeks ago began to question as to the trouble brooding over the federal farm loan bank. We understand this was denied by President White but about the first of the month public announcement was made of the resignation of Dr. Elwood Mead of California and R. L. Douglas of Nevada. It was rumored that Prof. Thomas of Utah also tendered his resignation, but this was held up for the time being. All who know Dr. Mead appreciate the fact that he is no quitter and that with his great interest in advancing the welfare of the producers of California he would not discontinue his work with the federal farm loan bank if there were still opportunity for service. The San Francisco Chronicle states:

"Immediately following the intelligence at Washington, Commissioner Norris replied urging every effort to restore harmony. He forwarded two wires to each member of the board, in which it was indicated that an attache of the commission would be sent West at once to survey the situation. Friends of the retiring board members declare that it has been impossible for them to work with President White, who is charged with concentrating the labor of the board in his own hands to the complete exclusion of the others."

There is no man on the Pacific Coast who would give the bank such a standing with producers as Dr. Mead and we regret that the action of the management has been such as to cause this great movement to lose the services of a man of his type. A bit more of the history is given in the Chronicle of July 3, as follows: "The history of the present outburst dates back to the time when Secretary of the Treasury William McAdoo visited the Coast in advance of Herbert Quick, George W. Norris and W. S. A. Smith. During that trip Mead was freely consulted and urged to take the presidency of the bank. Mead declined, because of his university duties, but offered his service as a director. He was then asked to suggest others, and when McAdoo left the Coast it was thought that the personnel of the board was agreed upon."

New Zealand prohibits the exportation of wheat and flour, meat, hides, wool and rabbits.

The Spanish government permits export of 40,000 tons of potatoes with an export tax of 41 cents per cwt.

Immense shipments of agricultural implements will be made to India as soon as transportation can be secured.

The Barbados Islands have passed a law prohibiting slaughter of immature animals or cows carrying young.

American woodmen are working both in English and French forests, to provide timbers for military purposes.

The Canadian government is providing tractors for farm sections where farmers are unable to purchase.

The average condition of the wheat crop for Canada is 84 per cent of a full crop, while the year preceding it was 90 per cent.

Chicago packers have agreed to stop entirely the slaughter of all ewe lambs and turn them over to farmers for breeding purposes.

# Agricultural News Notes of the Pacific Coast

## Northern California

Solano County is fighting artichoke thistle.

Agents of the British government are buying grain in Butte County.

Butte County prune growers are hoping to sell on a six-cent basis.

California's output of barley will be 2,000,000 bushels greater than last year.

The Placer County farm bureau has a purchasing and marketing department.

Sonoma County's blackberry and Loganberry fields are turning out immense crops.

The extremely warm weather of the middle of June hastened ripening of all grain and fruit crops.

Yolo County has had several field fires which have caused immense destruction in grain sections.

A large tract of marsh land will be drained and made productive near Ferndale, Humboldt County.

To correct labor conditions it has been suggested that large numbers of negro helpers be secured from the South.

There have been resignations of two members of the board of directors of the federal farm loan bank at Berkeley.

Humboldt County dairymen are making a strong appeal for the continuance of the office of farm adviser in that county.

E. J. Vosler has returned from a four-months' trip to Australia and brings a supply of parasites for the beet leaf hopper.

It is estimated that California will produce about 5,600,000 bushels of wheat this year. The crop will be slightly greater than last year.

Creameries of Humboldt County made largest returns for May and June butterfat of any preceding year. Prices varied from 37½ to 43 cents.

A new grandstand and other improvements are being made on the fair grounds at Ferndale, Humboldt County, in readiness for the fair to be held August 1-4.

The cannery at Yuba City will start its run later this year because of lateness of season. The first run last year was on July 12. This year it will not be before the 20th.

The Water Users Association, with holdings in Yolo County, has won a victory in the hearing before the railroad commission and the water users anticipate greater efficiency of their lands.

Rice growers of Butte County are contemplating marketing rice in attractive cartons. An effort is being made to have the packing done in Butte County but if impracticable will have it done in Eastern packing houses.

The late spring frost, which it was feared might greatly lessen the output of fruit, has proven far less disastrous than anticipated. Commissioner Gould of Yolo County reports peach, plum, prune and grape crops turning out well.

A cherry grower at Redding, Shasta County, has saved his crop by rigging a number of scarecrows through the orchard, each having attached to it a cow bell and these bells in various parts of the orchard are rung day and night by jerking cords connected with a water wheel.

## Central California

Tulare County hopes to have a farm adviser.

A large fruit packing house is being erected at Turlock.

A cattle rustler was recently sentenced to nine years in San Quentin.

The cantaloupe shipping season will open in Stanislaus County about July 25.

Oakdale, Stanislaus County, reports almond orchards bending under the load of fruit.

Many San Joaquin Valley ranchers report thefts of wheat and other grains from the fields.

The California Rodeo begins at Salinas, Monterey County, next Wednesday, July 18.

Terra Bella, Tulare County, recently shipped a car of grain direct to the allies in Europe.

Pajaro Valley apple growers are discussing rubber stamp for marking each individual fruit.

One gopher succeeded in shutting off the light and power from Fresno City by a break in a canal.

Forty-five per cent more of the hold-over raisin crop has been disposed of than last year same date.

Madera and Fresno Counties will unite in building a bridge on a fifty-fifty basis over the San Joaquin river.

Salinas, Monterey County, is boasting that it is becoming one of the most important live stock centers of California.

County Horticultural Commissioner Rouillard of Fresno, because of lack of space in the county court house, will move his offices to the Holland building.

The state now allows a bounty of \$20 for male mountain lions and \$30 for females. The state has paid \$50,000 in the last ten years in bounties for lions.

The Stanislaus County Farmers' Union has purchased three warehouses and will conduct a general buying and selling business, handling grains, fruit and feeds.

Tulare County has been working for some time to secure the necessary one-fifth of her farmers as members of the farm bureau and now considers a farm adviser for that county assured.

Henry Markarian, Fresno fig grower, whose orchard is said to be the largest fig orchard in the world, is heading a new fig packing industry which it is thought will bring prosperity to Central California fig growing sections.

The manager of the Prune and Apricot Growers Association recently fixed upon a 6¼ cent basis for prunes, September shipment; 40s, 50s to command a half cent advance. California will ship this year about 200,000,000 pounds of prunes.

San Joaquin Valley fruit growers are receiving very satisfactory prices for fruits. Prices are generally running about 25 to 50 per cent higher than highest prices of last year. Last year's canning peaches ranged around \$27.50 and \$30.00. This year canneries are freely paying \$50.00 for canners, \$30.00 for Elbertas, Fosters and Lovells. Malaga grapes are running around \$30.00 and \$35.00, Thompsons and Cornichon's \$30.00, Emperors \$50.00. Dried apricots have sold as high as 17 cents.

## Southern California

The cannery at Banning opened about July 1.

The Pomona cannery opened on apricots June 28.

Imperial Valley watermelons are moving out at the rate of about 20 carloads daily.

A five-stand gin for handling Egyptian cotton is on the way to Blythe, Palo Verde Valley.

Navel orange growers of California feel that the coming year's crop will be almost a total loss.

Beaumont fruit growers are planning to start at once on a squirrel extermination campaign.

Cantaloupe oil is the latest suggestion for use of off grade cantaloupes of the Imperial Valley.

Pomona fruit growers are operating cooperatively dry yards formerly owned by G. H. Waters.

A fruit packing house in Beaumont, Riverside County, is having its capacity more than doubled.

One bee keeper on the "desert" out in the Palo Verde Valley, recently shipped a carload of honey.

The box shock shortage has been largely overcome and now citrus shippers are faced with a car shortage.

The flood crest of the Colorado River has passed and Palo Verde and Imperial Valley farmers are breathing easier.

W. L. Churchill is the new manager to take charge of affairs of the Lima Bean Growers Association at Oxnard.

Twelve extra train crews were required daily to handle cantaloupes out of Imperial Valley during the height of the season.

Ventura County bean growers report injury to the bean crop by the hot wave was not as severe as first anticipated.

The sugar factory at Oxnard, Ventura County, is installing equipment for conversion of the wastes of the factory into potash.

Apple and melon men are investigating advisability of branding each individual fruit by using a new electrical branding machine.

Riverside County alfalfa growers recently met and discussed plans of stabilizing the market and securing fair return to members.

The San Bernardino Valley Producers Association has received \$25,000 for potatoes sold this season. They are receiving around \$3.75.

The Coachella Valley Date Growers Association is discussing methods of extermination of the scale of date trees, also the matter of marketing of dates.

While the scale pest has been hit by the hot wave investigators are urging continuance of the fight against the pest to accomplish almost complete eradication.

A water storage project calling for the investment of approximately \$2,000,000 is contemplated for San Dimas Canyon, Los Angeles County. It will create a lake covering 500 acres.

Because of pre-cooling demands and general volume of business the creamery at Brawley, Imperial County, will increase its capital from \$75,000 to \$250,000, to be invested largely in refrigerating equipment.

## Butter and Cheese Scoring Contest

By H. S. Baird

WENTY-ONE cubes of butter and 16 cheese were entered in the third scoring of the 1917 Educational Butter and Cheese Scoring Contest held at Modesto. Four buttermakers and four cheese makers were present for the scoring. This part of the contest seems to be growing and we hope that even more interest will be taken by the butter and cheese makers in the future.

Hans Beck of the Danish Creamery, Fresno, received the highest score on butter with 94½. High scores on cheese were as follows: Cheddar; John Reber of Bieber, Arthur Schoenrock of Galt and Ray Weedmark of the University Farm tied with a score of 92; California (Granular): Ray Weedmark, University Farm 93; Jack: Chas. Basciarini, Columbia Dairy, Woodland and Rufus Steele, Swanton tied with a score of 92½.

The scoring was done by T. J. Harris, official inspector of the San Francisco Wholesale Dairy Produce Exchange, H. S. Baird and S. L. Denning of the Dairy Division. The following is a list of the scores:

### Butter

Ed Hooper, Spreckels Market Creamery, San Francisco, 93¾;

G. G. Plunkett, Exeter Creamery Company, Exeter, 93;

F. H. Strieby, University Farm, Davis, 93;

Harvey R. Smith, Exeter Creamery Association, Porterville, 92½;

J. T. Hague, McCloud Dairy, McCloud, 92¼.

**Summer Defects Prominent in Butter**  
S. L. Denning, who was one of the judges, makes the following comment on the butter:

"The butter entered showed the effect of the recent hot weather both in flavor and body. Some of the entries were criticised for an old, unclean flavor indicating that the cream was not of the best quality. Some of the cubes contained a neutralizer flavor. During the summer months it is a problem, especially in the hot valleys, to handle the cream so as to make a fair quality product. Several of the buttermakers have indicated that they are churning at night. Where the cream is hauled on routes and arrives at the creamery in the afternoon or evening it is undoubtedly better to churn at night because the sooner the cream is churned the better the butter will be. Even if the cream is pasteurized it should be churned as soon as possible and not held over night. The body in a large percentage of the entries was leaky and greasy. Several were also weak. These defects are very often caused by the butter warming up while working.

The average score of the 21 cubes was 92.25. Although this is a lower average than for the last two scorings it is a very satisfactory showing for this time of the year. There were no

scores below 90 and 66 per cent of the entries scoring 92 or better.

The composition scores will not be as high as they should be. The average percentage of moisture was 14.2 and the average percentage of salt was 2.3. The moisture varied from 13.0 to 15.9 per cent and the salt from 1.2 to 3.3 per cent. If this is representative of the daily makes some butter makers are losing money for the creameries. If, however, the low percentages of moisture are due to special churning those buttermakers are missing the intended benefits of the contest.

The color was very uniform throughout all the entries. The boxes were also very uniform in size and appearance."

### Cheese Not Uniform

The average score of all cheese entered was 90.97. The following is a report on the different classes, given in the order of average score, average moisture and average fat.

Cheddar, 91.6, 37.6, 29.8;

California (Granular), 91.1, 39.96, 29.66;

Jack, 90.2, 43.38, 22.5.

The common criticisms on the flavor of the cheddar cheese were "bitter" and "sour." These flavors are, no doubt, caused largely by a poor quality of milk. A few cheddars were criticised for being open and others for being dry and crumbly. High acid milk will cause the latter defect. The criticisms on the flavor of the California (Granular) cheese were much the same as those on the cheddar. The body and texture of several of the cheese of this class were criticised for being dry and rubbery. The "eyes" which are characteristic of this cheese were lacking, most of the cheese being "close" and "heavy." It is quite probable that four-fifths of the defects in the two types of cheese mentioned above were caused by high acid and unclean milk.

The jack cheese lacked greatly in uniformity, the only similarity of any two cheese being the shape. This seems to be a fair representation of the jack cheese reaching the market according to the reports of the buyers. The moisture content of the cheese varied from 39.4 to 49.4 per cent. Some of the flavors were very unclean indicating that the milk used was of a very poor grade. In order to make a good jack cheese the milk used must be fully as good as milk used for the other types of cheese. It seems to be the opinion of some that "half skim" jack cheese can be made from almost any quality of milk because the cheese is to be dried. Unclean flavors will not be lost in drying, and it will be fully as objectionable when the cheese reaches the consumer as unclean flavors in the softer types of cheese.

The next scoring will be held in connection with the State Fair at Sacramento, September 8th to 15th.

## Raising Young Kids

Written for California Cultivator By Martha W. Howland

GET the best results from a young kid by giving its mother's or another doe's milk, warm and living, newly drawn from the udder, either by allowing it to nurse or by means of a baby's bottle. If the bottle method is adopted five feeds a day

are necessary at first, beginning with the first milk, or colostrum, about five ounces at a feed, and gradually increasing the amount and decreasing the number of feeds per day till at four months the kid is taking nearly a quart at a feed and being fed three times a day, morning, noon and evening.

Warranted to Give Satisfaction.

**HOLSTEIN  
CATTLE**

To the open minded farmer or dairyman, the  
results of actual comparative tests of Holsteins  
with other breeds are striking object lessons of  
economic investment. The ten largest records of  
Holstein cows average 1,007 pounds of butterfat  
and 25,897 pounds of milk in a year. A like  
number of cows of the nearest competitive breed  
produced 974 pounds of butterfat, and 18,120  
pounds of milk. One good Holstein cow will pro-  
duce as much as two ordinary cows at a saving  
in feed and care. There's big money in the  
big "Black and White" Holsteins.

C. L. HUGHES, Sales Mgr., SACRAMENTO, CAL.  
Col. Ben A. Rhoades, Auctioneer, Los Angeles

If the kid is allowed to remain with  
its dam, and she is a good mother,  
she will regulate its feedings herself,  
but if she prove an indifferent one the  
caretaker should hold the doe at stat-  
ed times, and let the kid get a full  
meal. This is the exception to the  
rule as nearly all goats are good moth-  
ers. When the kid begins to chew its  
cud then other food should be acces-  
sible, good alfalfa hay to nibble at, or,  
better still, freshly cut "filaree," sup-  
plemented with about two ounces of  
rolled barley at first and gradually in-  
creasing until at four months it is re-  
ceiving one-half pint per day. After  
a year old give all the alfalfa hay it  
will eat and one pint of rolled barley

per day, preferably given in two feeds,  
night and morning. The milk should  
be given as previously stated, up to  
five months of age, then gradually  
stopped.

Keep kids in a big, shady corral with  
a jumping platform or bench in the  
center so they can play and exercise  
at will. Never keep one alone. If  
there is no other doe, then keep two  
kids together.

There is no other satisfactory sub-  
stitute, although cow's milk, sweet and  
pure, can be used. If this is not avail-  
able I would use condensed milk in  
preference to these prepared meals  
that are on the market.

**A Great Holstein Sire Comes to  
California**

One of the most important improve-  
ments ever made in the Holstein  
blood in California comes through the  
purchase of the great sire, King of  
the Black and Whites, by Henderson  
Company, Sacramento. While the pur-  
chase price has not been made public,  
it was undoubtedly the longest price  
ever paid for a bull of any age or

King of the Black and Whites now  
has 20 A. R. O. daughters, several  
with records above 20 pounds butter  
in seven days as 2 year olds, and has  
a large number of daughters, yet to  
freshen with first calf in a number of  
good herds. He will be given a large  
opportunity in the splendid herd of  
over 300 head that Henderson Com-

**HOLDER OF THREE STATE  
RECORDS**

Stanislaus Princess Cleopatra, 239-  
986, owned by A. J. Stalder, and as  
senior three-year-old holder of three  
state records. She started her test

breed by a California breeder, for  
King of the Black and Whites is in-  
sured for \$30,000.

King of the Black and Whites ranks  
as one of the top-notch young sires of  
the breed, unexcelled in the uniform  
high production of his female ances-  
tors, and carries a combination of  
what is probably the greatest proven  
transmitting blood of the breed. He  
was bred by A. A. Hartshorn of New  
York, formerly president of the Hol-  
stein-Friesian Association of America,  
a man who has devoted the greater  
part of his life to a herd of registered  
Holsteins that today has no equal in  
all the world in respect to number of  
families with consecutive generations  
of cows with official records above 30  
pounds butter in seven days.

King of the Black and Whites was  
the first bull of the breed whose seven  
nearest dams averaged over 30 pounds  
butter in seven days, and the records  
of all seven of these dams are re-  
markably uniform in high milk flow  
and a most desirable average percent-  
age of butter fat. Six of the seven  
nearest dams have records above 30  
pounds of butter in seven days, and  
the average for the whole seven is  
574.9 pounds milk, 31.04 pounds butter  
in seven days, average per cent of  
butter fat 4.31.

May 12, 1917, and made a seven-day  
record of 513.9 pounds of milk, 31.04  
pounds butter. Her milk tested 4.83.  
Her 14-day record was 996 pounds  
milk, 59.29 pounds butter. Thirty-day  
record 2198.7 pounds milk, 119.7  
pounds butter. Average test 4.35.

pany already has, and the benefit that  
the dairy industry of California will  
derive through the bringing of this  
great young sire to the state can hard-  
ly be overestimated.

**CHANGE IN JERSEY REGISTRA-  
TION FEE**

The American Jersey Cattle Club  
has revised its schedule of registra-  
tion fees. It now stands as follows:

Females one year old or under, to  
members, \$1.00 each; to non-mem-  
bers, \$2.00.

Females over one year old and not  
more than two—To members, \$2.00  
each; to non-members, \$3.00 each.

Females over two years old—To  
members or non-members, \$10.00  
each.

Males one year old or under—To  
members, \$2.00 each; to non-members,  
\$3.00 each.

Males over one year old and not  
more than two—To members, \$3.00  
each; to non-members, \$5.00 each.

Males over two years old—To mem-  
bers or non-members, \$10.00 each.

**DAIRY CATTLE CONGRESS**

The Dairy Cattle Congress will be  
held at Waterloo, Iowa, October 1-7.  
There will be addresses on dairy sub-  
jects and an exhibition of dairy cat-  
tle, dairy equipment and creamery  
supplies.

**CUTTER'S  
BLACKLEG PILLS**

"California's Favorite"  
for nearly 20 years

For the Prevention of Blackleg  
in calves and young cattle

Their superiority is due to near-  
ly 20 years of specializing in  
"Vaccines and Serums only."

Year in and Year Out they give  
better satisfaction than any  
other vaccine made, and the  
cost of a few cents per dose  
is cheap insurance against a  
disease that always takes the  
fattest and best.

Single Pills may be used for or-  
dinary and range stock.

Double Pills should be used for  
pure bred and high grade stock.

Use any Injector, but Cutter's  
simplest and strongest.

**Prices:**

10 dose pkge. Single pills \$1.00  
50 dose pkge. Single pills 4.00  
10 dose pkge. Double Pills 1.50  
50 dose pkge. Double Pills 6.00  
Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtain-  
able, order direct.

Write for new booklet, "The  
Control of Blackleg." It tells  
about Anti-Blackleg Serum  
which cures Blackleg and  
may be used simultaneously  
with vaccine to combat out-  
breaks and safely protect val-  
uable stock.

**CUTS LABOR IN HALF**

Do you first disinfect, and then go over  
all surfaces again with whitewash in  
order to keep your stables, dairies  
and poultry houses bright, cheerful and  
free of lice, mites, fly eggs and the germs of  
roup, white diarrhea, cholera, glanders, etc?  
Such a method is a waste of time, money and  
labor. Use Carbola instead—it does the two things  
at the same time. It is a disinfectant that dries  
out white—not dark and colorless—and gives much  
better results.

**CARBOLA**  
The Disinfecting White Paint

Carbola is a mineral pigment combined with a  
germicide twenty times stronger than pure car-  
bolic acid. Comes in powder form, ready to use  
as soon as mixed with water. Applied with brush  
or sprayer. Will not clog sprayer. Will not flake,  
blister or peel off nor spoil by standing. No dis-  
agreeable odor. Absolutely safe—will not harm  
stock if they lick surfaces painted with Carbola.

If your dealer does not carry Carbola, send his  
name with order and we will ship direct.

10 lbs. (10 gals.) \$1 and postage. 20 lbs. 20 (gals.)

## Field Notes From the Live Stock Men

Gotshall and Magruder have assembled a herd of registered Holsteins on their farm at Ripon that is bound to be heard from. Their state record, 27 pound, two-year-old daughter of King of the Pontiacs shows promise of great production as she matures, and there are some royally bred heifers in the herd that are bound to make good.

The senior herd sire is a grandson of King of the Pontiacs, being sired by King Pontiac Netherland Segis, whose dam is a daughter of King Segis Pontiac. His dam is a 31-pound four-year-old daughter of Sir Skylark Ormsby Hengerveld and this combination of blood promises much in this sire.

King's Valet, the grand old Jersey sire in the N. H. Locke Company herd at Lockeford, is today a remarkable example of vigor in an aged sire. Although nearing his fifteenth birthday he is straight of back, bright of eye and quick as a two-year-old. In the Locke herd he has a splendid lot of daughters. These have for years been consistent winners on the show circuit in the younger classes and they have developed into wonderfully deep bodied cows with uniformly good top lines and probably the best average lot of udders of the daughters of any one Jersey sire in the state.

King of the Black and Whites arrived safely at Henderson Company's Ranch, Sacramento, after his long trip from New York. He received the most enthusiastic reception ever accorded a bull on arrival in California. A crowd estimated at no less than five hundred persons visited him at his new home.

These are busy days on the big 1200 acre ranch at Galt, that is now the home of Willowmead herd of registered Holsteins owned by James McGillivray. A vast amount of development work is being done to make this one of the biggest and best Holstein breeding establishments in America.

J. W. Benoit has fortified against shortage of feed for his registered Holsteins on his farm at Modesto. A cement stave silo was recently erected and partially filled with barley cut in the milk. The Holsteins in the herd rank it one of the leading herds of Stanislaus County, many of the cows having good A. R. O. records. There is an especially promising lot of well grown heifers of good type coming on and they will be given an opportunity to show their producing quality in A. R. O. work.

The Third Sacramento Consignment Sale of registered Holstein cattle will be held at State Fair Grounds on October 25-26. Some consignments of high class cattle are promised from prominent herds, and nothing will be left undone to make this the greatest offering yet made at Sacramento.

Succulent forage should be provided for throughout the year. Do not expect the pig to live on this alone, as many farmers do. After the pig has been weaned do not turn him out to root hog or die. Feed him some barley and tankage each day; he will put on more flesh and bring you more profit than if he was turned out into a field of 80, 100 or more acres. After he has the bone and frame, give him all he will eat. Don't be afraid to cut the string on a sack of barley.

A pig should at the end of 30 days weigh 15 pounds. During the second month it should gain about one-half pound daily; during the third month it should gain seven-tenths of a pound

daily and during the fourth nine-tenths pound daily. These gains can be increased if the sow is a good suckler and the feeder an experienced man. At five months it should be put on full feed and kept gaining from one to two pounds daily thereafter till ready for the market. Hogs fed in this way will reach maturity quicker and of more uniform size.

In selecting foods digestibility as well as bulk should be considered. The measure of the feeding value of any material is not so much the amount of protein, carbohydrates and fat it contains as the amount which the animal is able to get out of it.

## Veterinary

Unsigned communications receive no attention.

### Caked Udder

I have a cow which has a hard caked udder. She will be fresh in several weeks.—Subscriber, Mecca.

Caked udder that comes sometime before calving is not so serious as when there is a large flow of milk. Rub the udder with the hands and milk her out clean twice a day. Also mix three pounds of epsom salts, two pounds of common salt and two ounces of powdered nux vomica and give her a handful in the feed once a day. Feed green or sloppy feed and see that she gets plenty of good drinking water. You should be able to get the swelling all out before calving.

### Rubbing Tail

I have a fine, six-year-old horse that rubs the hair all off the top of the tail. Did the same last summer but did not during the winter and the hair grew out again. Otherwise he is in good health.—Subscriber, Fresno.

It may be caused by pin worms in the rectum or by eczema in the skin. For pin worms inject two gallons of tobacco tea made by pouring boiling water on about four ounces of scrap tobacco. Repeat this in about a week. Allow the tea to cool before injecting it.

For eczema scrub the parts clean once with soap and warm water and then once a day wet the parts with chloride of zinc solution using one dram to the pint of water. Tie the horse so he can not reach any place to rub the tail because when the habit is once acquired he will continue to rub after the irritation is stopped. In a short time he will forget it.

## Milch Goat Production Cost

For several years the New York agricultural experiment station (Geneva) maintained a herd of milch goats, and in Bulletin No. 429 announces the results of its studies upon these animals. The milk was used in many cases of poor nutrition of babies and infants, in almost every instance with good results and with remarkable benefit for some of the patients. It is for such use that the station recommends the keeping of goats, for as a source of milk for ordinary consumption only the very best producing does, which are uncommon, can be compared with cows for economy.

As the goats do not suffer from tuberculosis one source of danger to

infants is avoided, and the milk seems to be assimilated by many babies whose systems reject cows' milk or find it a source of trouble.

The bulletin gives a detailed statement of the feed cost of the goat milk but it was found impossible to calculate accurately the other sources of expense. The average food cost of the milk produced by the herd in three years was 3.4 cents a quart, while the Jersey herd of the station during the same period produced milk at a food cost of 0.2 cent a quart. The best doe in her best year produced milk at a cost of 1.72 cents a quart for food.

The bulletin, like all issued by the station, will be sent free on request.

## Shorthorn Expansion

For more than a century and a quarter Shorthorns have had an active identity with the progress of agriculture in America. The breed is today the most popular and most widely disseminated in the United States of any bovine breed. Yet if all of the registered Shorthorns now living in this country were assembled in the state of Iowa there would be an average of less than two to each quarter section in the Hawkeye state.

During a few weeks' period in the late winter of 1917 over 500 Shorthorn bulls were sold in a limited territory in Central Illinois—a suggestion

of the inclination of corn belt farmers to rely upon this time-tried breed for the improvement of their cattle stocks.

During the years 1915, 1916 and so far in 1917 there has come up from the South, where cotton raising has long been the almost exclusive farming industry, a call for Shorthorn breeding stock, unprecedented in its extent. Many hundreds of Shorthorns have been shipped to the cotton states to satisfy this demand. The Shorthorn is favored because its dual-purpose characteristics and its adaptability to the prevailing conditions in that latitude are generally recognized.

## Ration for Work Horse

The Illinois Experiment Station says:

"The ration for a horse of a pound of grain and a pound of hay per hundredweight per day is a useful standard. The horse doing light work may receive more hay and less grain, and the horse at severe labor should receive approximately the above amount of hay and enough grain to keep him in condition.

"For the past seven years our work horses and mules at the station have been fed for the most part legume hay. Their grain ration has been either ear corn or ear corn two-thirds and oats one-third. These ra-

tions have been entirely satisfactory for feeding mature geldings and mules.

"It is essential to feed a good quality of legume hay. For our work horses we prefer a rather stemmy alfalfa hay to the more leafy, pea-green sort. The latter proves too washy. When one feeds all or as much as one-half legume hay to the classes of workers mentioned, it is ordinarily not necessary or economical to feed a protein concentrate. In feeding hay we like to feed one-half of the total daily feed at night, the balance being evenly divided between the morning and noon feeds."

## Keep Pigs Growing

Keep the pigs growing. It is the pig's business to develop a good frame, to grow bone, muscle, and vital organs, and to lay on fat. Plenty of pasture, some grain, exercise, and good sanitary quarters are all necessary if the pig is to be thrifty and profitable. They should be kept on pasture as long as possible and gain the benefit of its cheap nutrients, especially mineral and protein, and its tonic and digestive qualities. But pigs on pasture alone, even alfalfa, need some grain supplement. The amount of grain or other concentrated feed used would depend on how much pasturage is available, on the cost factor of grain or other feeds, on the age and condition of the pigs, and the time at which the farmer expects to market them.

Less protein supplement is needed when pigs are run on leguminous pastures. Under most farm conditions the pigs will gain well on a 1 to 2 per cent grain ration. The self-feeding method makes for cheap and rapid gains. If the grain ration is limited, the hand-feeding method is better.

By feeding once a day in the early evening, pigs take greater advantage of the pasture and graze hungrily during the cool of the morning or afternoon. Plenty of fresh, clean drinking water always should be available.

Pigs on pasture usually get enough exercise. A concrete wallow will add to the pigs' comfort, and a layer of oil on the water will keep down lice. Clean bedding also helps to keep away lice, as will an oiled sack on a rubbing post, or sprinkling the pigs with crude oil every two weeks.

To supply mineral matter and a tonic, the following mineral mixture is good. It always should be accessible. Dissolve the copperas in hot water and sprinkle over the mixture.

Copperas, 2 pounds; Sulphur, 4 pounds; slaked lime, 4 pounds; salt, 8 pounds; wood ashes, 1 bushel; fine charcoal, 1 bushel.

—U. S. D. A.

### LAZY JOY

Among the few great joys of life is staying in bed fifteen minutes after we know we ought to get up.

## We will Reward You With This Great Book

Everybody can have a copy under our liberal offer. Send for yours today.

### Greatest Book on Feeding.

"Feeds and Feeding", by Henry and Morrison, is the recognized standard authority on the feeding of dairy cows, beef cattle, calves, hogs, horses and sheep. The authors at great expense and with much time and labor, have compiled the most important findings of the investigators of both the Old World and the New in the science of animal nutrition, together with the vast number of feeding trials, conducted in California and the experiment stations of other states, the whole being rounded out by the practical experiments of many of the leading stockmen of America.

### Latest Edition.

This is the latest edition containing the new chapter "Economy in Feeding Live Stock" and much other information recently found by investigators in this and other countries.

701 PAGES—Cloth bound and full of Valuable Information

## How to Get Best Results Feeding California Barley

"Feeds and Feeding" is a large volume, 701 pages in substantial cloth binding, clearly printed in large type and written in plain, understandable language. It is intensely interesting throughout and represents the sum total of hundreds of experiments, trials, and record tests on practically every feeding combination ever attempted and the personal experiences of the authors and many other noted feeding experts from California to Maine.

Full and complete information is given in regard to the feeding and feed value of California Barley, how to obtain the best results, and giving the results of many barley feeding tests. (Pages 162, 308, 309, 360, 414, 454, 525, 530.)

## We Are Going to Give These Books Away

### READ OUR OFFER TO YOU

If you would know feeds, their value, what to feed, and how, get this neat book that thoroughly covers the subject. With the information it gives at your command, you can cut many dollars from your feeding cost.

### Only takes a Little Time.

You can obtain one of these valuable books at no expense—just a few minutes' easy work. To any reader of California Cultivator who will secure for us only three new yearly subscriptions to California Cultivator at \$1.00 each—the regular subscription price, we will send a copy of the latest edition of "Feeds and Feeding" by Henry and Morrison. If you want to buy this book it will cost you \$2.25 anywhere. You know California Cultivator and how much valuable information you get from its columns each issue. You receive the best thought and experiences of many of the West's most authoritative writers. The results of many tests and experiments and the live stock, dairy and agricultural news of what is going on over the entire Pacific Coast at a cost of only \$1.00 per year. Your neighbor, if he is not already a subscriber, will be glad to have you show him a copy. You can get three new subscribers at \$1.00 each quickly and easily. Send us the \$3.00 and the subscribers' names and addresses and we will send the book to you postpaid. You may include your own subscription by paying a full year in advance of this date and including two new subscriptions at \$1.00 each. There must be at least two new subscriptions for one year.

Address all orders to

CALIFORNIA CULTIVATOR, 115-117 N. Broadway, Los Angeles

## Prize Winning HAMPSHIRE

The farmer who wants a hog that puts on 200 lbs. of firm meat at six and a half months of age buys the Hampshire.

Boars, gilts, bred and open, for sale from the P.P.I.E. Champion Hampshire stock, just as nearly perfect as they make them.

Perkins, Cal.

# Weaning the Chicks

Written for California Cultivator By Jean A. Koethen

**A**T ABOUT the age of six weeks, varying somewhat in different breeds and under different management, comes the time in the chick's life when it is ready to do without other warmth than that of its own body. It has already learned to eat, to fight for its own rights, to seek shelter from the sun and protection from the cold. If it happens to be a hen-brooded chick, it may be the happy recipient of mother's care for some weeks longer; on the other hand, it may have been thrown on the mercies of a cold world some weeks earlier. If it is a brooder chick it has certainly learned to shift for itself as far as possible. There is now but one more lesson to learn, the trick of roosting.

Chicks differ greatly in the readiness with which they take to the roost. Some begin to practice roosting very young, and will hop on any box edge that presents itself, while others, more timid, perhaps, of the same age and breed, will crouch on the ground under their roosts long after the majority of the flock are exercising their inherent right and privilege. It is best not to force any to roost until they are quite ready.

The device most generally used for teaching chicks to roost is a sort of floor made of lath or thin slats about the width of lath nailed to strips of wood an inch thick. Such a floor as this is placed in the bottom of the weaning coop or under the roosts of the house which is to be the future home of the chicks. As soon as they have learned to keep their balance on these strips they are ready to find their places on the roosts.

For the small number of chicks I raise in a season I do not bother with these slatted bottoms,—not that I do not approve of them, but I have found an easier way. As my chicks are usually hen brooded, and there are not often more than two broods of the same age, there are rarely more than 20 chicks to be weaned at once. These are placed in what I call a brooder box, which is merely a clean apple or potato or cracker box. If the chicks are not over a month old, as sometimes happens, when the hen leaves them, they are given a box high enough to permit of a door being cut in one side. The bottom is covered with straw and the top covered with an old quilt or blanket. In chilly weather there is no better covering than an old wool sweater with a burlap sack over it, the sweater being so arranged that it rests on the chicks' backs. The door is left open to provide ventilation. If the chicks are fully ready to roost they need no

cover, and therefore no door in the box. They are lifted in for a few nights and then know perfectly where to go to bed. This brooder box is placed on the ground under the roosts of the small colony coop which is to be the home of the pullets till they go to the laying house and of the cockerels till they are ready for the fattening pen. The chicks continue to go to bed in the box for several weeks, but gradually one after another is found at night on the side of the box or on the roost above it, and before they know that they are learning to roost every one is roosting. This may be a lazy woman's way of teaching chicks to roost, but it is more comfortable for the chicks than struggling to keep their balance on the slatted platforms. The boxes are

easily cleaned with the hose, and as soon as they are no longer needed for the chicks are chopped up for kindling.

In order to get the best results these weaning coops—or colony coops, if they are to be the permanent home of the chicks,—should be on clean, green range. A hopper of mash and a crock of water, with sprouted grain for breakfast and mixed hard grain for supper, a fruit tree here and there to provide shade in the middle of the day, frequent sprayings or paintings to keep the coops free from insect enemies, and your chicks are literally "in clover." Nothing to do but grow, and everything to keep them growing. We make ourselves a deal of trouble when we confine our growing chicks to bare, dry yards.

## Egg Laying Contest

**S**TORRS, Conn., report for the thirty-fourth week ending June 26, 1917. The Rocks, Wyandottes and Leghorns all made a bid for weekly honors. By the small margin of one egg F. M. Peasley's Leghorns from Cheshire, Connecticut, got first place with a yield of 60 eggs. A Hartford pen of Buff Wyandottes entered by Cloyes & Sullivan, and A. P. Robinson's White Leghorns from Calverton, N. Y., tied for second place with 59 eggs each. The total yield for all pens amounted to 4290, which is 160 less than for the preceding week but 140 more than for the corresponding week last year.

There is, of course, a point beyond which hens cannot go in laying eggs. Without much question the zenith of production has been reached. Large numbers of the heavier breeds have been broody, and this always means at least a temporary interruption in the egg yield. Furthermore some individuals that have been slackers all along will soon be shedding their feathers, and molting nearly always means no eggs. Thus the poultryman's problem is not so much how to get more eggs this week than he did last but rather to recognize the fact that hens will yield less eggs from this time on to the end of the laying season. Good care and management during the summer means that the

falling off in yield should take place gradually instead of abruptly.

The subjoined table indicates the best week's production during each of the past four years. It shows also the time at which this high water mark was reached and the percent yield from the one thousand hens under consideration.

Year	1914	1915	1916	1917
No. Eggs....	4490	4244	4724	4510
Wk. Endg. Apr. 24	May 9	May 14	Jn 12	
Per cent yield	64.1	60.6	67.5	64.4

The three best pens in each of the principal varieties are as follows:

### Barred Plymouth Rocks

Fairfields Poultry Farms, 1425; Merritt M. Clark, 1210; Michigan Poultry Farm, 1155.

### White Wyandottes

Merrythought Farm, 1311; Obed G. Knight, 1166; Joseph Moreau, 1145.

### Rhode Island Reds

Allan's Hard to Beat Reds, 1336; Geo. W. Harris, 1254; Hillview Poultry Farm, 1245.

### White Leghorns

A. P. Robinson, 1498; J. O. LeFevre, 1358; Hilltop Poultry Yards, 1352.

### Miscellaneous

Cloyes & Sullivan, (Buff Wyandottes), 1246; Holliston Hill P. Farm (White Rocks), 1207; Obed G. Knight, (White Orpingtons), 1199.

## Grass Clippings for the Poultry Flock

Grass clippings are an excellent green feed for chickens. The backyard poultry flock of a family often lacks sufficient green feed with a consequent reduction of egg and meat production. With the easy availability of lawn clippings the city poultryman can always have green feed through the summer for his chickens. The flock can be fed daily as much of the green clippings as they will

eat. If any continued bowel trouble shows the amount should be reduced. The remainder of the clippings can be allowed to dry and fed moistened during the time between lawn cuttings.

Amounts in excess can be dried for winter. They can be dried and stored in sacks. These dried clippings, moistened and fed to the flock, are a very fair substitute for the succulent green feeds of summer.

## Wetting Spoils 5,016,000 Dozen Eggs

Approximately 5,016,000 dozen eggs spoil needlessly every year in cold storage simply because some one has let clean eggs get wet or has washed dirty eggs before sending them to market, according to the specialists of the United States department of agriculture. Careful investigations of large quantities of stored eggs show that from 17 to 22 per cent of washed eggs become worthless in storage, whereas only four to eight per cent of dirty eggs stored unwashed spoil. The explanation is simple. Water removes from the shell of the egg a

gelatinous covering which helps to keep air and germs out of the inside of the egg. Once this covering is removed by washing or rain which gets to eggs in the nest, germs and molds find ready access to the contents and spoil the eggs.

### ALL PERVASIVE

The teacher's last question was meant to be a scientific poser.

"What is that which pervades all space," she said, "which no wall or door or other substance can shut out?"

No one had an answer ready but Freddy Sharpe.

"The smell of onions, miss," he said, promptly.—New York Times.

### DAVENPORT'S Riding Bean Harvester

Don't wait a minute to harvest your valuable bean crop when you can get our Two Row Riding Bean Harvester. No more satisfactory harvester made. Strongly braced, well constructed with 2 long steel blades. Cuts and windrows two rows at a time. All indications are that there will be a 25 to 30 per cent shortage in bean harvesters due to shortage in materials. Order now.

Farming tools, span of horses, harness, wagon, some household furniture, fine climate. Priced for quick sale \$1300. No trades. W. W. Baldy, Raymond, Madera Co., Cal.**

**For Sale or Lease**—1000 acres bean land, \$75 per acre; on Santa Fe R. R. within 6 miles of ocean, near new government cantonment and within 100 miles of Los Angeles. Might divide or lease to responsible parties for beans. Plenty of water. Address for appointment, Owner, 1236 Citizens Bank Building, Los Angeles.

**Twenty Acre Ranch** for rent on Mission Acre Tract. Good new buildings. Best of soil. Will rent for term of years to right party. Also ten acres without buildings, one mile west of Van Nuys. W. C. Planalp, San Fernando, Cal.

**Oregon, California Government Lands.** Latest, Green Booklet Free. Tells "How, Why, Where." Write Joseph Clark, Sacramento.

### PATENT ATTORNEYS

Patents that protect are secured through the PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "PATENTS"

### MONEY TO LOAN

**Money to Loan**—On improved farms, city property or for building loans, also on cattle or cotton crops. C. G. Paul, 206 North Glendale Ave., Tropic, Cal.

### HOGS

**Chester Whites, the Billiken Brand**—Bred sows and gilts. Every rancher should carry at least one good brood sow; are you going to help out our future meat supply? I have the following to offer, first class in every respect and priced low: 2 young tested sows to farrow in July; 6 spring gilts to farrow in September; 13 fall gilts to farrow in October. Weaned pigs, both sexes, to be delivered during the month of June; 4 young boars ready for service. Write for prices and circulars. C. B. Cunningham, Mills, Cal.

**Grape-Wild Farm Berkshires**—World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

**For Sale**—2 registered Big Type Poland China gilts of the famous Whitten Ranch stock, nine months old, just ready to breed. Only reason for selling, owner at Officers' Reserve Corps, Presidio. For further information address Mrs. A. G. Bohannon, 2036 Oak St., South Pasadena, Cal.

**Large Yorkshires**—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

**Superba, World's Grand Champion Poland-China** boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

**Rancho Rubio Durocs.** Only a few September gilts left. One corking good fall boar by Orion Model, son of the last International grand champion. Place your orders now for weaned boar pigs. Best I ever raised. Elmer Lamb, Ceres, Cal.

**Wanted**—Farmers, orchardists, livestockmen to use classified liner advertisements like this. Thousands of people read every ad and the cost is only 3 cents per word per issue, minimum 35 cents. Extra lines of white space above and below cost only 16 cents per line.

**Large Type Poland-Chinas.** Have ready for shipment three spring yearling boars, three fall pigs, spring pigs both sexes. Sired by Glenn Chief, a 1000-lb. boar, and out of prize winning sows. Cremer-Erikson & Co., Orland.

**Big Type Durocs.** Well grown out February and March pigs of either sex in any quantity. We ship only the tops and butcher the culls. F. M. Johnson, Napa, Cal.

**Cholera Immune Duroc-Jerseys.** Big type. Weaned boars and gilts from 500 to 700-pound sows. Prize winning stock. Derryfield Farm, I.O.O.F. Temple, Sacramento.

**Duroc Jerseys**—Southern California, the Duroc center of the west. For the best Durocs, see Peters, Lamson & Walker, Devore, San Bernardino, Cal.

**Crawshaw's California Chinas** are profitable and profitable. Weanlings \$15.00, boars \$25.00. Dr. J. A. Crawshaw, Hanford, Cal.

**Poland-China Swine Recorded.** Stock for sale at all times. We please you or refund your money. W. A. Young, Lodi, Cal.

**Most Money in Duroc-Jerseys.** Bred sows and weanlings, either sex all the time. Delta Farm and Live Stock Co., Colton, Cal.

**Choice Boar Pigs for Sale.** Sired by Superba 220620, champion Poland boar at San Francisco. Prices right. C. R. Hanna, Riverside, Cal.

**Large Yorkshires**—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Callotoga, Cal.

**Normandy Farms** herd of Berkshires are now to be found at A-1 Ranch. Write for catalogue. Arlington M. Smith, Visalia, Cal.

**One Large and two medium type boars,** extra choice, 9 and 10 months old. W. Bernstein Ranch, L. C. Trewhitt, Mgr., Hanford, Cal.

**Model Herd Berkshires** bred for size and quality. Weanlings and gilts. J. L. Gish, Laws, Calif.

**Carruthers' Farm Berkshire Hogs.** Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal. Berkshires—Two hundred pounds at six months. Ray C. Hannan, Corning, Cal.

**Poland-Chinas**—A few good breeding boars. S. F. Williams, Orland, Cal.

### HORTICULTURAL PRINTING

**Catalogues**—Good Printing. Specialists in preparing nursery, seed, poultry and live stock catalogues and all kinds of commercial printing. For prices and information address WOLFER PRINTING CO., 115 No. Broadway, Los Angeles.

### RABBITS

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

### Attaching Mortgaged Property

A holds note signed by B and wife; B fails to pay. Can A attach the mortgaged property of B?

If it is real property it may be attached and sold under execution on the judgment obtained subject to the lien of the mortgage. If it is personal property with a chattel mortgage thereon the holder of the chattel mortgage may require his mortgage to be first paid off on notice of the attachment.

### CONSERVING ENERGY

"De man dat talks de loudest," said Uncle Eben, "generally lets his voice keep workin' while his mind rests."—Washington Star

Never would have been need of a "swat the fly" campaign if Noah had swatted the couple which walked up the gang plank of the ark.

When a man can talk on only one subject he soon lacks opportunities to talk at all.

Our farm adviser says: Don't plant tea in coffee grounds.

### CANNING RECIPES

"The National Steam Pressure Canning Outfits" is the title of a catalog or booklet relating to home canning outfits. A most valuable feature of this booklet is the fund of recipes given in the last 33 pages. We believe that copies of this will be sent to those interested in home canning by the Berger and Carter Company, 17th and Mississippi Street, San Francisco.

### HOME CANNING

"Home Canning by the Cold Pack Method" is the title of the remarkably fine booklet published by the International Harvester Company, Harvester Building, Chicago. It has a fund of information regarding canning, the use of the home canner, and even disposal of canned products.

## Can Your Own Foods

Economize! Save Your Surplus.

Let nothing go to waste—but put up your fruits, meats, vegetables and fish in sanitary tin cans. Turn them into money or enjoy them yourself.

Use the Burpee Home Can-Sealer. Adopted by canning clubs all over the country because of its simplicity and the fact that no solder nor acid are needed. Seals cans airtight. Every machine guaranteed. Cans secured from our distributing stations. Recipe book with every machine. Write for free literature now.

## OLD LAVENDER

My mother had a hedge  
Of ancient lavender  
Down at the garden's edge  
With yellow bees astir.

She used to clip the bloom  
And spread it out to dry  
Up in her sunny room,  
Under the gables high.

Of some, the stalks and all,  
A thick brew she made,  
And put in bottles tall,  
For country pain and ache.

Then purple sprig and green,  
She laid within the drawers,  
The towels, the sheets between,  
And my starched pinafores.

Great bundles, too, she set,  
All in the closets hoar.  
I think I smell it yet,  
The Sunday gown she wore!

And pillowed safe and deep,  
How sweet the little bed,  
Where I lay down to sleep,  
After my prayer was said!  
—Lizette Woodworth Reese

## POVERTY VS. LOVE

**S**HE finished the page of the big ledger and sat looking down at it with the satisfaction that always comes after a piece of work has been accomplished with faultless effect. Clearly, she worked because she loved to.

The sunshine of the afternoon came in through the window, beyond which, almost on a level with herself, the usual Saturday crowd was moving. The sounds of many voices in varied keys and the shuffle of leather soles made languid assertion to her loneliness in the big, still office.

Suddenly one footfall detached itself from the rest. Her back was toward him as he entered, but she turned instantly, responding to his greeting with a nod and a remote little smile.

He glanced toward the empty chair at the other desk. "Hawley's not in, I see?"

"He is out of town till tomorrow." "Ah, yes!" He drew a deep breath and appeared to ponder, while she waited with her distant air of courtesy, yet in reality almost painfully conscious of him in every detail—the set of his broad shoulders, the curve of his chin, the way his hair grew at his temples.

"I wanted to see Hawley," he said. "But it doesn't matter. Another day will do as well. Good afternoon!"

He went out quickly and she turned back to her ledger with exceeding heaviness of heart. A moment she kept her head up, then it went down upon the page, while her fingers pressed the tears back into her hot eyes.

He had come again and gone without giving her a word. His mission had been merely to see Hawley.

As Hawley's friend she had come to know him. At first he had always stopped at her desk for a bit of chat. Twice he had walked home with her. Once he had brought her a book upon which they had passed judgment in a moment's conversation.

She knew all about him from Hawley—how brilliant he was and how poor, because he maintained that a lawyer should keep his calling as pure as a priest should keep his.

She could not tell when she had first become impressed by his change of attitude toward her. At first she had blamed herself for it, so went was she to hold men at a distance, but gradually she was forced to un-

derstand. Her pride helped her then and she had met him with coldness equal to his own. So they had moved apart. Yet why? What had caused it all?

She was still trying to reason it out, her head on the ledger, when the big clock struck the close of her working day. She rose, locked her desk and set forth for home.

The streets were quiet as she walked rapidly to the old house in a fashionable quarter of the town, where she lived with an old cousin who had once been wealthy. It was a fine house, finely appointed, as befitted the taste of a gentlewoman.

A maid admitted her, and she went up to her room; spacious and handsome with old furniture, old lace at the windows, an old rug on the floor.

In a large closet hung a row of dresses for indoor wear. She selected one deliberately and put it on—a cream silk of rough foreign weave, simply made. It was the custom of this house for its occupants always to dress for dinner.

The picture the long cheval glass showed to her when she had finished dressing set Esther to wondering how other business women managed who had only their salaries to depend upon. Surely there would be no putting on of silk frocks for them when their day's work was over, no dining from the daintiest limoges, no sleeping afterward in a mahogany four-poster.

She felt a fresh sense of gratitude to her father for having left her so much money that she need work only enough to ease her loneliness and afterward play the lady in any style she chose.

Until a few months ago her work and the ability to surround herself with every luxurious accessory necessary to the happiness of a woman of modern culture, had sufficed her for happiness. She had believed herself the most carefree woman living. Now, however, all was changed. Since Arthur Hale came into her life and was withdrawing from it apparently of his own accord she had learned what actual heartache was.

Cousin Hannah, faded of face and raiment, yet in both distinctly the aristocrat, was waiting at the dining room door as she came down to give her a kiss and a letter. Esther did not receive many letters and this one aroused in her a faint feeling of surprise.

She tore it open, warned of its importance even before she scanned the typewritten page. It was from Michelson, her father's former partner, the man in whose care he had left her money. Fear smote Esther as she read. Quickly she crossed to the table and sat down in her place, her face as pale as the verbenas in the tiny cutglass vase at her plate.

"What is it?" Cousin Hannah was leaning over her. She lifted her eyes.

"I don't know. I cannot seem to understand. But I don't like the tone of this letter. I'm afraid I have been foolish to trust Mr. Michelson so long even though father wished it. If only Mr. Hawley were at home! But there is Mr. Hale! I must consult someone. Cousin Hannah, while I am gone to 'phone to him, see what you can make out of this letter."

She gave it to the older woman and left the room.

"He is coming at once," she said when she returned. "Did you read the letter, Cousin Hannah?"

The older woman looked troubled.

## The Cultivator Patterns

8410—Children's Dress. Cut in sizes 2, 4, 6 and 8 years. The dress is in one piece.

8426—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. Long or short sleeves may be used.

8163—Ladies' Overblouse. Cut in sizes 34 to 44 inches bust measure. This overblouse is made to slip on over the head.

8434—Ladies' Dress. Cut in sizes 36 to 44 inches bust measure. Sleeves may be long or short and the skirt has three gores.

8419—Ladies' Apron. Cut in sizes 36, 40 and 44 inches bust measure. The apron is cut in one piece and is to be slipped on over the head.

8417—Boys' Russian Suit. Cut in sizes 2, 4 and 6 years. The blouse closes at the right side of the front and the pattern provides for straight trousers.

8152—Ladies' Skirt. Cut in sizes 24 to 34 inches waist measure. The skirt is cut in four gores.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

**California Cultivator**  
Los Angeles

"I'm afraid—" she began, helplessly.

"I'm afraid, too," Esther said. "O, Cousin Hannah, I never realized until this moment how much my money means to me."

Within an hour Hale was there. Esther met him in the dim old drawing room alone, and they talked earnestly together. When he had read the letter she saw that he was even less hopeful that she had been.

"Something should be done at once," he said. "If you will trust me—" A look from Esther's eyes answered him.

During the weeks that followed he and Hawley together fought with might and main to save for Esther a remnant of her fortune. But the day came when she knew that their com-

"No," Esther answered, wondering.

"Your money. I loved you, but I was too proud — after Hawley told me—"

"O," cried Esther, radiant and enlightened, "that, then, was the obstacle. But we shall be poor now, Arthur—"

"Poor in everything save love," he whispered, happily.—Ex.

**MORE ABOUT CANNING TOMATOES AND SQUASH**

Written for California Cultivator  
By Mrs. E. C. Hawley, El Cajon

**I** AM certainly surprised at the number of requests I have had for recipes because of my letter in the Cultivator of May 19. I am glad to

range oven and in that way avoid the careful watching and stirring necessary when pumpkin is cooked over the blaze.

Also I always cook such things as pumpkins or fruit butters in the oven on days when fire has to be kept and the top of the stove is full of other things. When the pumpkin is cooked tender I put it through a fruit press or potato ricer, returning it to the oven and cooking till it is like butter, then I fill the jars and seal and it is splendid and always ready for pies and puddings and is fine warmed in the oven with salt, pepper and butter added.

My "pet economy," which I would like to recommend to every farmer's wife, is a dandy pet sow. My "Mary Jane" was one year old May 19, 1917,

and she, with her family of six pigs (five weeks old), has lived and grown on just what would otherwise be total waste. And pigs are just splendid pets—cleaner and better than pups any time.

**HOUSEHOLD QUERIES**

**Hominy**

Please give recipe for making hominy.—Subscriber, Manhattan Beach.

Here are two methods:

Three cups hardwood ashes, two quarts cold water, two quarts dry corn. Put ashes into water and boil 30 minutes. Leave until the ashes settle to the bottom. Pour off the clear water, which should feel slippery. Add corn to this water and boil until the hulls begin to come off. Drain and wash the corn in cold water, rubbing

**HELP SAVE NEEDED FOOD!  
GET BEHIND HOOVER!**

**THE FOOD PLEDGE OF CALIFORNIA WOMEN.**

I am glad to join in the exercise of food conservation for our nation and hereby accept membership in the United States Food Administration, pledging myself to carry out the directions and advice of the Food Administration in the control of my household.

Name .....

Street .....

City .....

Occupation of breadwinner .....

Number in household .....

Do you employ a cook? .....

Have you a garden?..... (Fruit?)..... (Vegetables?).....

Will you take part in authorized neighborhood movements? .....

**HOW YOU CAN HELP SAVE**

First—To save the wheat:

One wheatless meal a day, using cornbread or other cereal as a substitute.

Second—To save the meat:

One meatless day a week.

Buy less and serve smaller portions.

Third—To save butter fats:

To use no butter in cooking. Three times the necessary fats are consumed in cooking.

Fourth—To save transportation:

By eating home products and so release freight cars for other uses than transportation of food.

Fifth—To preach "The Gospel of the clean plate."

To buy less foodstuffs.

To skimp the garbage can.

Sixth—To increase the use of corn, buckwheat, rice, rye and of all vegetables.

Aside from eating an increased proportion of these commodities in order to save on wheat, meat and butter fats, to preserve and store any surplus for winter use.

Pursuant to the national movement for food conservation, Herbert C. Hoover, head of the United States Food Administration Commission, is calling upon every patriotic California family to aid in saving foodstuffs.

If you wish to join with hundreds of thousands of loyal Americans in helping to win the war, cut out the above pledge, fill it in and mail it to the state council of defense at Sacramento. Then live up faithfully to the promises you have made—and get others to do so.

binéd efforts had been vain after all. Her money was gone and with it the clever rogue to whose keeping it had been intrusted.

That evening Esther was sadly turning over her few valuables wondering what best she could dispose of, when the maid came to tell her that Mr. Hale was waiting in the drawing room to see her.

During the stress of the past weeks though they had met often and talked together at length, their acquaintance had made no advance in friendliness. She wondered a little as she went down stairs why he had called to see her when there was no apparent need. As she entered the room he met her with hand outstretched.

"Esther," he began suddenly. Then, as she turned startled at the expression of his voice and face, his arm closed about her. The next instant she was against his shoulder, joyfully conscious that she was his and he hers forever.

"You understand, dear," he said, presently, "that this would have happened long ago but for one thing. Can you guess what that was?"

pass on any information I may have that others will profit by, but I am a very busy woman and it is really impossible to answer each of these letters. Hoping that you will help me, I am sending you the recipes most asked for.

**Canning Tomatoes**

Scald and peel tomatoes, let stand several hours till water forms, more than enough to cook. Add one teaspoon salt to six quarts tomatoes, skim carefully while cooking, have jars ready and fill boiling hot, seal and test.

Many people seem to find it difficult to keep tomatoes or strawberries in glass. There will be no trouble if they are kept in a dark room or wrapped in paper and packed in boxes.

**Canning Squash and Pumpkin**

Squash or pumpkin can usually be kept nearly all winter just stored in a cool, dry place. But when canned either squash or pumpkin needs to be cooked 10 to 12 hours. I use a large granite dishpan which fits into my

thoroughly with the hands to remove the hulls. Wash until there is no taste of the lye. Put into clear water and boil several hours until tender. Reheat in pork fat or serve hot with a thin white sauce.

One quart yellow corn, one teaspoon baking soda, plenty of water. Wash the corn several times. Put it in a kettle with the soda and cover with water two or three inches above the corn. Bring to a boil and stir often. Then cover and let simmer two hours or longer. Drain off the water and rinse thoroughly. Cover again with water, and with the kettle cover, and again bring to a boil. Set it back, tightly covered, after salting to taste, and let it cook four hours or more, when it is ready to dish up and eat with milk or cream as a cereal or with pork fat or butter as a vegetable.

### REDUCE DISEASE

Here are fifteen rules for more scientific habits of daily living which Professor Fisher of Yale University, proposes as a means of keeping people well and happy, and lengthening their lives:

1. Ventilate every room you occupy, and keep the air in the house always as pure as the air outdoors.
2. Wear light, loose clothes of porous cloth, so loosely woven that air can be blown through it, for the skin needs air.
3. Spend some time in the open air every day.

4. Have lots of fresh air where you sleep, or sleep out if you can.

5. Breathe deeply.

6. Avoid eating too much.

7. Do not eat too much meat and eggs.

8. Eat various kinds of food—most people eat too soft food. Hard foods like crusts, toast, hard fruits, and nuts, which require chewing, are beneficial. The danger with most people is that they eat too much of concentrated foods and not enough of the bulky or filling foods, such as lettuce, celery, cucumbers, spinach, asparagus, cabbage, cauliflower beets, onions, carrots, parsnips, squash, pumpkins, tomatoes, and other garden vegetables. Some raw foods, such as fruits and salads, should be eaten each day, as these raw foods contain certain beneficial elements which are often lost in cooking.

9. Eat slowly.

10. Have your bowels move at least once each day—preferably twice—

11. Stand, sit, and walk erect.

12. Avoid poisonous drugs.

13. Keep clean and avoid contagious diseases. The daily bath is desirable. The hands should always be washed before eating. Water should be boiled before drinking if its purity has not been established. Mosquitoes and flies should be kept out of the house and away from food. Fruits—especially apples—after a meal are good mouth and tooth cleaners.

14. Work hard, but play, sleep, and rest too. Laughter is healthful.

15. Be cheerful, and learn not to worry.

"The secret of life and of happiness," says Professor Fisher, "seems to be in taking one's life and work cheerfully. Almost anyone can assume this attitude if the proper desire is present."

If your neighbor has found a better way of doing farm work you ought to know it. He is probably anxious to give you the benefit of his experience, but unless you desire it he is not likely to force it on you.

### SAVE SUGAR IN JELLY MAKING

Much waste of sugar and spoilage of jellies can be avoided by using a simple alcohol test recommended by the bureau of chemistry, United States department of agriculture. To determine how much sugar should be used with each kind of juice put a spoonful of juice in a glass and add to it one spoonful of 95 per cent grain alcohol, mixed by shaking the glass gently. Pour slowly from the glass, noting how the pectin—the substance in fruits which makes them jelly—is precipitated. If the pectin is precipitated as one lump, a cup of sugar may be used for each cup of juice; if in several lumps the proportion of sugar must be reduced to approximately three-fourths the amount of juice. If the pectin is not in lumps, but is merely precipitated, the sugar should be one-half or less of the

amount of the juice. If the juice shows no precipitation under this test it is unsuitable for jelly making and must be combined with apples or other juices rich in pectin.

The housewife will do well before making the test to taste the juice, as fruits not as acid as good tart apples probably will not make good jelly unless mixed with other fruits which are acid.

The erring woman is as much entitled to mercy as is the erring man. Men and women who lead clean and upright lives are under no social, moral or religious obligation to make unclean men and women their associates, unless such men and women show decidedly that they have reformed. When they have reformed we should encourage and help them along the same as if they had never offended.

COOK  
WITH  
PEARL  
OIL

## LESS WORK

No coal, wood or ashes to lug. No waiting for the fire to burn up.

Meals in a jiffy and a cool kitchen all the time. Bakes, broils, roasts, toasts. Better cooking because of the steady, evenly-distributed heat.

More convenient than a wood or coal stove for all the year 'round cooking, and more economical.

The long blue chimneys prevent all smoke and smell.

In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

HAY

Under date of July 7, Scott, Magner  
& Miller say:  
Receipts for the week 1520 tons. Last  
week 1997 tons. Falling off in receipts  
principally caused by extreme heat that  
has prevailed throughout the interior dur-  
ing the week. Purchasing throughout the  
country has only been done in a small  
way. Fancy wheat in light bales has  
been scarce and the few arrivals of this  
grade have been sold at top quotations.  
Alfalfa is in light supply with the demand  
likewise. Straw is practically nominal as  
the new crop has not started to arrive  
and the old crop is cleaned up. Prices  
quoted below are on new hay only.  
We quote today wholesale prices in  
carload lots as appear from dealers'  
transfers upon the market. For prices to  
consumers charges of cartage, com-  
mission and handling expenses must be  
added.

Citrus Fruit Market

LOS ANGELES, July 11, 1917.

The market has taken readily every of-  
fering of good quality fruits. Prices are  
holding very satisfactorily and every in-  
dication is favorable to a successful Na-  
vencia season. While the end of the Na-  
vel shipping season occurred some weeks  
ago there are lingering offerings in the  
auctions, which are commanding prices  
but little above St. Mikes and Seedlings.  
As the season progresses the injury to  
Valencias from the heat is much less than  
anticipated.  
Lemon prices are good and will remain  
so.

Shipments  
Shipments of oranges from Southern  
California since November 1, 1916, 32,840  
cars; lemons, 6247; total, 39,087; to same  
date last season, oranges, 25,597; lemons,  
5009; total, 30,606. From Central Califor-  
nia to date this season, oranges, 4832;  
lemons, 164; total, 4996; to same date last  
season, oranges, 5393; lemons, 146; total,  
5539. From Northern California to date  
this season, oranges, 845 cars; to same  
date last season, oranges, 610, lemons, 1.

HOSPITALITY

We seem to see the passing of that  
delightful phase of the old-time fam-  
ily life called hospitality. One charm  
of hospitality is that it dares to be  
spontaneous, even haphazard. Some  
one is picked up and brought home to  
dinner; or called by telephone Sunday  
night and urged to come for supper;  
or the neighbors are summoned by  
message that the wood fire is just at  
the stage for popping corn. The per-  
son who is afraid to be unconventional  
will never taste the sweetest joys of  
hospitality. Where true hospitality  
exists, every one is at ease and there-  
fore at his best.

One formidable obstacle in the way  
of exercising hospitality arises from a  
false notion that things are necessary;  
things to eat, things to look at—car-  
pets, furniture, silver, glass. Hospital-  
ity not only does not depend upon  
these things, but it is something far  
removed from them. Indeed, its fin-  
est flavor is often found amid the  
plainest surroundings.—Women's In-  
stitute Quarterly.

## The Weight of War

The heavy hand of war has disturbed the balance between supply and demand the world over. Our problem of serving the public has all at once assumed a new and weightier aspect.

Extraordinary demands on telephone service by the Government have been made and are being met. Equipment must be provided for the great training camps, the coast-defense stations must be linked together by means of communication, and the facilities perfected to put the Government in touch with the entire country at a moment's notice.

In planning for additions to the plant of the Bell System for 1917, one hundred and thirty millions of dollars were apportioned. This

is by far the largest program ever undertaken.

But the cost of raw materials has doubled in a year. Adequate supplies of copper, lead, wire, steel and other essentials of new equipment are becoming harder to get at any price, for the demands of war must be met.

Under the pressure of business incident to the war, the telephone-using public must co-operate in order that our new plans to meet the extraordinary growth in telephone stations and traffic may be made adequate.

The elimination of unnecessary telephone calls is a patriotic duty just as is the elimination of all waste at such a time. Your Government must have a "clear talk track."

## The New Oliver Nine

Was \$100  
Now \$49

## A TYPEWRITER REVOLUTION

New Machines for Half the Former Price

At the very height of its success, The Oliver Typewriter Company again upsets the typewriter industry. Just as it did in 1896, when it introduced visible writing and forced all others to follow. Now this powerful Company—world wide in influence—calls a halt to old expensive ways of selling typewriters. It frees buyers of a wasteful burden.

A company strong enough, large enough and brave enough to do a big, startling thing like this, deserves a hearing.

The full facts are set forth in our amazing exposure, entitled "The High Cost of Typewriters—The Reason and The Remedy." One copy will be mailed to you if you send us the coupon below.

being your own salesman. And we gain economies for ourselves, too. So it isn't philanthropy. Just the new, efficient way of doing business to meet present-day economic changes.

Note this fact carefully. We offer the identical Oliver Nine—the latest model—brand new, for \$49, the exact one which was \$100 until March 1st.

### HOW WE DO IT

Henceforth The Oliver Typewriter Company will maintain no expensive sales force of 15,000 salesmen and agents. Henceforth it will pay no high rents in 50 cities. There will be no idle stocks.

You, Mr. User, will deal direct now with the actual manufacturer. No middlemen—no useless tolls. We end the waste and give you the savings. You get the \$51 by

### THE LATEST MODEL

Do not confuse this offer of The Oliver Typewriter Company itself of a brand new latest model 9 with offers of second hand or rebuilt machines.

This is the first time in history that a new, standard \$100 typewriter has been offered for \$49. We do not offer a substitute model, cheaper, different or rebuilt.

Read all the secret facts in our document, entitled "The High Cost of Typewriters—The Reason and The Remedy." The coupon below mailed today will bring you one copy.

## SAVE \$51

This Oliver Nine is a twenty-year development. It is the finest, costliest, most successful typewriter we ever built. It is yours for 10 cents per day in monthly payments of \$3.00. Everyone can own a typewriter now. Will any sane person ever again pay \$100 for a standard typewriter when the Standard Visible Oliver Nine sells for \$49?

Send today for your copy of our book and further details. You'll be surprised.

MAIL  
TODAY

## FREE TRIAL

No Money Down—No C. O. D.  
After you read our book you may ask for an Oliver for five days free trial. Be your own salesman. Save yourself \$51. You decide in the privacy of your own office or home, as you use the Oliver. Then if you want to own an Oliver you may pay at the rate of 10 cents per day.  
Mail the coupon now for "The High Cost of Typewriters—The Reason and The Remedy." It rips off the mask. Cut the coupon out now.

## Of Interest to Citrus Fruit Growers

### Fumigation versus Spraying

Professor Frederick Maskew, Chief Deputy Quarantine Officer under the State Commission of Horticulture (now connected with the University of California) at present located at San Francisco, formerly collaborating with Professor R. S. Woglum in connection with fumigation investigations, SAID BEFORE THE 47TH CALIFORNIA FRUIT GROWERS' CONVENTION the following:

"With this wealth of experience on both sides of the question from which to draw; with a full knowledge of the fact that in the three great undertakings (experiments on a large scale to control insects by spraying) recited, spraying was abandoned for fumigation, with a clear comprehension of the many factors that make for success or failure in the employment of either method, and from the general average of results obtained, I state to you without hesitation that were I the possessor of a citrus orchard and it became necessary to disinfect the same for scale insects I should employ fumigation for that purpose, and also officially advise all those who consulted me upon this matter to do likewise.

Spraying is the contact method, and unless the contact is made results do not ensue. A tree is sprayed when it is wet all over both sides of all the leaves, twigs and branches. With an evergreen tree this is practically impossible unless at a prohibitive price due to waste of both material and time. With the most perfect of equipment success in spraying is largely a matter of the personal equation. With a perfect equipment the personal equation is almost entirely eliminated by mechanical action in modern fumigation, and last but not least in my mind is the fact that the instant a tent is removed from a tree any future deleterious effect to plant life is eliminated by the immediate dissipation of the gas. On the contrary, undue accumulations of spray material sometimes occur and remain after the operation, resulting in more or less injury to plant tissues."

It is an established fact that groves are **BETTER AND MORE EFFICIENTLY** treated for **SCALE CONTROL** by **FUMIGATION**. Painstaking growers have satisfied themselves that the cost of fumigation is less than the cost of spraying. Furthermore, **ONE FUMIGATION PER SEASON DOES THE WORK EFFECTIVELY, IMPROVING THE CONDITION OF THE TREES**, while several sprayings are necessary and the **RESULTS ARE INCOMPLETE KILLING OF SCALE WITH GENERALLY SERIOUS DAMAGE TO FRUIT AND TREES**.

The results of **SURVEYS** and **EXHAUSTIVE INSPECTIONS** made in citrus groves covering several thousand acres, in the counties of San Bernardino, Riverside, Orange and Los Angeles, show that **FUMIGATION EFFICIENCY** stands at 99.5 per cent. The average efficiency for spraying operations shows less than 45 per cent, with serious damage to fruit and trees.

**CYANEGG** will, this year, be available for the full needs of the citrus fruit growers. There is no need for growers to resort to the more expensive and less efficient spraying. Everyone owning a grove should fumigate.

Interested parties desiring additional information may obtain same by addressing,

## Cow Testing Associations in Arizona

M. E. Bemis Writes for Cultivator Readers of the Beginnings of Cow Testing in One of the Newest Agricultural Sections of the Country. See Cover Illustration, Which Depicts Method of Handling Things in the Pioneer Way

**P**REPARATORY School for County Agricultural Agents—that is what the two first cow-testing associations of Arizona have developed into.

For a number of years dairying in the irrigated valleys of the state, and particularly in the Salt River Valley, has increased very rapidly. The luxurious growth of alfalfa and the mild climate have made dairying profitable. The rapid increase in numbers of dairy farmers has had too its disadvantages. Chief of these was the ease of disposing of the unprofitable cows.

It is a fine thing to sell the unprofitable cow to the butcher. There are comparatively few dairymen anywhere who will deliberately sell their neighbors a cow which has proved unprofitable, but they ease their consciences and help out their pocket-books if they make a public sale and sell out their herd. If it should chance that some of the cows were dry at the time of the sale and so not offered, and if it should also chance that those same cows were the best of the herd, who can say? The buyer at an auction sale knows that he takes a chance, and except for minor guarantees such as future dates of freshening, there is little probability of a come-back.

The temptation to unload in this way is all too strong and has resulted in the frequent transfer from one farm to another of the unprofitable

cow when she should have gone to the butcher. Possibly this migration of the unprofitable cow had something to do with the tardiness of the dairymen of the Salt River Valley in forming cow testing associations. Sporadic attempts to form associations fell

go to the small bother and expense incidental to joining a cow testing association.

The live stock division of the state agricultural extension found it difficult to interest the dairymen of the valley, although there were at the

tremely capable young men, both having just completed with honors a four year course at the state agricultural college. Watson Pickrell was placed in charge of the "Arizona Pioneer Cow Testing Association" and George Scheerer was the guiding spirit of the "Madison-Scottsdale Association."

These young men had much to contend with. The selection of the name of the first association was more or less of an inspiration as there was much pioneering to be done. The work was new; there was no other association of the kind in the state; and it was difficult to hold the interest of the members; there was always the tendency to sell out, more or less characteristic of a new country, and as a matter of fact several herds were sold. The dairy farmers were often too busy to transport the testers from one farm to another, and this made it inconvenient to the testers and annoying to the dairymen. There were a number of tenant dairy farmers whose courage flagged, and it needed diplomacy to keep their interest up. Green feed was short through the winter and the dairymen without silos—and but few did have them—found their cows shrinking in milk flow, and no way to prevent it. This was unfair to the cows and discouraging to the owners.

Then too the man who began to

Continued on Page 66

Testers of Two Cow Testing Associations in Arizona

Taken in front of the chamber of commerce at Phoenix. Both of these testers have now been advanced to county agent work.

through because there was lack of sufficient interest. The individual dairyman in some instances weighed the milk of each cow daily and either tested the milk or had the creamery which he patronized test it for him, but by far the greater majority of the dairymen were making a good fair profit and were apparently willing to drift along, and few seemed willing to

time some 50,000 head of dairy cattle, and it was only after much talking that two associations were formed, one in the west end of the valley and one in the east end of what is commonly known as the "North Side." Fortunately in each association there were some of the best dairy farmers of the community, and still more fortunately the testers were both ex-

## Time to Eradicate Scale Pests

Heat Accomplished Much and Thorough Fumigation Will Now Leave Citrus Orchards Comparatively Scale Free

**T**HE heat has killed the scale." "The freeze of 1913 killed the scale."

Every abnormal condition does kill untold numbers of these pestiferous insects, and for this reason the grower has now and then a bit of leeway, or opportunity to get another running start. But not often is the miracle of extermination performed. The citrus grower who knew the conditions of California citrus orchards 25 years ago when they were dripping with honey dew and slimy with billions of white scale well recalls the miracle which was performed by the vedalla and may be justified in hoping that when such a day comes as was given us in June and takes the fruit from the trees that it has also completely eliminated the scale.

Examination showed that very young scale which were susceptible to the heat of that day were killed. Now comes the more careful observer and says that we are not justified in being too optimistic. Every adult scale has wonderful reproductive power and is wise in that the next generation is not all brought forth at the same time. The young which has

been hatching since the early spring days probably all yielded to the heat, but the eggs which are now hatching are producing youngsters which must be controlled. The more observing of the fruit growers are not countermanding orders for fumigation supplies because they now see that the opportunity of a lifetime is here. These young scale, without the early maturing youngsters which become to a degree resistant to fumigation, may now be caught at a time of their life when they are easily destroyed. So growers, horticultural inspectors and commissioners are uniting in the slogan; "Hit 'em now and hit 'em hard."

At first it was announced that some orders for cyanide had been countermanded. We now learn that some of these countermanding orders have been countermanded. Notwithstanding cyanide is higher, sulphuric acid likewise, and labor hard to secure, the trees must be put into best condition to give a great crop for 1919. This they cannot do if they are supporting scale meantime. The growers have the money. The past year has been an exceptionally favorable one; the crop has been the largest ever, and the prices have been satisfactory, not at

times, but the entire year through. To be sure, some growers have not yet recovered from the cold of 1913, and now the crop has been greatly reduced for the coming year. But cultivation must be continued; irrigation also is necessary. It is probable that fertilization will yield big returns. With the other necessary upkeep fumigation must also be considered. We say "fumigation," for as a rule citrus orchardists have found better results in the handling of all scale pests by treating with hydrocyanic acid gas.

This process has been used in citrus orchards for nearly 30 years. It will be used in much the same way the coming year that it has for the past three or four years. Some will continue the manufacture of the gas under the tent after it is placed over the tree, in vessels, the same as has been done from the beginning. More will use the improved fumigation machinery. This process has the advantage of instantaneous production of gas and more uniform killing in all parts of the tent; also the saving in chemicals and in time makes it very economical, so that the expense of the application is no greater than un-

der the old and less satisfactory process.

As to how best results may be secured there are various answers. The more popular, or at least the more common, method is for each grower to contract with one who makes it his business to fumigate. Under the new county horticultural commissioner act fumigators or sprayers are now licensed by the county commissioner and the license may be revoked in case of unsatisfactory performance on the part of the contractor. Presumably best of results will be given by these men whose license depends upon their work.

The equipment and skilled labor required makes fumigation by the small grower impossible, and cooperation has been called into action. Some of the most successful fumigation, and at lowest cost, has been carried on by these cooperative organizations. These are sometimes entirely independent, and again connected with fruit growers' organizations which are able to secure supplies in large quantities at lowest possible cost.

It does appear that this is a year when the most effective work in many years may be secured.

# Save Your Crops

WITH A  
**SAMSON SIEVE-GRIP**  
TRACTOR

Full, steady power gets your silage cut, grain separated and other farm work done with least loss and cost to you.

Direct drive from motor to belt-pulley—not a gear in motion—means no waste of power or wear of gears.

Easy to place in position and to attach pulley and belt.

Use a Samson Sieve-Grip for your harvesting and then for your fall plowing. Let us tell you more about it.

## Intercropping of Orchards as Related to the Present Emergency

By R. S. Vaile, Citrus Experiment Station, Riverside

**T**HERE is a peculiar interest in orchard intercropping this season. Two factors are of primary importance in this interest: namely, first, the desire to produce more actual food supplies during the present war emergency, which carries with it, of course, the sharing in the high prices of such food supplies; and second, the light crop of oranges which is the result of the extremely hot weather in the middle of June. These two factors operate along somewhat different lines because the first one has made its appeal primarily to the owners of young non-bearing groves, while the second one affects directly the owners of bearing groves from which an income was expected this season.

The intercropping of young orchards has been carried much farther in Southern California this year than normally, and while it is too early to tell the result of this increased practice, the indications at present are that it will be successful from an economic standpoint. In all probability it is a thing to be encouraged in the future.

The question of intercropping orchards of bearing age, on the other hand, is one which has frequently been dismissed as unprofitable financially, and unsound agriculturally for Southern California conditions. This conclusion in the past has been based upon the factors of high water cost, low yield of the intercrop because of shade, and interference with the best development of the orchard crop. This year, the latter factor is somewhat removed because there is no fruit crop set upon the trees in many individual instances. Also there is a financial consideration which makes it apparently timely to reopen the entire question of the desirability of intercropping mature orchards.

In considering this question three points in relation to the orchard itself must be borne in mind: namely, the fact that the condition of the tree in the fall has a great deal to do with the setting of the next spring's crop; the fact that all fertilizing materials are to be extremely expensive next spring, and some of them entirely off the market; the fact that irrigation systems and intervals of irrigation are adjusted to take care of the trees and may not be satisfactory for maintaining both the trees and the intercrops. Because of the first two points it seems highly desirable that a particularly good winter cover crop be raised for plowing under next spring. It is usually deemed advisable to plant Melilotus clover or vetch for this purpose about the middle of September. Under the present conditions it may be permissible to delay this planting date for a month or even six weeks. In this case the most rapid growing crop should be used. The Broad Windsor or Horse bean appears to be better adapted to late planting than other commonly used legumes. It is the opinion of the writer and of many leading growers with whom this problem has been discussed that the fertilizing value of a leguminous cover crop during the winter will more than equal the cash value of any other crop which might be grown at this time.

It is possible to raise winter peas for harvest and at the same time have the advantage of a winter legume

cover crop, the straw from which may be turned under. In case such peas are to be raised for consumption as green peas, the high labor cost of picking is frequently a prohibiting factor. In case they are designed for canning the drawback is found in the fact that Southern California canneries are not now equipped for commercial threshing of peas. It is possible that these disadvantages could be overcome in certain cases, but they should be carefully considered before planting winter peas as intercrops with the idea of harvesting.

There are comparatively few crops that can be successfully raised between the present time and the time of planting winter cover crops. These might include Indian corn, Hubbard squash, Sudan grass, fall potatoes and certain truck crops. Of these none would give very high cash returns from the amount of land available between the trees. Potatoes would be impossible except where arrangements could be made for irrigating at least once every two weeks. Truck crops would doubtless be the most profitable per acre, but they require a peculiar type of specialized agriculture, and it is doubtful if anyone, except a few scattering individuals who have had previous experience, could expect to be successful with them.

As a result of conferences with numerous experienced growers the experiment station feels that a word of warning should be sounded regarding attempts to intercrop orchards of bearing age. This is not a time to experiment with untried crops and processes. There are certain individuals who know without being told what they can raise at this time of year; they will in large measure be successful; they should receive every encouragement and their example should be carefully noted; but unless a man is familiar with the crop that should be grown and has had experience in its culture it is doubtful if he will get paid for his seed, extra water, and labor. It would seem better economy to raise all of the fertilizing material possible in the orchard, thus reducing the expense of the fertilizer bill next spring. In this connection, a crop of cow peas planted immediately will make considerable tonnage for disking under within 60 to 75 days. A crop for harvesting could not be matured in that time, however. Following the disking down of such material, a crop of horse beans, which is the most rapid grower of our winter cover crops, could be planted to give a good tonnage by the latter part of February. This policy may well be encouraged wherever an extra irrigation is possible two or three weeks following the planting of the cow peas.

For those growers who are in absolute need of a cash income during the coming year some of the crops mentioned above may prove valuable. There is opportunity for a limited number to enter the poultry or rabbit industries in conjunction with the orchards. All of the green feed and a part of the grain can be grown and the manure will be of benefit to the orchard. Doubtless after everything that can be successfully done in the orchards is actually under operation, there will be many who will have to find their income from outside sources such as the leasing of other lands or the use of teams and labor in other lines of work.

# Ant Poison

Written for California Cultivator

**T**HE ant is a strange creature of the insect world, or perhaps it would be more correct to say that all other insects are strange, for the ant is quite human in many of its habits. The story of its maintaining a "dairy" of aphids and destroying other insects which may prey upon the aphids is well known. This habit is becoming a matter of serious consideration with citrus growers. Close observation has developed the fact that the Argentine and other ants are destroying parasites or predaceous insects which have been introduced to control the citrus mealy bug, hence to give these parasites an opportunity to work on the mealy bug and save the orchards, a study at the Southern California insectary and by Prof. R. S. Woglum of the United States department of agriculture is being made. One of Prof. Woglum's suggestions is that an ant poison be distributed about the citrus trees and in this way control secured of the pest. A special poison is recommended by the department: It is: U. S. D. A. formula.—Fifteen pounds sugar, 7½ pints water, ¼ ounce tartaric acid; boil 30 minutes and cool. Three-quarters ounce sodium arsenite dissolved in ½ pint of hot water; cool. Mix together and add 1½ pounds honey. The method of distribution is novel and effective. Ordinary small paper sacks, say about the one-pound size, are first dipped in paraffine, then holes are punched around the entire sack some distance above the bottom, and a small quantity—say a teaspoon or more—of the above poison is placed in the sack. Prof. Woodworth has recommended that it be used with a sponge, but this is more expensive and County Horticultural Commissioner Wood of Los Angeles reports that he has found fully as effective results where the poison is poured or smeared over the inside of the bottom of the sack. The paraffine prevents soaking and destruction of the sacks.

The above formula does the work. Wherever used it has not only kept the ants from the tree but seems to cause the death of the entire colony; at least they disappear. The method of placing the poison in the tree has been to close the mouth of the bag, make one or two folds in the top and

tack to the side of the tree. Prof. Woodworth's formula for poison is somewhat simpler, the mixing of arsenic in sugar syrup. Regarding the ant, we quote the following from the monthly bulletin of the state horticultural commission for June.

The Argentine ant is, as its name indicates, a native of Argentina and is also common in Brazil. It was supposedly introduced on coffee ships into New Orleans, and was first noticed there in 1891. It also occurs in South Africa and Chile. In the United States at the present time it is found in a number of the Gulf states, as well as in California. Professor Woodworth gives its occurrence in this state as follows: Alameda, Azusa, Berkeley, Byron Hot Springs, Campbell, Claremont, College Park, Corona, Cupertino, Emeryville, Fruitvale, Los Angeles, Martinez, Melrose, Monrovia, Montecito, Oakland, Piedmont, Riverside, San Francisco, San Jose, Santa Clara, Stege, Stockton and Upland. During the past season we found it in several places in Sacramento.

The ant itself is a small, dark brown insect, and is practically without odor when crushed. There are three forms: the worker, the queen and the male. The queen is about twice as large as the worker and somewhat differently shaped, the abdomen being comparatively larger. The male is slightly larger than the worker and has a much larger thorax and smaller abdomen in comparison. Both of the true sexes are winged, although the wings of the queen are shed after a short time.

The ant nests in large colonies, either in the ground or in the crotches of trees, or in practically any protected place. A nest will contain from one to a large number of queens, the duty of which is to lay the eggs from which the colony develops. These are deposited at the rate of as high as 50 per queen per day, and are immediately removed by the workers and placed in localities in the nest where conditions are most satisfactory for their development. As soon as the eggs hatch the larvae are cared for by the workers and fed with sweet substances, which they collect by foraging. This food consists mostly of the honey-dew secreted by aphids and scale insects.

# The County Horticultural Commissioner Law

By Horticultural Commissioner Geo. H. Hecke Before Commissioners  
Convention at Modesto

**T**HIS LAW creates the office of county horticultural commissioner, provides for his appointment and removal and defines his duties.

The state board of horticultural examiners is created, consisting of the state commissioner of horticulture, the dean of the college of agriculture of the University of California and the superintendent of the state insectary. This board passes upon the eligibility of candidates for county horticultural commissioner by means of examinations, and from the list of eligibles so determined upon the county board of supervisors must appoint a commissioner for the term of four years. The expense of this office is borne by the county. A county horticultural commissioner may be dis-

qualified by the board of horticultural examiners after a public hearing of charges against him, and when so disqualified the supervisors must remove him from office.

It is the duty of the county horticultural commissioner to inspect any orchards, packing houses or other premises within his jurisdiction, and if found infested or infected with injurious insect or animal pests, plant diseases, or noxious weeds to notify the owner or person in charge to eradicate or control the same to the satisfaction of the county horticultural commissioner within a specified time. If the owner or person in charge does not abate the nuisance within the specified time it is the duty of the county horticultural commissioner to cause it to be abated, the expense thereof

# A Special Plow for California Orchards

Plowing conditions in California orchards demand special plow construction. A serviceable plow must stand the severe strains occasioned by the soil conditions and operate close to the orchard trees.

## John Deere California Orchard Tractor Disc Plow

meets these conditions admirably. Heavy lap-beam frame—laps securely joined by heavy bolts — no sagging — discs always in alignment.

Discs best quality steel — disc bearings oil-tight and dust-proof — scrapers made to stand severe strain.

Double setting of discs permits use in very hard, dry ground as well as in loose, trashy soil.

Special "Z" land axle brings land wheel parallel with rear disc beam, permitting plowing close to trees.

Special adjustment on front furrow wheel, causing it to set inside line of front disc so that plow will work close to trees when soil is being thrown to them. Beam has special shape to permit working close to trees.

Write for free booklet on this plow.

# A Bigger Yield From the Same Field

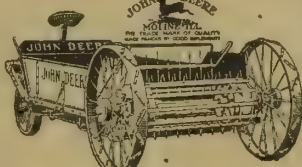

Manure well shredded and spread evenly gets the best results. It goes farther. Plant roots get all of its plant food. On any field that you have been manuring by hand you get approximately a 25 per cent increase in crops by using

## The John Deere Spreader

The Spreader With the Beater On the Axle

Ask any farmer who uses a John Deere Spreader. How much would that mean to you in these years of high crop prices? And you'll find there is a saving of 50 per cent in time and labor.

Beater on the Axle is found only on John Deere Spreaders. Does away with chains, clutches and half the castings otherwise necessary. Means better spreading, fewer repairs.

Revolving Rake which feeds manure to beater evenly, and Ball Bearing Apron Drive, securing frictionless apron travel with no racing, are other exclusive features.

Spreader only high—easy to load. Big drive wheels—light draft. Easy to operate—only two levers—a boy can run it.

Write for free booklet on the John Deere Spreader.

# Thoroughly Disc Before and After Plowing

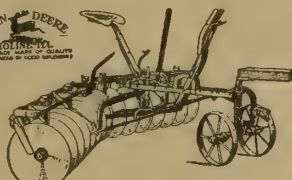

After the grain has been cut from your fields and before the hot August and September sun has cracked the ground, allowing the subsoil moisture to escape, use the

## John Deere Model B Disc Harrow

Noted for Thorough Disking

It produces a fine dirt surface mulch that stops evaporation, of moisture and catches and holds rainfall. Mixes stubble, trash and weeds thoroughly into the soil. Checks weed growth. Pulverizes surface thoroughly—ground is kept mellow—plowing is made easier.

Using the Model B after plowing completes a seed bed that is thoroughly

pulverized through and through—no trash bunches—no clods—no air spaces—seed bed fits the subsoil perfectly.

The Model B is exceptionally flexible—that is why it disks so thoroughly. The spring pressure third lever assures uniform penetration regardless of dead furrows or ridges.

Write now for free booklet on this profitable disc harrow.

# Big Book Free

## Better Farm Implements and How to Use Them

America must produce more food. Labor-saving implements will play an important part in increased crop production.

This book tells all about a full line of labor-saving farming implements. Tells how to adjust and operate many of them. A practical farm implement encyclopedia. Worth dollars.

Illustrates and describes the following machines: Walking and Riding Plows, Tractor Plows, Disc Plows; Disc Harrows, Spring Tooth and Spike Tooth Harrows, Corn and Cotton Planters and Drills, Listers, Alfalfa and Beet Tools, Grain Drills and Seeders, Riding and Walking Cultivators, Lister Cultivators, Mowers, Side Rakes, Loaders, Sweep Rakes and Stackers, Hay Presses, Grain and Corn Binders, Corn Cutters, Stalk Cutters, Kaffir Headers, Manure Spreaders, Portable and Inside Cup Elevators, Corn Shellers, Wagons, Farm Trucks and Buggies. This big book will be sent FREE if you state the implements in which you are interested and ask for Package X-1110.

# The Name "John Deere"

is implement insurance. It fixes the quality, and has done so for eighty years.

Don't forget that goods that have the reputation and are the biggest sellers on the market are the best in their line — always.

The increasing number of John Deere implements in use every year indicates the farmers' final verdict.

John Deere Implements are sold by John Deere dealers everywhere

# JOHN DEERE, MOLINE, ILLINOIS

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

being a county charge, and the sum so paid out shall become a lien upon the property, such lien taking precedence over all other liens excepting the lien of taxes.

The county horticultural commissioner is authorized to issue certificates to public fumigators or sprayers after examination as to qualifications.

It is the duty of the county horticultural commissioner to report on the condition of the horticultural industry in his county to the state commissioner of horticulture each year.

The statutes require any person or organization bringing or causing to be brought into a locality within the state from another locality within the state, any shipment of plants or plant products for propagation purposes, or any orchard appliances which either the county horticultural commissioner or the state commissioner of horticulture may consider liable to be infested or infected with dangerous insect pests or plant diseases, to immediately notify the county horticultural commissioner or his deputy or inspector, and hold the same for inspection.

Each shipment of plants or plant products for propagation purposes brought into any county of California from another county within the state must bear the name and address of shipper and the name of the person, firm or organization to whom same is shipped. A manifest showing contents and localities where grown shall be supplied to the county horticultural commissioner having jurisdiction.

## Tolerance of Alkali in Vineyards

Answering a question as to tolerance of grape vines for alkali Prof. Flossfeder of the University Farm at Davis writes:

"As far as I can understand from Professor Lipman very little is known as to the point of tolerance regarding alkali in vineyards. He informs me that with plenty of organic matter present, that is, when soils contain one and one-half to two per cent of humus, grape vines can get along very well with about .2 to .25 per cent of white alkali. Where the amount of humus is only one-half per cent or even less, the chances are that they will not stand as much as .1 of one per cent of white alkali.

All material in shipments of nursery stock, etc., from one locality to another locality within the state, found to be infested or infected with any insect or animal pests, plant diseases or weed seeds which would be injurious or liable to be injurious to the agricultural interests of California shall be deemed a public nuisance, shall be refused delivery and immediately destroyed or returned to consignor at his option and expense. The remainder of such shipment may be delivered upon disinfection satisfactory to the county horticultural commissioner, excepting that in cases where the insect or animal pests, plant diseases or noxious weeds found in the shipment are not known to exist in the locality where delivered, the entire shipment shall be refused, returned or destroyed as above. A provision is also made that in case shipments as above referred to contain pests or diseases of common occurrence in the locality where delivered and which may be exterminated by proper treatment under direction of the county horticultural commissioner, same may be disinfected at owner's expense and delivered.

The statute directs the state horticultural commissioner to promulgate the names of pests and diseases that may cause damage to agricultural interests of California, and to advise proper methods of treatment and disinfection of plants and plant products or their containers.

A penalty is provided for the violation of any of the provisions of this act.

Then again an important question is as to whether the white alkali consists of common salt or of sodium sulphate. The limits for common salt would properly be .1 per cent to .15 per cent of the soil with plenty of organic matter, whereas in a soil without sufficient organic matter about .05 per cent. In the case of sodium sulphate the same limits might be somewhere between .3 and .35 per cent. However, he informs me that there are no definite limits in the way of figures thus far known.

"As to the black alkali I beg to refer you to Professor Lipman, who I think has got some data on the subject."

## Crops Being Marketed

**B**UREAU of markets of the United States department of agriculture is securing from all the markets of the United States reports of shipments and sales. These reports are distributed to market centers daily and in addition monthly reports are furnished giving an excellent idea of monthly marketing conditions. The report for the past month shows:

### Potatoes Advance

Potato prices dropped early in the first week of July, but are now firm at slightly higher prices. Shipments the week of July 3 to 10, amounted to 3273 cars as compared with 2938 cars during the previous week. Even with this increase, the supply is hardly enough to meet the demands and f.o.b. prices rose to as high as \$5.00 per barrel on the Eastern Shore of the Virginia section. Jobbing prices advanced to \$3.50 to \$5.75 per barrel as compared with \$2.25 to \$3.25 last year for the corresponding time.

### Cantaloupes Cheaper

Cantaloupes from California and

Georgia are moving much heavier than this time last year. Shipments for week July 3 to 10 were 1256 cars as compared with 719 last year for corresponding week. Californias are now selling for \$1.50 to \$2.50 in large lots, \$1.75 less than the price a year ago. Total shipments of cantaloupes to date however, are 4919 cars as compared with 5452 cars last season to corresponding date.

### Georgia Peaches Abundant

Georgia peach shipments are coming heavier than last year, with prices declining but still higher than for the corresponding time last year. The movement of Elbertas has begun. Arkansas and Texas peaches are starting late. Last year at this time shipments were quite heavy from these sections. Georgia peaches are now selling at wholesale \$2.25 to \$3.00 as compared with \$1.50 to \$2.25 per crate last year for the corresponding time.

### Watermelons

Watermelon shipments for the past week were 2392 cars as compared

with 2223 last year for the corresponding week. The heaviest shipments this past week have been from Georgia. Watermelon prices for the past week have declined materially from the high prices which have prevailed to date.

### Onions

The onion movement from Jersey and Kentucky has just started, while

LOS ANGELES - CALIFORNIA

last year by this time receipts were quite heavy. Due to the late season in Jersey and Kentucky, the total of shipments for this past week was considerably less than last year for the corresponding period. Prices of onions continue to decline.

#### Other Crops

New apples are moving in larger amounts from Illinois and Delaware than either the previous week this year or the corresponding week last

year. The shipments of apples for the week July 3 to 10 amounted to 72 cars, more than double the shipments of last year for corresponding time.

Asparagus shipments are decreasing. Only 38 cars were shipped during the past week, considerably less than for the previous week.

Early cabbage shipments are lighter. However, homegrown stock is appearing on many of the markets of the north.

## Standard Apple Act of 1917

From report just made by State Commissioner G. H. Hecke touching upon one act passed by the last legislature we quote as follows:

"The Standard Apple Act of 1917 provides for standards of packing and marketing apples when contained in closed packages. Three grades are established, viz., the "California Fancy," the "B" grade and the "C" grade.

Every closed package of apples packed, shipped, delivered for shipment, offered for sale or sold in California must bear a label giving the grade, number of apples contained in package (variation of five allowed) or net weight, variety, name and address of fruit packer and date of packing.

The selling or offering for sale of apples represented to be "California Fancy," "B" grade or "C" grade, but which in fact do not conform to the standard of the law, is forbidden, excepting that Gravenstein apples may be packed with the stems not retained in the apples.

It is made unlawful to import, sell or offer for sale, or to possess apples infested with any pests or infected with disease, excepting that apples so

infested or infected, grown in California, may be sold as part of the crop to a packer, or may be sold for manufacture into by-products. It is provided, however, that this provision regarding any pests and diseases shall be limited by the variations allowed in the different grades.

It is made unlawful to use any label on apple containers which is false or misleading, and it is forbidden to use the word "fancy" with reference to any apples which do not conform to the standard defined for "California Fancy."

The state commissioner of horticulture is charged with the enforcement of this act and is authorized to sell uniform stamps to be used to designate the grades of apples within the container, same to be sold at the rate of 1/2 cent for each container, the funds from such sale to be expended in the enforcement of the act.

He is authorized to seize and condemn any apples packed, shipped, offered for sale or sold in violation of this act, as a public nuisance.

A penalty is provided for the wilful violation of the provisions of this act.

## Give Canning a Fair Trial

"Don't judge the success of canning by your first effort with whatever product you happen to find in market, when you begin operations," says a statement just issued by the department of agriculture. "It is more than likely that if you are a beginner at canning you will start with strawberries, the first fruit available. If you do you should realize that strawberries are one of the most difficult of all products to can satisfactorily. It is next to impossible, in fact, to can this fruit, as distinguished from preserving it (in which case a much larger proportion of sugar is used), so that its color, size, and texture will be preserved.

"It is normal, if ordinary canning practices are followed, to have strawberries shrink, turn more or less brown, and float to the tops of the

jars. The product is palatable, however, and will keep perfectly if the sterilization has been done properly.

"Don't feel, therefore, that your strawberry canning is a failure. Above all, don't become discouraged and fear that all your canning will be unsatisfactory. Practically every vegetable and fruit worth canning may be canned and kept in a condition fairly comparable in flavor and texture to the fresh product.

"Canned food will be needed next winter as it has never been needed before. Let your slogan be, therefore: 'Can all the food you can; dry the succulent foods which can not be kept well otherwise.'

"In canning, specialize on nutritious foods and concentrate to small bulk by cooking down all vegetables high in water content."

## Placer County Resolutions

The state council of defense is urging farmers to take a strong stand against food speculators. It calls attention to the action of the Bowman Farm Bureau Center of Placer County. That organization has unanimously endorsed: "Whereas farmers are being forced to pay exorbitant prices for seed, in some cases from 100 to 1000 per cent in advance of former cost, and

"Whereas the necessities of living are beyond the reach of people of ordinary means;

"We do earnestly urge that the government of the United States take immediate steps to exterminate the

vicious and parasitic speculator and gambler in foodstuffs."

#### FIBER CONTAINERS

The California Associated Raisin Company finds it is unable to secure an adequate supply of box shooks for the coming season's pack and has turned to fiber containers for its bulk seeded stock. The matter is now being taken up with the trade as to whether this will be acceptable. In any case this is a year in which producer, shipper and consumer must all adapt themselves to war time conditions.

Over there on my car is a set of Federal Tires that have given me not only good wear, but safe travel.

I bought them because I know how they are built on the inside. That's the important point.

Up hill or down, through ruts and holes, and the worst kind of going, those tires stay on the rims, and give perfect traction.

Experience has taught me the value of equipping a car all 'round with Federal Tires.

In the base of each Federal tire four strong steel cables anchor the tire safely to the rim against the hardest kinds of strains. Yet they slip off easily when necessary. Made in white Rugged and black Traffik non-skid treads. Sold by leading dealers everywhere.

### The Federal Rubber Company of Illinois

Factories, Cudahy, Wis.

Manufacturers of Automobile Tires, Tubes and Sundries; Motorcycle, Bicycle and Carriage Tires; Rubber Heels, Fibre Soles, Horse Shoe Pads, Rubber Matting and Mechanical Rubber Goods.

## 1917 IRON AGE

### Low-Nozzle Traction Sprayer

SPRAYS  
4 ROWS

WITH  
12 NOZZLES

The 1917 Iron Age spray bar has twelve spray nozzles covering four rows at one time; there are four direct nozzles for the top and eight side nozzles. This system envelopes the entire plant in a heavy cloud of mist. The side nozzles are adjustable to throw more spray or to change the angle.

It is equipped with a 100-gal. wood tank, double-acting pump, steel angle bar for supporting the spray piping, nozzle strainers and "Iron Age" nozzles. Adjustments can be made to spray rows any desired width.

## Ground Squirrels an Ally of the Enemy

THE ravages of the ground squirrels and gophers must be checked. State Horticultural Commissioner G. H. Hecke is cooperating with the state board of health, the state and county councils of defense, the county boards of supervisors and other organizations to enable the county horticultural commissioners to commence decisive action under the amended county horticultural commissioner law (Section 2322A of the Political Code) to enforce control of rodent pests which are becoming a national menace.

The California ground squirrel stands first today as an undisputed ally of the country's enemies. Every day he is working most industriously to destroy large quantities of the food products of the state of California and that his efforts are crowned with material success will be told by any farmer. Ask the man who has had half of his grain field eaten by squirrels; or the man who has seen his almond crop destroyed; or the man who has watched his vineyard slowly disappear.

Every newspaper in the country today is laying stress on the conservation of food products. Nearly every food product comes from the farm and in this state nearly all of them are affected by the depredations of ground squirrels. Evidently the farmer occupies a most important position among the defenders of the country. It is up to him to keep clear that part of the food line that is in his hands. Most important is to grow the food. Next in importance is to see that the food is properly utilized. Certainly it is an act of defense to prevent the deviation of large quantities of food from the mouth of the soldier to the greedy jaws and sharp teeth of the ground squirrel.

Various estimates have been made of the destructiveness of ground squirrels. Probably the most accurate, however, are the figures compiled by Surgeon J. D. Long of the United States Public Health Service from the carefully investigated reports of 497 farmers who figured the increase in crops and land value after squirrels had been killed on their farms. These statistics show that on 321,233 acres the cost of killing squirrels averaged 11.2 cents per acre while the value of the increase in crops, pasturage, etc., was 34 cent per acre, a net saving of 22.8 cents per acre. Three hundred and seventy persons estimated that their land had increased in value \$2.74 per acre as a direct result of squirrel destruction. There are in California millions of acres of squirrel-infested, cultivated and pasture lands. At the above figures a destruction of squirrels on all these lands would net a saving of \$228,000 on every million acres.

These figures are an average and

show the gain from eliminating the average squirrel infestation. But the squirrel is a colonizing animal and averages do not properly represent his destructiveness. The acre or two on which a colony is located will grow mighty little grain or pasturage. As long as the colony is there the land it occupies and that nearby is waste land, a most unnecessary and inexcusable waste in these days when every foot counts. Where squirrel infestation is heavy over considerable areas, and there are many such localities, their destructiveness becomes all too plainly visible. There are many instances where entire fields of grain two or three hundred acres in extent have been ruined to the extent of not being worth harvesting; there are quite as many cases where fruit and particularly almond crops have been completely destroyed and today the United States Public Health Service, the California State Board of Health and the State Commission of Horticulture are constantly in receipt of complaints of excessive destruction in many widely separate localities.

Now is the time to kill the ground squirrels. Right now the farmer is getting big prices for his products and right now the ground squirrel is eating up more money than ever before. Right now the country has need of food while the ground squirrel keeps right on eating up a large share without making any return for what he takes except to keep alive a large stock of fleas and other vermin. The ground squirrel can be readily killed. It is not a hard animal to get at. There are at hand numerous, proved methods of extermination only requiring a little work and a comparatively small outlay of money to apply them. Every landowner is urged to do "his bit." In addition to each one doing "his bit" what is needed is cooperation. Since squirrels are a widespread pest it requires widespread measures to effectually deal with them. The man who kills the ground squirrels on his own land will undoubtedly reap the benefit but he will reap more benefit if at the same time his neighbors kill the squirrels on their lands, and it will be a more lasting benefit since there will not be left a colony of squirrels to replenish the fields at the next breeding season. Certainly when a man kills the squirrels on his land and so rids his neighbor of a menace to his crops he might expect reciprocity; and usually he will get it. What is needed is simultaneous action. If your neighbor does not understand the necessity of helping you to control this pest, apply to your country horticultural commissioner who, in cooperation with your county council of defense will take measures to enforce the horticultural law that now places the control of rodents in his hands.

## Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Fall Potatoes

In the issue of June 7 we gave from Mr. Musser information regarding planting and suggested that the Burbank potato was an old timer and now

out of the race. This statement by itself was hardly correct, and now the Aggeler & Musser Seed Company, of which Mr. Musser is a member, writes: "While it is a fact that Early White Rose potatoes are more satisfactory generally for planting in Southern California, it is also a fact that Burbank potatoes are adapted to some localities. The Burbank requires a heavy loam soil to get a satisfactory

## Raise Any Crop on Any Size Farm Now Without Horses

YOU can now raise any crop with Avery motor power—corn, cotton, potatoes, etc., as well as grain crops. How to use motor power successfully for raising a crop planted in rows has been until now an unsolved problem. Now you can do it. Plow and harrow your ground with an Avery Tractor—then plant and cultivate with an Avery Motor Planter-Cultivator. See this work done at the Fremont, Nebraska, Demonstration, August 6th to 10th.

### Avery Motor Planter-Cultivator a Wonder

Plants or cultivates two rows at once. Single front guiding wheel runs between rows—double rear driving wheels outside of rows. Turns short either way at ends to go back on next two rows. Costs less to operate than horses or mules. A great success.

### Motorize Your Farm the Avery Way

First, select from the six sizes of Avery Tractors the size that exactly fits your size farm. No farm is too small or too large for an Avery. Six sizes from 6-10 to 40-50 h.p.; fit every size farm.

Then get one or more Avery Motor Planter-Cultivators, as you may need and you have motor power for raising any crop on any size farm.

Write for the interesting Avery Tractor and Motor Cultivator Book. Will tell you many facts about raising any crop on any size farm with motor power.

### Why Avery Tractors Lead

The five larger sizes are the only make tractors built in five sizes all of one design. Special double carburetor and gasifier make them best kerosene burners. Patented sliding frame—least gears and shafting in transmission. Only tractor with renewable inner cylinder walls. 6-10 h.p.; smallest and lowest-priced tractor built.

### Insure Getting Real Service After You Buy

Avery Tractors and Motor Cultivators are built by an established company with many Sales and Service Branches and Distributors, which insure permanent service after you buy an Avery.

AVERY COMPANY, 1825 IOWA STREET, PEORIA, ILLINOIS

# AVERY

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

crop and it is a decided mistake to plant on light or sandy loam. The White Rose yields well in heavy loam and makes a fair crop in light or sandy loam, and that is why it is the safest plan to recommend it for general planting. When Mr. Musser wrote on June 20 he meant to refer to general planting conditions and he did not realize that the letter would be interpreted to indicate that it was a mistake to plant the Burbank anywhere in Southern California."

#### For Corn Ear Worm

The question was raised by a subscriber as to possible danger to stock from eating corn fodder where arsenate of lead, for the control of the corn ear worm, might have lodged on leaves or in the angle between leaves and stalk. This question was referred to Mr. Marks of the Germain Seed & Plant Company, who has had considerable experience in the use of this remedy, and he answers regarding this point, also as to dusting interfering with pollination:

"As far as we know there is no danger of poisoning with Corona Dry on account of any material lodging on corn stalks. We have had a report from E. L. Koethen of Riverside to the effect that he fed corn dusted with it to stock without any injurious results. We would not want to go on record as absolutely guaranteeing that corn stalks dusted with it would not result in poisoning, but we feel it would be a safe thing to do. There is so little of the poison that gets onto the corn stalk that there is little danger of poisoning. Regarding dusting the silk interfering with pollination, we have no evidence of this. Corona Dry has been used for the past three years now on corn ears and we have never heard of a barren cob being produced from its use.

#### Field Mice

I have a small two year old lemon orchard which is surrounded on three sides by barren hills from which come a great many field mice or moles which eat the bark around trees especially where I have basined and mulched the trees. These animals are about two-thirds the size of a common rat, but look more like a mouse. They have a tail about one and one-half inches long. Is there any kind of a solution I can soak grain or anything else in and sow broadcast to poison them? They are so numerous and hide in the mulch which I am using so easily, that it will take something quite drastic to have any effect.—Subscriber, Pomona.

See Cultivator of July 8, 1916, page 12, regarding this pest. In a word, the treatment consists in preparing poisoned cracked wheat or alfalfa. Strychnine is used. Above all pull the mulch away from the trunks of trees and give thoroughly clean cultivation. Do not allow weeds or any rubbish to collect. This has been a serious pest in various parts of California. Write to United States Department of Agriculture, Washington, D. C., for Farmers Bulletin 670 which gives full illustrations and different means of poisoning and control. A general discussion of field mice the United States over is also given in United States Biological Survey Bulletin 31, United States Department of Agriculture.

#### Ration for Laying Hens

Please advise best ration for 100 laying hens, also ration for young chicks.—Subscriber, El Cajon.

The best suggestion in the matter of a ration is to refer the inquirer to "Poultry for Profit" by Mrs. J. A. Koehn, published by the Cultivator Publishing Company, \$1.00. We may say larger value is hard to find than this one-dollar book on poultry. It devotes many pages to discussion of feeds and gives balanced rations recommended by many experiment stations. The first thing to consider is, "What feed is available and what feed is the low-

est in price?" The book gives the following suggestive ration, which has been recommended by various experiment stations: Grain: 10 pounds corn, 10 pounds wheat, 5 pounds oats. Dry mash; 5 pounds bran, 5 pounds shorts, 3½ pounds meat scraps. The mixed grain is fed in deep litter. The dry mash may be kept before the small breeds constantly. This was of course recommended when wheat was at normal prices. It could be in part replaced with barley or some of the sorghum grains, to which might be added meat or fish scrap to increase the supply of protein.

#### Real Estate Agent's License

Please inform me in regard to the new real estate law. Does it mean that one acting as agent for another in selling real estate must have a state license before he can charge commission? — Subscriber, Yorba Linda.

Yes, where one is to act as agent and collect commission, a license is necessary.

#### Carbon Bisulphide

Please advise if it is necessary to light carbon bisulphide when it is put on cotton and placed in mole holes, or is it sufficient to put in without lighting?—Subscriber, Cummings.

Some do and some do not. Some think the poisonous gas is driven to lower depths in the burrows if it is exploded. It is, however, deadly gas in either case.

#### Moles

What is the best method of eradicating moles in garden and lawn, which go through after each irrigation and destroy rose bushes and other plants? —Subscriber, Santa Ynez.

The only satisfactory way to handle the mole is with the regular mole trap. Seed houses and dealers in garden tools can furnish you these traps. The mole is hard to poison for its food is principally grubs and live worms. It scarcely ever destroys plants except as it does so by forcing up the ground.

#### Fertilizer for Potatoes

Would you advise liming potatoes after they are cut and just before planting? Have sandy loam soil which raises fine potatoes but not enough of them. The soil seems to be lacking somewhat in humus. What would be a good fertilizer to use when planting the seed?—Subscriber, Yucaipa.

The best substance to use with freshly cut potatoes is land plaster or gypsum. This is scattered over them immediately after cutting and the potatoes are then allowed to dry in the shade before planting. The use of lime on soil deficient in humus only aggravates the situation because lime attacks the little remaining humus. Such soil should be treated with a heavy application of stable manure, but of course this cannot be done while producing a crop of potatoes. The best treatment for such a soil where planting is to be immediate would be the application of a complete fertilizer rich in potash. This might well be applied in the furrow before the dropping of the seed.

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

#### Shooting Chicken Thieves

What penalty, if any, would attach to shooting a man caught in the act of stealing poultry?—Subscriber.

This would be an assault with intent to kill and could not be justified upon the ground of the trespass or to expel the trespasser. In such case the owner of the property may use such reasonable force as is necessary to prevent the injury or destruction of his property or to defend or regain the possession thereof, short of the use of a deadly weapon. What is such reasonable force is a question of fact for a jury. Assault with intent to kill is a felony punishable by imprisonment in the state prison.

#### Shooting Trespassing Stock

What penalty, if any, would attach to shooting live stock where the owner of the stock after frequent remonstrances persists in trespassing? — Subscriber.

The law under the head of "Estates", heretofore many times given in these columns, provides the remedy for the owner of the property to take. If the property owner should shoot and kill or injure the trespassing stock he would undoubtedly be held civilly liable for the value of the stock injured; it is probable that he could be held for the commission of a misdemeanor punishable by a jail sentence. Consideration for the public does not contemplate that any individual shall thus take things into his own hands.

#### Connecting Pipe Line

Six years ago I bought a ranch which was connected to the pipe lines of various water companies by a pipe line owned by one of said companies. This company now claims that neither I nor my predecessors had any right

to use this connecting line. The pipe line on my ranch is useless without the connecting line. This line has been used by myself and predecessors for the last 15 years; the first objection was made about a year ago. The line is used to supply other ranches below. No agreement in reference to this pipe line is known, but it was probably given for a right of way across my land. Can the use of the line be denied? — Subscriber, Claremont.

Whenever a corporation furnishes water to irrigate lands which the company has sold the right to the flow and use of the water remains a perpetual easement to the land; whenever a person cultivating land on the line and within the flow of any ditch has been furnished water by it to irrigate the land such person shall be entitled to the continued use of the water. The continuous, uninterrupted use of a pipe line for more than five years under a claim of right to so use it will ripen into a permanent right to the use of same. Thus it will be seen upon the facts stated that you are entitled to the use of the connecting line.

## REMCO REDWOOD PIPE TANKS and SILOS

We have been manufacturing the famous Remco products for over a quarter of a century.

We know how to build these products.

We know that air-dried redwood will outlast any other material except cast-iron. We can prove it to you because we have installations still in existence that were put in during our first year in business.

We have over fifty million feet of DRY REDWOOD to select our pipe and tank and silo material from. Think what this means in the way of perfect redwood. We do not use imperfect material. We do not have to.

**Every Foot of Pipe, Every Tank,  
Every Silo Bears Our Guarantee.  
Any Bank in San Francisco will

# Preservation of Vegetables

By Prof. Wm. V. Cruess

PROF. WM. V. CRUESS of the State University writes that he has gathered together and put in popular form a series of articles on the subject of food preservation. We give here directions for drying of summer vegetables, canning vegetables by the lemon juice method and making of tomato paste. Others will follow in later issues.

## THE DRYING OF SUMMER VEGETABLES

Because of the scarcity and high price of cans and jars, it becomes necessary to devise other methods than canning for the preservation of the surplus vegetables. The abnormal

demand for food at the present time has stimulated the planting of home and small gardens. The falling price of potatoes indicates that this increased planting has had its effect on the supply. It is probable that much of the surplus will spoil or become too ripe for use unless information upon new methods of preservation is made available.

Practically all of the small vegetables may be satisfactorily dried and preserved in the dry state indefinitely. Under California conditions we may dry the vegetables without the use of artificial heat. This makes the process very cheap and convenient.

### Trays

Ordinary fruit trays can be utilized

for the drying of vegetables. If only a few pounds of vegetables are to be dried, paper or cloth may be used for trays, or improvised trays may be made of any lumber available.

Potatoes must be sulphured before drying. A very convenient way of sulphuring is to stack the trays of cut potatoes and cover the stacked trays with a large box made for the purpose. This box may be constructed of a light wooden frame covered with ordinary tar or building paper. The sulphur box should be considerably larger than the trays so that room will be available for the insertion of a pan of burning sulphur. For example, if the trays are two feet by three feet the sulphur box should be about 36 inches by 40 inches. This will allow space of one foot at the side. A small pan of sulphur may be placed in this space on the ground. The sulphur may be lighted by plac-

ing a few shavings in the pan of sulphur and covering the shavings partly with the sulphur or by dropping a few coals in the pan of sulphur before it is placed in the sulphur box. This same sulphur box may be used for the sulphuring of such fruits as apricots, peaches, and pears. The following special directions may be followed in the small scale or home drying of various summer vegetables:

### Peas:

Select peas at the optimum stage of ripeness. They should not be too ripe. Shell and spread on trays. If wooden trays are not available, paper, canvas or cloth may be used. Expose to the sun until dry. Store the dried peas in such a way that insects can not reach them. It is a good plan to place them in a flour sack or similar bag and wrap the bag in heavy paper so that insects can not lay their eggs through the cloth, or the dried peas may be stored in ordinary glass jars.

### Corn:

The corn used for drying should not be too ripe. It should be tender and sweet. Remove the husks and immerse the corn on the cob in boiling water for about three to five minutes. Chill it in cold water and cut from the cob. Spread on trays in the sun and allow to dry.

### Tomatoes:

Tomatoes can not be successfully dried in a cold moist climate. Bright sunlight and dry weather are essential. Cut the tomatoes in half or in thick slices. Spread on trays and allow to dry in the sun. It may be necessary to turn the tomatoes to prevent molding. Dry them until they are tough and leathery in texture.

### Cooking Dried Peas, Corn, and Tomatoes:

Corn should be soaked two to four hours, using two cups of water to one cup of corn. Peas should be soaked about 24 hours before cooking. Dried tomatoes will require at least 24 hours soaking or longer to soften them. The soaked vegetables are then seasoned and cooked in the ordinary way. The drying process results in loss of flavor and the dried product will therefore require more seasoning than would the fresh vegetables.

### Irish Potatoes:

Peel and cut into slices about one-fourth or three-eighths of an inch thick. Spread on trays. Sulphur the sliced potatoes on trays for 20 minutes. Speed trays in sun until potatoes are dry. Unless the potatoes are sulphured in this way they will be dark and unpalatable. To cook them, soak them in water for 24 hours and cook in the usual way.

### Sweet Potatoes:

(Farmers' Bulletin 841) — Select sound roots. Wash, boil until nearly done, peel, and run through a meat chopper or slice. Spread on trays and dry until brittle.

### Pumpkin:

Cut into strips and peel off the outer rind. Cut the strips into thin slices about one-fourth of an inch thick. Spread on trays and dry.

### Squash:

Squash may be treated in the same way as pumpkin.

### Cabbage:

Select well developed heads. Strip off the outer leaves. Cut into strips about one-fourth of an inch thick. Spread on trays and dry.

All of the above products must be stored away from insects. It may be found a good plan to sterilize all dried

# SUDAN HAY

## -the money-maker of 1917!

Never in the history of the country have hay prices been so high—the nation is suffering from a scarcity of hay caused by unfavorable weather and other conditions. The California farmer has a chance to profit heavily by this nation-wide hay famine—if he plants Sudan Seed at once. This means a big crop of rich, sweet, nutritious hay in 40 to 60 days, with irrigation.

Sudan hay yields eight to ten tons per acre per season. It far outclasses timothy, barley and rye in nutritive value and stock relish it keenly. It is sweet and succulent and stock thrive on it without a grain ration. Recommended by all leading agricultural authorities. California and

Arizona State Experiment Stations have made wonderful records with Sudan. It grows five to six feet high in 40 days—grows thick—crowds out all weeds—easy to raise and handle—sells readily—will command high prices this season.

The time to plant is now—means easy money for farmers who act quick. Big free illustrated folder by return mail.

## Special Prices For July:

Single pounds (enough for 50x50 feet)—36c.  
10-lb. lots (will plant half an acre, sown broadcast)—34c per lb.  
25-lb. lots—32c per lb.  
100-lb. lots—28c per lb.

GROWS  
5 to 6 FEET  
in  
40 days!

vegetables immediately after packing for storage by placing them in the oven for about 15 or 20 minutes to heat them through thoroughly. This will kill any insect eggs that may have been deposited on the vegetables during drying.

#### CANNING VEGETABLES BY THE LEMON JUICE METHOD

Vegetables are very difficult to sterilize because of their composition and because they contain bacteria that are very resistant to heat. Most vegetables are deficient in acid. This makes it very hard to kill these heat resistant bacteria. If we add any harmless fruit acid, such as the acid of lemon juice, or vinegar, the vegetables become as easily sterilized as fruits. The following method may be successfully used in the household. This method makes it possible to sterilize vegetables in one sterilization without the use of a pressure cooker.

#### String Beans or Peas

Prepare a brine consisting of three ounces of salt and six ounces of lemon juice to the gallon of water. String the beans and break into proper lengths for cooking. Pack them into jars or cans. Fill the containers with the brine described above. Place the rubbers and caps on the jars loosely but do not screw down the caps. Sterilize as follows: Place a screen or cloth or other false bottom and fill the container with water to within about one-half of the height of the jars. Heat the water to boiling and boil for about one and one-half hours. Seal the jars at once.

#### Asparagus:

Asparagus may be canned in the same way as described for string beans, but in this case the amount of lemon juice may be reduced to four ounces to the gallon.

#### Corn:

Corn is very difficult to sterilize. In this case eight ounces of lemon juice is used to the gallon and the corn must be sterilized for two and one-half hours. The amount of salt is three ounces to the gallon.

#### Tomatoes:

Tomatoes contain enough acid of their own to make them easily sterilized and therefore no lemon juice need be added.

#### Other Vegetables:

Other vegetables, such as carrots, beets, turnips, etc., may be sterilized in a brine consisting of five ounces of lemon juice, three ounces of salt to the gallon, followed by sterilizing in boiling water for one and one-half hours.

#### Use of Vinegar:

Where vinegar is used, use one and one-half times as much as recommended for lemon juice; that is to say, if six ounces of lemon juice is recommended, use nine ounces of vinegar, should vinegar be used instead of lemon juice. Vinegar gives as good results as lemon juice when used in this proportion.

#### TOMATO PASTE

Canned tomatoes form a very important part of the diet of the ordinary family. The canned product consists of about 95 per cent water. Because of the scarcity and high price of tin, cans and jars this season, it will be readily seen how much space is wasted by canning tomatoes in their natural state. They may be concentrated to about one-eighth or one-tenth the original volume, and the concentrated product will contain all of the food value and all of the flavor

and color of the fresh tomatoes. The concentrated product is called tomato paste or Italian conserve. The following method of manufacture is applicable to household conditions and results in a product containing all the value of the fresh vegetable.

Boil the tomatoes until tender. Crush thoroughly and pass through a fine sieve or screen to take out the skins and wood portions of the pulp. Place the strained pulp and juice in a shallow pan and boil down over a slow fire to a thick consistency. Do not boil until it begins to scorch, but boil down as far as possible without scorching. Then place the pan at the back of the stove where the heat is not sufficient to cause the paste to stick to the bottom of the pan or scorch. Allow it to evaporate under these conditions very slowly until it has become very thick and pasty; that is, until it reaches about the consistency of peanut butter. It should then be packed into scalded jars hot. The jars should be sterilized in a wash-boiler sterilizer as directed in previous circulars on canning for one hour. The jars should then be sealed.

The tomato paste made as above will be unflavored and would be used in the same way that fresh tomatoes are. It may be diluted several times with water and used as a flavor for various dishes or it may be used as soup stock, etc. The flavored tomato paste may be made by a recipe given

by Mrs. Jessica Hazzard of Los Angeles:

To one gallon of tomato juice and pulp add two sliced onions, two buttons of garlic, one bay leaf, and chili peppers to flavor. Boil down until thick over a slow fire and then concentrate over a steam bath or on the

back of the stove to a thick paste. Beat in olive oil and salt to flavor. Store in jars or cans without sterilizing.

It is urged that the concentrated tomato paste be made this season rather than that the tomatoes be canned.

## Raising Jimson Weed

Written for California Cultivator By Martha L. Baker

RAISING jimson weed for commercial purposes promises to be a profitable industry for ranchers of the San Joaquin Valley. Work has just been completed on the harvesting of the first crop in the vicinity of Porterville, Tulare County, where several hundred acres are under cultivation this year for the first time.

Last year a Pasadena firm employed a local representative to buy up all the wild jimson weed he could get in the Porterville district. About \$1700 worth was picked, by children mostly, and shipped to the southern buyers. It is used for medicinal purposes.

This year the same firm offered to furnish the seed for planting and contracted to buy up the product at 12 cents per pound. They secured contracts for about 500 acres, but not quite that amount was put under cultivation this season. Estimates place the returns at from \$150 to \$200 an acre.

Jimson is planted the first of April. The soil is prepared the same as for planting corn and the jimson is planted with a drill in furrows far enough apart to allow of cultivation and is cultivated much like potatoes.

The harvesting of the first jimson crop begins when the plants are about six inches tall and is a sort of a thinning process. The whole plant is pulled up and dried. The roots, stem and leaves of this young plant are used. At the three other crop harvestings only the leaves are picked, dried and crushed through a sieve, and sacked for shipment.

Like a number of other industries this of raising jimson, whose botanical name is *datura stramonium*, is a "war baby" project. The present war preventing the shipment to this country of belladonna, a medicinal plant, manufacturers of medicines had to start the propagation in this country of something to be used instead, hence the jimson weed which has long been more useless than useful except as a few who knew its remedial qualities used the leaves as poultices.

## For Better Shooting---

A MAN is so busy these times that when he does get a couple of days' hunting or an afternoon at the traps, he is looking for *action*.

He wants to be sure about his *gun*—and that is one great reason why everybody speaks so highly of the Remington UMC Pump Gun and Autoloading Shotgun.

And in shells, you will get Remington UMC results only from Remington UMC Smokeless "Arrow" and "Nitro Club," the *steel lined* "speed shells"—and in *black powder*, the old established "New Club."

**THIS WEEK'S COVER**

Meeting conditions as they are without waiting for all the comforts of civilization is shown in the illustration on the cover page of this issue. Arizona, like many sections of California, is yet new, and when up-to-date dairymen learned of the advantages to be derived from cow testing associations they organized and a cow tester was put into the service. But the homes of the pioneers were not all built so that the once-a-month visits of the cow tester found them unable "to sleep him" except out under the blue vault. Then the cow tester provided his own Pullman car, as is shown in the illustration. This is Mr. Watson Pickrell of the college of agriculture of the University of Arizona, first tester of the Arizona Pioneer Cow Testing Association. He has been advanced to the position of county agricultural agent for Pima and Pinal Counties. He not only uses his Ford to carry his outfit from dairy to dairy, but, as may be needed, makes up his bed in the machine wherever night overtakes him. Most interesting information regarding the Arizona methods of cow testing may be had in Mr. Bemis' article on Page 51.

**MUTUAL INSURANCE**

The fires which destroyed so much valuable property in Ventura County were to a degree a test of the stability of cooperative fire insurance. With many other counties of California Ventura has organized a County Mutual. It is not exclusively a farmers institution, that is, under the present state law it is permitted to carry insurance to a very limited extent in cities.

The Ventura County organization has had losses before, all of which have been quickly paid. This last fire

however, caused the greatest losses it has ever had to meet. The total was about \$25,000. The reserve fund amounted to only about \$20,000. The directors promptly went to the banks and secured the remainder and are still doing business at the old stand. They will continue to do more if business methods of this type are followed. So far as we have learned there is not one fifty-cent-on-the-dollar Mutual Fire Insurance Company in California.

**HIS EYE OPEN**

"Produce More"; "Save a Starving World"; "The Farmer Will Win the War"; and a few other slogans of like nature have been popular for several months. The farmer has answered the call; in some instances to his profit; in others to his loss. Onions in the Stanislaus section could not be sold for enough to pay for harvesting, but that condition has been in part corrected. In Riverside County the potato growers gathered themselves together and are securing fair recognition and some little return for their crops. But it is developing that some of those who shouted loudest for greater production are singing lowest as to returns to producers.

It is now time for planning another season's crops, and the farmer is ready to produce greater than ever if implements and supplies may be had, but it is useless for him to consider greater investment and greater production unless he protects himself from the sharks in the markets. No better time for cooperative effort ever offered itself, for the farmer now realizes more clearly that in all times and all seasons he will be exploited if he does not have his cooperative eye wide open.

**SENDING OUT LIVE STOCK**

Our news columns have an item regarding the sending of a quantity of live stock from Imperial Valley to Kansas City packing houses. The Eastern packer will pay freight on the stock, cure and pack the meat in Kansas City, pay more freight on the finished product back to California—and the consumer pays all.

This offers a problem worthy of some experts in economics. Why should California stock sell at prices which make it attractive to Easterners to pay high freights and suffer the losses which come from long hauls? There are packing houses in California, but perhaps not enough to take up this stock at prices which Easterners are willing to pay. In any case, they do not manufacture enough of the finished product for California's own use. A San Francisco packer is making a campaign of putting up some of California's best in a California packing house and advertising it as a California product. This is especially the case with bacon.

Now is there not some way in which, either through cooperation or otherwise, we may secure the finishing of this product in California or at least some place nearer than the Missouri River?

**TORRENS TITLE**

With the announcement that the federal loan bank will accept the Torrens titles only after they have been in force for 12 months farmers who may possibly wish to secure these in the future should take early steps to perfect their title under the new state law. Many savings banks whose directors have interests in certain title insurance or guaranty companies have

announced that they will not loan on the Torrens title. This forces the farmers either to pay the higher costs under the old system or to make other provisions for securing capital such as the federal farm loan. We believe this will result in more general use of the farm loan and in addition the ultimate organization of cooperative loan organizations. We see no reason why farmers may not have organizations similar to the building and loan associations of this state. Money is essential to the success of farming, and if we are to succeed in a large way we must have larger capital. This cannot be if the banks take the attitude which they have in several counties. The expense of making a loan is prohibitive, and as recently said in the San Francisco Chronicle: "This will continue until a sufficient number of farmers obtain Torrens titles to create a real demand for loans upon land whose title is established in that way. At present the number of farmers who have secured Torrens titles in this state is negligible. The cost of a Torrens title should not exceed that of having the title passed on by an attorney preliminary to obtaining one mortgage loan. It is improbable that much progress will be made in securing Torrens titles until some one finds a way to make money by promoting the movement. It will doubtless require a full generation to complete the change."

**SOME TRUST**

Federal investigation is developing the fact that the present prices of print paper demanded of every publisher are entirely unjustified in view of any actual increase in cost of manufacture. It must be admitted that nearly all costs have advanced, but in the manufacture of print paper, not to 100 or 150 per cent. Publishers of the United States are being forced to pay unjust prices, but we do not believe it will be permitted many months longer.

**PREMIUM ON BONDS**

We note in daily press a quarter-page ad of "Federal land bank 4½ per cent farm loan bonds," with extended description of the bonds such as "interest payable semi-annually," "denominations \$1000, \$500, \$100, \$50, \$25," etc. "Price \$1. 01½ and accrued interest." These bonds are not offered in this advertisement by the federal land bank but by various financial and bonding institutions and the question naturally comes to producers, "Why 1½ premium? In other words, why may not any of us go to the federal land bank and purchase these bonds at par? Why should an expensive advertising campaign or commission to brokers be necessary? If the bonds are worth above par why may not this fund go to benefit the borrower that ultimately a lower rate of interest may be granted to him?" We admit we may not be long on financial matters but it appeals to us that the people should have the benefit of the premium.

**LOAD AND UNLOAD**

There is an appeal that loading and unloading of freight cars be expedited. There is a shortage and it has been found upon investigation that freight cars are on sidings, and practically idle, more than half the time.

In Spain they control this matter of freight congestion by the government authorizing the railroad to sell at auction all merchandise not withdrawn by the consignee within five days from date of its arrival. This would hardly be tolerated in the United States unless, possibly, war time practice might justify it.

**Agricultural News Notes**

The government of New Brunswick is encouraging agriculture by the appointment of experts to advise farmers as to best cultural methods.

England is contemplating the substitution of syrup from grapes as sweetening for jams and marmalades. Extensive experiments have been carried on to work out the best process.

Of the loans to farmers approved by the farm loan banks up to July 1, Texas has the largest amount, a million and a quarter. Oklahoma comes next. California is third with \$956,000.

Bulk shipments of wheat are being made from Australia to European ports. The elevator method of handling wheat is new in Australia, bagged shipments having prevailed in the past.

Canned salmon will be admitted to Britain in one-half the quantities which were imported during 1916. There has been complete prohibition on imports of salmon since February 23rd.

Twenty-three states of the United States went "bone dry" on July 1 when the federal law went into effect prohibiting shipment of liquor into any territory where its manufacture or sale is prohibited.

There are 756 mills in the United States which crush cottonseed for oil. A billion and a quarter pounds were produced during the season ended April 30. Of olive oil last season a million and a quarter pounds were produced.

Forty-nine per cent of the total sugar consumed in the United States is produced in seven Western states, two Southern states and insular possessions. The remainder, or more than half, comes from Cuba and other foreign countries.

There are 3141 Philippine Islands with an area of 119,542 square miles. The six principal crops are grown on 8.5 per cent of this area. The greatest crop is rice, next in order, abaca (Manila hemp), corn, coconut, sugar cane, tobacco and maguey.

A market news service for grain, seed and hay has been established by the office of markets of the United States department of agriculture. Reports will be made every two weeks on stocks in hand, shipments, demand and prices in various sections of the country.

There has been an improvement in general crop conditions the country over since June 1. The composite condition of all crops was on July 1, 2.1 per cent of their ten-year average. The total acreage in cultivated crops this year is three per cent greater than last year.

We have surely planted corn this year—over 121 million acres for the United States. The entire acreage in winter and spring wheat is 46,692,000. The July forecast for the corn crop—by the United States bureau of crop estimates—is 3,124,000,000 bushels. Only 23 states are included in these totals; California does not figure at all.

Before the war the United States imported most of its wool from Australia and New Zealand. Last year the wool importers of this country had to scour the world to keep the mills of New England busy and supply the needs of tailors and clothing manufacturers. We bought nearly 160,000,000 pounds in Asia, 79,000,000 pounds in South Africa and a little over 121,000,000 pounds in Australasia. The remainder came from various corners of the world, picked up in small quantities by alert Yankee commercial agents.

# Agricultural News Notes of the Pacific Coast

## Northern California

Plumas County farmers are appealing for more help.

Humboldt County is appealing for a live stock inspector.

The Yuba City, Sutter County, cannery, opens this week.

Yolo County warehouses are already filled with grain.

One Sutter County grain farmer marketed over 90,000 sacks of grain.

The Placer County farm bureau is discussing the holding of a county fair.

Glenn County's output of barley and wheat will be 20 per cent greater than normal.

New rural carriers are to be on the routes from Biggs and Paradise. Butte County.

A canning club has been formed amongst the high school girls at Gridley, Butte County.

Lumber mills near Oroville, which have been closed for six years, are again in operation.

One holder of a quarter section in Butte County sold his crop of grain this year for \$16,000.

All citrus sections of the northern valley report serious losses to Washington Navels from the heat wave.

One implement dealer of Butte County recently sold in one day 29 binders, 20 tractors and three gang disks.

Olive growers of Butte County have formed an association and propose to build a large factory for curing and packing olives.

The Paradise Irrigation District, near Oroville, Butte County, will soon have water on a large tract of land not heretofore cultivated.

The Placer County farm bureau has organized a purchasing and marketing association, articles of incorporation for which have been filed.

The Stanford Ranch, near Vina, has the heaviest crops for years. Twenty-three thousand acres of wheat and barley are now being harvested.

## Central California

A general squirrel campaign is to be prosecuted.

The Prune and Apricot Growers Association is asking for additional capital.

Kern County farm bureaus are pulling off a farm bureau membership contest.

The growing of Jimson weed is becoming a great industry of the Porterville section.

Yosemite Valley gets a \$250,000 appropriation for improvement the coming year.

Lindsay, Tulare County, will soon have a new plant for processing and packing olives.

Kings County's output of table grapes will be immense, aggregating about 5000 tons.

Santa Clara Valley prune pickers propose a wage of three dollars for ten hours' work.

Tomato canning will begin at Lindsay about August 1st. One plant there will handle 1500 tons.

The West Side Irrigation District of San Joaquin County has just marketed \$295,000 worth of bonds.

Independent peach buyers have contracted for cured peaches at around nine and nine and a half cents.

Horticultural Commissioner Howard of Kings County is supplying ranchers with poisoned grain, two pounds for 25 cents.

"Twenty per cent above normal" is the report received from many of the table grape districts of the central part of the state.

The Valley Fruit Growers' Association of Fresno is arranging with school boys of various sections to aid in harvesting fruit.

The California Peach Growers', Inc., is discussing the matter of 1917 prices. Orders have already been received for several hundred tons.

The apricot season just closed at Selma, Fresno County, has shown a crop much larger than anticipated. The quality was first class.

## Southern California

Pomona canneries are employing about 800 helpers.

Hay balers are busy in all parts of Southern California.

The Yucaipa Apple Association is planning for the coming season's pack.

One tract of 150 acres is to be planted to onions at Nuevo, Riverside County.

Santa Barbara County has some of its first cured apricots ready for the market.

Palo Verde will show some of its own growing of cotton at the Riverside fair.

The cherry crop of Beaumont was 300 per cent greater than any preceding year.

One refrigeration plant at Brawley can supply ice for 100 carloads of cantaloupes daily.

The Coachella Valley of Riverside County is to have a local agricultural fair November 1-3.

The San Fernando Valley reports abundant help in the harvesting of its apricot and small fruit crops.

A train of 30 cars with beef cattle is being shipped from Imperial Valley to Kansas City packing houses.

The cannery at Arlington is having a full run on apricots. Its principal helpers are women and children.

The Imperial County farm bureau is planning for a \$25,000 fund to be used in bringing agricultural help into the county.

The sealer of weights and measures of San Bernardino County is making a campaign against short weight berry boxes.

There has been organized in Riverside County the Allah Date Gardens, which will plant a large tract in Coachella Valley.

The Southern California Poultry Producers' Association has compromised with members who had been sued because of marketing outside of the association, contrary to contract. The association hopes to work harmoniously.

## The Coast

Bellingham, Washington, is marketing its largest raspberry crop.

An Arizona honey producer recently sold a carload of honey at \$3660.

Erection of an immense grain elevator is under way at Portland, Oregon.

Arizona farmers have planted extensively to tepary beans and grain sorghums.

Farmers of Lewis County, Washington, report crops maturing the latest of any season.

Walla Walla, Washington, has been selected as a place of meeting for the 1918 state grange.

Arizona is having fine summer showers, the precipitation at Willcox last week aggregating 1.10 inches.

Three hundred thousand pounds of wool produced in Umatilla County, Oregon, recently sold at 60½ cents.

A drainage project of Pierce County, Washington, if carried out will reclaim hundreds of acres of rich land.

One Oregon wool sale is reported at 72½ cents. The amount reported in the one sale aggregates 65,000 pounds.

A large manufacturer of York state has arranged a plant for the handling of flax in the Willamette Valley, Oregon.

One Yuma Valley, Arizona, rancher recently took a carload of hogs to Los Angeles and sold them for nearly \$1400.

Immense vegetable and fruit drying plants have been erected at Wenatchee, Yakima and Spokane, Washington.

Labor troubles are not only affecting copper mines of Arizona but producers fear the losses will be heavy in all lines.

Continued rains in Whatcom County, Washington, have waterlogged many of the lands and some crops have suffered.

The community packing of apples being tried out in the Pacific Northwest apple growing sections is proving satisfactory.

## ABORTION IN CATTLE

**PREVENTED AND CURED PERMANENTLY**  
**YOUR COWS MADE PROMPT. REGULAR BREEDERS BY**  
**STERILOID**

### STOP LOSING CALVES

**TREATMENT:** If STERILOID is used at the first sign of

have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

**GUARANTEE:** We will refund money in every case when STERILOID FAILS to make good. Price \$1.00. Mail postpaid, in plain wrapper. Dept. L, 898-408 Columbus Ave., New York City. Reference, Colonial Bank

## Vaccination Against Anthrax

LOSSES from anthrax, or charbon, which at the present time is responsible for the death of large numbers of live stock in low, moist

lands of a more or less mucky character, may be minimized, according to specialists of the United States department of agriculture, by the proper use of protective vaccine and the proper disposal of the carcasses of infected animals. This disease affects chiefly cattle and sheep, but none of the domestic animals is exempt, and even man is sometimes a victim. Some centuries ago it is known to have caused the death of more than 60,000 persons in southern Europe. Since that time the disease has apparently become less virulent but it is still the cause of considerable loss to stock owners.

The preventive vaccine is a development of the method devised about 25 years ago by Pasteur. Since that time scientists have succeeded in removing many of the objections to Pasteur's vaccine, and the new method is less dangerous and surer.

In a new publication, Farmers' Bulletin 784, detailed directions for treatment are given. It consists in ordinary cases of an injection under the skin on one side of the animal of ten cubic centimeters of anti-anthrax serum, followed immediately by a similar injection on the other side of the body of one cubic centimeter of spore vaccine. In the case of sheep, which are peculiarly susceptible to the disease, the quantity of vaccine is reduced to one-fourth of a cubic centimeter.

Stock owners are warned to obtain the serum and vaccine from reliable manufacturers only and not to administer the treatment unless the disease has already appeared in the vicinity or the pastures on which the animals are to be turned out are known to be infected. Careless handling of the vaccine may result in spreading instead of controlling the disease.

The principle underlying this treatment is the same as that which in man has resulted in the minimizing of death from smallpox, typhoid, and other diseases. It consists in conferring an artificial immunity to the infection. The introduction into the body of a very much weakened form of the germ that causes the disease will build up in the body resistance to subsequent attacks of the same disease. A fly can easily carry a sufficient quantity of blood from an animal infected with this disease to kill a horse. Nevertheless, by repeated inoculations, scientists have succeeded in developing such a high degree of immunity in a horse that the animal has been able to withstand the injection of more than a pint of the

most virulent anthrax culture obtainable. This, of course, is a much higher degree of immunity than is required to insure an animal against ordinary infection.

The cause of anthrax is a minute germ which multiplies rapidly in the body, especially in the blood, and produces poisonous substances which ordinarily cause death. The symptoms of the disease resemble those of tick fever and blackleg. The differences which will enable stock owners to distinguish it from them are described in detail in the bulletin already mentioned. In acute cases treatment is seldom effective. For this reason the best methods of combating the disease are to vaccinate all animals likely to be exposed and by deep burying or cremating of infected carcasses, to make certain that the infection is not allowed to establish itself in pastures.

It is a well known fact that under certain conditions and in certain forms the germs of the disease are remarkably resistant to heat, cold, and drouth. They will remain for a long time in a pasture and be capable of infecting any animals turned out on it. Ordinarily the disease is taken into the body through the mouth with food. It may, however, be absorbed through a wound scratch. It is in this way that human beings usually become infected, and the name "wool-sorter's disease" is derived from the fact that men engaged in sorting wool are particularly liable to contract the disease through infection of small wounds on their hands.

Experiments have shown that if the carcass of an infected animal is buried promptly, without having been opened to permit the entrance of air, the anthrax germs die within a short time. If, on the other hand, the carcass is allowed to remain in the field or is thrown into a nearby stream, the gradual decomposition favors the transformation of the germs into minute spores. It is in the form of spores that the disease persists so long. For this reason great care should be taken never to skin or to cut open the body of an animal killed by anthrax. The blood that flows out when this is done is one of the most dangerous means of spreading the infection if it is taken into the soil where the conditions favor the development of the spores. In burying carcasses a useful precaution is to cover them with quicklime.

Where the bodies are burned instead of buried great care should be taken to see that the operation is thoroughly done. Even the earth upon which the carcass has lain should be thoroughly and deeply burned over so that the heat will penetrate to a depth sufficient to kill the germs that may have passed into the soil with fluids from the body.

## Pure Breds Pay

Written for California Cultivator by A. M. Nelson

WARDS by the American Jersey Cattle Club for 1916 records have just been made, the only medal going to a Californian being that to Frank H. Vanderpoel, a director of the Imperial County Farm Bureau. He has received a gold medal in class one, being for "superior dairy performance in one year with calf," by Fern Silver Ray, who finished an official test with 700.72 pounds of butter fat. In order to qualify for class one,

cows must drop a living calf carried at least 155 days during the test period.

In this classification Fern Silver Ray ranked twentieth among the cows of the country. She had a butter rating of 824.37 pounds and there were but six cows higher than the 800 pound class. Fern Silver Ray is continuing on official test. She started on January 17 and is now 50 pounds ahead of her record for a similar period last year. In March she gave

90.1 pounds of butter fat. The highest month of last year's test was 81.28 pounds.

Mr. Vanderpoel says Fern Silver Ray's showing is evidence of the favorable feed and climatic conditions of the Imperial Valley for dairy cows. The record last year came within two pounds of the state Jersey record and was remarkable in that Fern was given ordinary ranch feed and had no shelter other than cottonwood trees in the barnyard. Last year Mr. Vanderpoel had but five pure bred cows and these gave an average of 567.14 pounds of butter fat. The 566 five-year old cows which were entered in the Jersey lists last year for Register of Merit produced an average of 487.33 pounds, or 59.81 less than Vanderpoel's average and he points to this showing as another evidence of the valley's excellence as a dairy country.

## Keeping the Milk

Two conditions are necessary for keeping milk and cream sweet—cleanliness and low temperature. Souring is due to germs so small that 25,000 can lie on the head of a pin, yet these germs double in number every 20 minutes in warm milk. Starting with one, in 20 minutes there will be two; in 40 minutes, four, and in one hour, eight. This rate kept up would develop enough offspring from one germ to fill the Atlantic ocean in five days.

These germs exist in the filth on the cow's body and in the barnyard and stable, in the dust in the feed and in unclean dairy utensils. A very small piece of manure, falling from a cow's flank into the pail of milk, contains several million of these filth germs, and they start propagating the

moment they touch the warm milk, doubling every 20 minutes. Dusty feed, stirred up just before the cows are milked, furnishes tens of thousands of these souring germs, ready to fall into the warm milk in the pail.

The cow should be kept clean and milked in a clean place, and should not be fed until after being milked. It is a good plan to dampen udder and flank slightly just before starting to milk. This will prevent dandruff and dirt, with their millions of souring germs, from falling into the milk.

All tinware touched by the milk should be first washed in lukewarm water, then in water that is boiling, and afterwards thoroughly exposed to the sun. When a milk pail is first washed in boiling water the heat coagulates the milk left in the seams and the coagulated milk stays in the seams, protecting underneath it mil-

lions of germs that spread through the warm milk at the next milking. Smell a milk pail that is not washed in lukewarm water first, and the foul odor will convince you that there are plenty of germs in the seams. All the milk in the seams soaks out when lukewarm water is used for the first washing. The boiling water that follows sterilizes the pail and sunlight is sure death to all germ life.

Milk from a clean cow, drawn in a clean place, into a clean covered pail is nearly pure. A few germs will always get in. To keep these few from increasing and turning the milk sour, chill the milk from each cow as soon as you have finished milking.

At bloodheat the souring germs double every 20 minutes; at 40 degrees they do not increase at all and many die; at 50 degrees they increase so slowly that clean milk held at this temperature will keep sweet five to eight days. Milk coolers can be bought cheaply, and with these each separate drop of milk is thoroughly chilled as soon as it passes over the cooler.

## Dairy Profits Can Be Made as Certain as Tomorrow's Sun by Cutting Down Feed Costs. This Machine Will Help You Do It.

### THE LIGHT RUNNING

## ACME FEED CUTTER AND SILO FILLER

BUILT IN SEVEN SIZES, CAPACITIES 3 to 30 TONS PER HOUR

Use this machine to fill your silo and then throughout the year in cutting dry feed and making alfalfa meal. Why buy a cutter that can only be used for silo filling when the same money invested in an Acme Combined Silo Filler and Feed Cutter will yield big returns at all seasons of the year.

#### SILAGE AND SILO FILLING

The ensilage cutter, in connection with a good silo, provides the means of utilizing to the fullest extent and in the most economical manner the FULL FEED VALUE of the entire crop, including grain as well as forage. To get the full value out of your silo you must have a good cutter. The Acme Ensilage Cutter, with the downward shearing cut of its knives produces a clean, evenly cut silage that packs well and keeps properly in the silo. It cuts everything—alfalfa, soy beans, cow peas, sorghum, Kaffir corn, Egyptian corn, milo maize and corn.

#### The Acme is the Only All-Steel Frame Cylinder Cutter on the Market

The Steel Frame is securely riveted—no bolts to jar loose. It can't warp as does the old-style wooden frame. All bearings and shafts are held in permanent alignment. Vibration and wear are reduced to the minimum. We fully guarantee every Acme Cutter.

BUY AN ACME NOW AND HAVE YOUR CUTTER ON HAND WHEN YOU NEED IT

Send for Complete Catalog

It describes and illustrates each of the 7 machines.

**DE LAVAL DAIRY SUPPLY CO.**

EVERYTHING FOR THE DAIRY

61 BEALE ST.

SAN FRANCISCO, CAL.

#### CUT DOWN FEED COSTS BY CUTTING UP YOUR DRY FEED

Cutting up your dry feed will make it go about 25 per cent farther in the feeding of stock. The coarse hay is usually nosed out and discarded by the animal. By cutting all the hay the entire amount is consumed as feed, and less energy is expended by the animal in chewing and assimilating it. With alfalfa valued at \$16.00 per ton this will mean a saving of \$4.00 per ton. If molasses is mixed with cut feed, more of it is eaten, with consequent better results in beef and milk production. Full information on cutters fitted with molasses mixer gladly mailed on request.

#### MAKE YOUR OWN ALFALFA MEAL WITH AN ACME CUTTER

The Acme Alfalfa Meal Attachment enables the making of an excellent grade of meal from alfalfa hay, clover, bean straw, pea vines, oats or barley, hay, milo maize, Kaffir corn, Egyptian corn, at a cost for power and labor of about \$1.00 per ton. Alfalfa meal mixed with skim milk or butter-milk and let stand 12 hours before feeding will produce growth in stock hogs at less expense than any other feed or combination of feeds known. The alfalfa meal attachment is operated independently of the blower and can be attached in 15 minutes' time.

Send for free sample of alfalfa meal made with the Acme Meal Attachment.

Send me, without obligation on my part, the books I have checked.

# HOGS & CATTLE

1800 Head of Pure Bred Live Stock

MAMMOTH CREDIT

## Auction Sale

OF THE STOCK OF THE WELL KNOWN  
CHAS. W. BRYSON RANCH

ANGIOLA, TULARE COUNTY CALIFORNIA

Santa Fe Cars take you direct to Ranch, 6 miles South of  
Corcoran, 18 miles West of Tulare

### SATURDAY, JULY 28

PROMPTLY AT 10 A. M.

This will be one of the Largest Sales of Pure  
Bred Hogs and Registered Cattle ever  
held in the San Joaquin Valley

### Big Barbecue and Free Lunch at Noon

I am instructed to sell 1800 head of Pure Bred Hogs and Cattle. Stock consists in part, as follows:

Fifty head Pure Bred Boars, Duroc-Jerseys, Yorkshire and Poland China; 700 Gilts; 400 Shoats; 300 Sows with Pig; 200 Sows with Litters; 120 head Feeders; 30 head Registered Durham Bulls; 25 head Registered Hereford Bulls; 25 head Registered Hereford Heifers.

Every Rancher in the Valley should avail himself of this opportunity to get this Pure Bred Stock at your own prices. This stock is all bred in the Purple and will positively be sold to the highest bidder and must be seen to be appreciated.

The Chas. W. Bryson Ranch at Angiola, California, is over-stocked with pure bred, registered, or eligible for registration, HOGS AND CATTLE. The foundation herd was placed on this ranch at great expense, pure bred gilts and boars were purchased in the East and Middle-West, from the best known breeders in America, Duroc-Jerseys from Chas. Stith of Eureka, Kansas; Yorkshires from the premier herds of W. F. Fisher of The Cedars, Columbus, Ohio, and Thos. H. Canfield of Lake Park, Minn.; registered Poland-China boars from Linquist Bros., and John Kincaid of Bakersfield; Brookside Farm of Stockton, and Geo. V. Beckman, of Lodi, Cal. These boars and gilts were selected especially for the foundation herd on the Bryson Ranch, no expense being spared in the selection of this stock, which was shipped across the country to the Bryson Ranch where they were raised and bred with scrupulous care.

The bulls and heifers are thoroughbred of the Hereford and Durham strains, in fact all of the stock on the Bryson Ranch are "bred in the purple," the purest strain that flows through the veins of aristocratic thoroughbreds is found on this ranch, and "blood tells" in hogs, in cattle, and in all other stock.

We are not selling "pork" at this sale, but we are selling just what we advertise, pure bred hogs and cattle. THE BRYSON RANCH IS NOT GOING OUT OF THE STOCK BUSINESS, but going into it on a larger scale than ever; we want to help make the San Joaquin Valley the greatest hog and cattle raising valley on the Pacific Coast, we want every farmer to start hog raising. We are over-stocked, we want you to start in right. No one man can buy these herds, they are going to be sold, in small lots, to hog and cattle raisers, and every farmer should breed thoroughbreds, pure, or cross them to suit his fancy. Hog and cattle raising is a necessity. Pork prices are the highest ever known. Look out for "twenty dollar a hundred pork" this fall. The world is short of pork, which is a necessity, not a luxury.

COME TO THIS SALE, buy some thoroughbreds and start RIGHT and NOW, nothing should go to waste on your farm, feed it to hogs and into the bank. Men are growing rich in the stock business, why not you? When you see these thoroughbred mothers with their litters, "bred in the purple", you will buy them and breed them again and you will be amazed at the results. Let nothing keep you away from this pure blood stock sale and you will come again.

**Terms** All sums under \$100 to be Cash. Over that amount 60 days time will be given on approved Bankable Paper, at 8 Per Cent or 2 Per Cent discount for Cash.

promptly at 10 a. m.

## Field Notes from the Live Stock Men

The final shipment of T. T. Miller's great herd of Shorthorns arrived from Chicago last week, completing one of the very highest class herds of registered beef cattle in the West. Mr. Miller was fortunate in securing Andy Simpson from Bellows Brothers, Missouri herd to handle and fit his cattle for the fall fair circuit.

California Polytechnic School, San Luis Obispo, has in Susy's St. Mawes one of the grandest young bulls of the Jersey breed. The school purchased this bull from Ed Carey, the noted Oregon breeder, last winter as a yearling, and at 28 months he is fulfilling expectations. Mr. Hemmerich, the dairy superintendent, has bred this bull to 13 head of his finest heifers, including two daughters of Marquis Foxy Belle, the former state record cow who made 756.11 pounds butterfat in a year. This bull's sire was Poppy's St. Mawes, and his dam, St. Mawes Susy, a cow that ranks among the world's best Jerseys, with the remarkable yearly record of 1190.3 pounds butter from 15,732.4 pounds milk at ten years of age. He is a fine individual and will be a candidate for championship honors if he is exhibited this fall.

W. T. Sesnon, the San Francisco millionaire who has extensive cattle interests along the California coast, reports his bunch of registered Hereford heifers doing finely under range conditions. This lot of stuff was brought from Missouri shortly after the close of the world's fair and is the foundation with which the owner plans to produce his range bulls. The herd bull is a line bred Don Carlos, Anxiety bred animal of high merit and is giving splendid service. His name is Demonstrator and he was purchased from Harris and Sons. The "White Face" cattle are making rapid strides in the favor of California cattle men.

Vall and Gates recently shipped a trainload of grade Hereford steers to the Kansas City market, which weighed 1380 pounds on board cars and were said to be the heaviest bunch of grass beef ever shipped from California. They were ranged on the Santa Rosa Islands off the coast of Santa Barbara.

Jackson Lowe, San Luis Obispo County cattleman, has been buying quite a bunch of pure bred Shorthorn cattle for his range. He has about 4000 acres of fine range which is covered with a wealth of feed which is abundant even this year when the coast pasture is unusually poor.

The big Rodeo at Salinas the past week was the biggest and best ever. This is an event in cattle circles every year and the boys gather from far and near to witness the great sport furnished by the cow boys and to talk over cattle affairs.

Norman Hale is getting the Pacheco Cattle Company's herd of Shorthorn cattle in San Benito County ready for the fairs, and they are nearly ready to step into the show yard and worry the judge. The Hawkins entry will be hard to beat this year, especially in the young stuff. Here is a remarkable herd of beef cattle which has been bred entirely by Mr. Hawkins along practical and utility lines, and demonstrates both the ability of the breeder and the ideal environment of our California hills for the production of beef animals.

The Barco Ranch in San Benito County is developing a nice bunch of red, roan, and white calves. It will be

remembered by fair goers last year that the Barco Ranch yearling heifer won grand championship honors and its other entries finished well up in the money. The ranch will probably not show this year as the cattle will not be ready in time.

C. T. Colombet and Son of Santa Clara County have been selling large numbers of Hereford bulls to the range cattle men. They brought over 1100 head from Texas the first of the year and after selling this big lot off brought in a couple of hundred more. This stock is pure bred but not registered, the class of stuff most of our California cattle men have been asking for, and as the quality of the Colombet stock is of the best their repeat orders have been large. If the average run of our cattle men would use better judgment in selecting bulls to run with their herds in the mountains we would have an improved quality of beef.

With a 12,000 acre cattle ranch in Lake County and another of 36,000 in Monterey County R. S. McCreery of San Francisco ranks among our largest operators. He likes the Shorthorns and has been using good bulls for a generation.

Paicines Rancho, San Benito County has what is considered by cattle men as fine a herd of Shorthorns as can be found in the entire country. It is a matter of regret that this concern does not fit a show herd each year so that the public would have the opportunity of seeing these cattle. D. J. Stollery, the sales manager of the Paicines cattle, has been at the business end of this herd for years, and system in breeding, feeding, and selection is found here at its best. All the registered cows are hand bred to the best American and imported bulls obtainable. Probably the reason for the wealth of bone and scale in the Paicines cattle is that the breeding cows have never been pampered for show purposes; they are not put through the strain of fitting and letting down. The same is true of the bulls. The Imp. six year old senior herd bull, Champion of Scotland, would be hard to duplicate anywhere, while there are a number of other bulls of equal quality. One could close his eyes and pick out a hundred females which would be hard to match. The proof of the individuality and breeding is in the calves and in the ever broadening market for the Paicines product.

A meeting of the California Shorthorn Breeders Association is scheduled to be held in the office of the secretary, D. J. Stollery, San Francisco. Every Shorthorn man in the state should try to arrange his affairs to attend this meeting. "In union there is strength," and the more members in an organization working for the common good of the breed, the stronger and greater its influence.

### ATTRACTIONS AT STATE FAIR

AMONGST the attractions at  
the State Fair at Sacramen-  
to, which opens September  
8 will be a temporary struc-  
ture 150x100 feet to house

the county and fruit exhibits. This  
will take the place of the Horticul-  
tural Pavilion which was burned last  
year.

The famous Yakima herd of Aber-  
deen Angus cattle from Eastern  
Washington may be seen at the Cali-  
fornia State Fair this year. There will  
be a number of high class county fairs  
in California this year, and as the  
dates have been arranged to allow  
time for shipments, many herds of  
live stock will be seen throughout the  
circuit.

The showing of poultry, pigeons,  
and pet stock will excel any previous  
effort in this line. The California  
Pigeon Club members have already  
taken steps for a proper show of their  
birds.

The dairy cattle division this year  
will make the strongest showing on  
record. Additional show sheds will be  
erected to accommodate this stock.  
Many prominent breeders have asked  
for reservation of stalls, and the ani-  
mals shown will equal the best seen  
in the country.

The swine breeders of the state  
have made such demands for space at  
the coming fair that Secretary Paine  
has a force of carpenters erecting  
four new swine sheds. The porker is  
king in the solution of the meat food-  
stuffs problem, and the thousands or  
more pure bred hogs at the fair will  
be an exhibit worth seeing.

The Pacific Coast Hereford Cattle  
Breeders' Association, which was or-  
ganized at the University Farm at  
Davis in May, has aroused much in-  
terest among the followers of the  
"White Faces." A number of leading  
Hereford breeders have commenced  
to fit their stock for the state fair to  
compete for the premiums offered by  
the state and the liberal special prizes  
to be given by the national associa-  
tion. The exhibit of Herefords will  
be the best seen at the state fair for  
years, if not the best ever seen there.

### CONSTRUCTIVE METHODS

The broad course adopted by the  
American Shorthorn Breeders' Asso-  
ciation two years ago, intended to  
further support and safeguard the in-  
terests of every breeder of Short-  
horns, is having a definite, construc-  
tive effect wherever Shorthorns are  
being produced. It should not be un-  
derstood that the general policy of the  
association has been any other  
than progressive for many years, but  
the larger conception of the needs  
and opportunities by the present  
board of directors and officials has  
enlarged the scope of the associa-  
tion's purposes and influence.

It is a strong army of men, 25,000  
in number, who are breeding and re-  
cording purebred Shorthorns, and the  
progressive methods employed by the  
association are reflected in the con-  
fidence and enthusiasm of this nu-  
merous and prosperous host, and  
through them activity is stimulated  
among the infinitely larger number,  
producers of grade Shorthorns.

Appropriations for fairs and shows  
were increased to include futurity  
classes and numerous state associa-  
tion combination shows and sales, ag-  
gregating over \$50,000 annually.

A publicity bureau was inaugurated  
for the purpose of furnishing reliable  
information concerning the breed's  
affairs and progress, the main fea-  
ture of this being the quarterly pub-  
lication, "The Shorthorn in Amer-  
ica." This 48-page magazine presents  
contributions from recognized author-  
ities in all parts of the country. It  
is beautifully illustrated and is one  
of the most informing and readable  
publications of its class. The July  
1st number, just off the press, com-  
mends itself as one of the most in-  
teresting and instructive yet issued.

# 2nd Annual Sale BERKSHIRES

**CARRUTHERS FARMS  
MAYFIELD, CALIFORNIA**

**WEDNESDAY  
AUGUST 1st**

1917

Sows are bred to Ames Rival 100, son of Rival's Champion Best;  
Iowana Rival Majestic 3d, a son of Rival's Champion; and Mayfield  
Champion, son of Ames Rival 70th.

## 44 Sows and 6 Boars

In this sale will be included ten sows and two boars, comprising the  
best show herd that has ever left Carruthers Farms.

## Entire Show Herd will be Sold

## Elliott-Brant Rancho Guernseys Are Persistent Producers

The results of our first two years of official testing show our herd to  
average 10,172.28 Pounds of Milk and 507.97 Pounds of Fat. One half of these  
cows were heifers with first calf who averaged 8,670.24 Pounds of Milk and  
436.01 Pounds of Fat (only 7 pounds under the average of all A.R. records).  
Our mature cows averaged 12,710.5 Pounds of Milk and 621.52 Pounds of Fat  
(120 pounds over the average of the mature cows of the breed).

A bull from these cows will increase the production of almost any herd.

**Elliott-Brant Rancho, - Owensmouth, Cal.**

## KINGS COUNTY

### JACK RANCH

Breeders and dealers in American  
Jacks and Jennets.

Jacks and Jennets for sale at all  
times. Come and see them.

R. F. D. B. Box 74

Hanford, Kings County, Cal.

California Wonder

## Tulare Guernsey and Holstein Farm

Guernsey herd of A. R. cows headed by  
DAIRYMAID'S PRINCE 26352, whose  
sire is a son of Dairymaid of Pinehurst,  
A. R. record 17,235 pounds milk and 910  
pounds butterfat in one year. His dam is  
POLLY'S BEAUTY, A. R. record 16,629  
pounds milk and 774 pounds butterfat in  
one year as a 4-year-old.

CHOICE BULL CALVES OF

Holstein herd of choicely bred females,  
many with good A. R. O. records, headed  
by PRINCE RIVERSIDE WALKER,  
whose sire is Prince Gelsche Walker, and  
whose dam is Aaggie Acme of Riverside,  
808.82 pounds butter in one year, and she  
has a 3-year-old daughter that made  
1095.1 pounds butter in one year.

BOTH BREEDS FOR SALE

W. J. HIGDON

TULARE, CAL

# BUYING A DE LAVAL SEPARATOR NOW

## Is real thrift and genuine economy

"THRIFT" means saving wisely. "Economy" means spending wisely.

There is no economy in going without money-saving and labor-saving equipment.

It is poor economy to try to do without a De Laval Cream Separator—a machine which would not only save a lot of time-wasting work, but would add from 15 to 25 per cent to your cream crop by putting a stop to your butter-fat losses.

This country is at war. The nation cannot afford, and you as an individual cannot afford, to allow the present enormous waste of one of our most valuable foods—butter-fat—to continue an unnecessary day.

See the local De Laval agent today. Get him to explain to you how the De Laval saves butter-fat that is lost by gravity skimming or the use of an inferior or half-worn-out separator. If you do not know the De Laval agent, write to the nearest De Laval office for new catalog or any desired information.

Every New De Laval is equipped with a Bell Speed Indicator.

## DE LAVAL DAIRY SUPPLY CO.

LARGEST DAIRY SUPPLY HOUSE ON THE PACIFIC COAST. Alpha Gasoline and Distillate Engines, Ideal Green Feed Silos, Acme Ensilage Cutters and Blowers, Irrigation Equipment, Centrifugal and Deep Well Pumps and Alpha Spraying Outfits. Send for special catalog.

## Rhoades & Rhoades

Expert Live Stock Auctioneers  
Pure Bred Stock Sales a Specialty  
Sales conducted in all parts of California and Adjoining States. 25 Years' Experience.

BEN A. RHOADES, Auctioneer  
1301-3-5 So. Main St., Los Angeles, Cal.

## Berkshire Hogs—Milking Shorthorns

Breeding Stock For Sale  
G. A. Murphy - Perkins, Cal.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

## Kill Disease Germs Purify the Air

## Dr. Hess Dip and Disinfectant Means Animal Health

Use about the barn, pens, chicken yards; use at the house on garbage cans, sinks, drains, cesspools. It cleanses and purifies—keeps down bad odors and smells and destroys disease germs. Dip your sheep to eradicate scab and kill ticks. Dip or spray hogs to kill lice.

### Sold on Money-Back Guarantee

Pint bottles, quart, half-gallon and gallon cans and barrels.  
Dr. Hess Fly Chaser protects animals from flies. Does not gum, blister or discolor hair.

If not at your dealer's, address

DR. HESS & CLARK, Ashland, O.

## COW TESTING IN ARIZONA

Continued from Page 51

realize that his herd was not producing as much as his neighbors' was naturally a little jealous and afraid that his neighbors would find it out, and it required no little tact to keep his enthusiasm up to the 100 per cent mark. So all in all the difficulties of the tester in a new and rapidly growing dairy section are far greater than in the older and more staid dairy communities.

In the personnel of the two young men the Salt River Valley dairymen were peculiarly fortunate, for both of them in addition to their agricultural college training had been brought up on farms in the Southwest and therefore had experience in the work which was being done on the farms as well as their own work of testing the herds. They were both tactful, one of the most valuable assets of any man who must come in contact with a large number of men, whether they are farmers, lawyers or laborers in factories or mines. I have seen numbers of agricultural teachers and agents that have failed because of lack of that peculiar ability to read and understand human nature which we call tact. Without that characteristic there would be no cow testing associations in the Salt River Valley today, and these young men would not have been advanced to more responsible, better paying positions of larger usefulness.

To the ability of these young men is due almost entirely the credit for completing the first year's work with credit and signing up the owners of 85 per cent of all the cows that finished the test, collecting all back dues and securing new members to take the place of the few that sold or dropped out for some other reason. The associations were therefore turned over to their successors stronger than ever before.

The herd records revealed nothing especially remarkable. One herd made a record of 328.6 pounds butter fat for each cow. Several cows produced more than 400 pounds of butter fat; one cow produced 12,448 pounds of milk. Good records, and particularly so as little or no grain was fed. The average herd profits for each cow run from \$26 to \$150, counting only the feed against the product. The last figures are from a dairy that retailed milk. One herd of 15 cows from which cream was sold as sour cream returned \$52 above the cost of feed. One dairyman who made butter and sold it wholesale had a profit of \$83 for each cow over the cost of feed.

The testers were not satisfied with merely the work of weighing the milk and figuring out the totals. This was a small part of their work, although that of course was what they were paid to do. In tactful ways they taught better methods. By figures and logic they proved the value of better stock, better equipment and the advantage of silos. As proof that their work was practical they can show eight new milking barns erected during the past year; four silos have been built and at least two more will be built soon; three new milking machines have been installed, making eight now in successful operation.

The testers probably earned their salaries in the one item of keeping the hand separators in good working order. Most dairymen sell cream which is gathered by trucks sent out by the creameries, and consequently there is a hand separator on nearly every dairy farm. Many dairymen

unfortunately are not mechanics and give the separator very little attention. It is not surprising therefore to find many separators not properly adjusted. The testers took samples of the skim milk at each farm once each month and tested it at once. If the test revealed too large a loss the separator was at once inspected and the necessary adjustments made. The saving effected in this way is of course impossible to estimate, but as some of the samples showed a high test the loss prevented is necessarily large.

Early in the work the testers realized that they were at a serious disadvantage in having no means of conveyance, except the dairymen who were often busy, so out of their salaries, which by the way were by no means large, they bought Fords. The members of the associations were willing to pay for the gasoline. With these machines they were able to pack all the necessary equipment, such as scales, extra bottles, Babcock tester and their personal belongings, and move on to the next dairy farm whenever the work was completed. This resulted in not only a saving of time all around and consequently better service, but it made it pleasanter for the testers and more convenient for the dairymen.

There was another feature of the advantage of the Fords which should not be overlooked. In this Western country, which has been reclaimed from the desert within the past few years, there is on many farms a lack of the conveniences found on some of the farms in the Eastern states. In this mild climate cows and hired men sleep out of doors all the year. Most dairymen tried to give the testers the best they had, the best room as well as the best of food, but in many instances, particularly among tenant farmers where houses are small, it made it inconvenient and resulted in a hardship to the dairyman's family. To overcome this the Ford was slightly remodeled. The back of the front seat was hinged and could be dropped back. With a canvas side tent and a roll of bedding this made a very comfortable sleeping place, and saved any annoyance to the housewife or embarrassment to the tester.

The first year's work has been completed with credit, and the second year's work has been taken up by two other young men from the state college of agriculture. The two testers are advanced to larger and broader fields where their ability, training and experience will be more useful to the state and more remunerative to themselves. Mr. Pickrell has been selected as the agricultural agent for Pima and Pinal Counties, and Mr. Scheerer goes to Yavapai County for the same class of work. The year's training as testers was a severe test, but no training for their present work could have been better.

## MILK FEVER

Often the heaviest yielding cow in the herd will be suddenly stricken, fall and soon become unconscious. This is milk fever, and unless prompt treatment is given results in sudden death.

Thoroughly sterilize a common bicycle pump in boiling water, connect the tube of the pump with an ordinary German silver milking tube that is inserted full length in the teat. Fill the quarter of the udder with all the air it will hold, gently manipulating the flesh. Do this with each teat and repeat the process. Cows that show no signs of consciousness will frequently get up after an hour of this treatment and go to eating and not again show signs of ever having been sick.

## Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 31,000 readers, weekly.  
Liner rates: Single insertions 3c per word;  
yearly contracts 2½¢ per word. 35c per issue minimum charge.

### TREES

Here is Your Opportunity to Secure All citrus trees. We offer several thousand 2-year-old lemons; Eureka and Villa Franca, also Washington navel; also several hundred Valencia on sweet root. We call these good trees and we know whereof we speak. ALBERT JACKSON, Upland, Cal.

By Far the Lowest Priced means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator. The cost is only 3 cents per word per issue, with a minimum of 35 cents.

For Acacias, Avocados, Budded Loquats, Citrus trees, Evergreens, Feijoas, Palms, Roses and all kinds of trees, shrubs, vines, etc. Write for our new catalogue. Robertson Nurseries, Fullerton, Cal.

Eureka Lemon Trees—Best quality. Fine root system. No frost trees. Grown at San Dimas. Special low price. Smith Citrus Nurseries, 320 Marsh-Strong Building, E. 2729, Los Angeles.

Citrus Trees—All kinds, any quantity. Butler's Morning Side Nursery, Laramanda Park, Cal.

Avocado Seedlings, in flats. Write for prices. Newberry-Sherlock, R. D. 2, Pasadena, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

"Eastman's Bred-to-Lay" Barred Plymouth Rocks. Fairmead Poultry Farm, Fairmead, Cal.

### MISCELLANEOUS

Slacked Lime—Send for sample and information. Price right. Let me help you. H. B. Matthews, 350 Woodberry Road Pasadena.

To Reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

Send One Dime, receive 25 cent cake best skin and scalp soap, postpaid. Healing Soap Co., 1704 Oregon St., Berkeley, Cal.

### RABBITS

Raise Rabbits For Us—We sell you foundation stock and buy back what you raise, paying \$1.75 and \$2.00 each for them. Send 25c for our proposition, our book on rabbit culture and our supply catalog. Gilmore's Rabbit Farm, Dept. C, Santa Barbara, Cal. (The rabbit farm of international reputation.)

### HOGS

Chester Whites, the Billiken Brand.—Your duty is to raise more hogs and increase the meat supply. The demand for pork exceeds the production. Get started with some of these Chesters; 3 bred sows farrowed in April, 1916, due to farrow in September, and October; 18 October gilts bred to farrow in October; 3 October boars ready for service. All first class in every respect and good enough to fit and show at the different fairs this fall. All are cholera immune and will be registered free. Write for price list and booklet. C. B. Cunningham, Box C, Mills, California.

Grape-Wild Farm Berkshires—World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Large Yorkshires—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

Superba, World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington, Sta., Riverside, Cal.

Rancho Rubio Durocs. Only a few September gilts left. One carking good fall boar by Orion Model, son of the last International grand champion. Place your orders now for weaned boar pigs. Best I ever raised. Elmer Lamb, Ceres, Cal.

Wanted—Farmers, orchardists, livestockmen to use classified liner advertisements like this. Thousands of people read every ad and the cost is only 3 cents per word per issue, minimum 35 cents. Extra lines of white space above and below cost only 16 cents per line.

Duroc Jerseys—Grand Golden Model is sired by the Champion Grand Model. His dam is by Golden Model 2nd. Peters, Lamson & Walker, Devore, San Bernardino County, California.

Big Type Durocs. Well grown out February and March pigs of either sex in any quantity. We ship only the tops and butcher the culls. F. M. Johnson, Napa, Cal.

Cholera Immune Duroc-Jerseys. Big type. Weaned boars and gilts from 500 to 700-pound sows. Prize winning stock. Derryfield Farm, I.O.O.F. Temple, Sacramento.

Crawshaw's California Chinas are prolific and profitable. Weanlings \$15.00, boars \$25.00. Dr. J. A. Crawshaw, Hanford, Cal.

Poland-China Swine Recorded. Stock for sale at all times. We please you or refund your money. W. A. Young, Lodi, Cal.

Most Money In Duroc-Jerseys. Bred sows and weanlings, either sex all the time. Delta Farm and Live Stock Co., Colton, Cal.

Choice Boar Pigs for Sale. Sired by Superba 220620, champion Poland boar at San Francisco. Prices right. C. R. Hanna, Riverside, Cal.

Large Yorkshires—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

One Large and two medium type boars, extra choice, 9 and 10 months old. W. Bernstein Ranch, L. C. Trewitt, Mgr., Hanford, Cal.

Tepary Beans for Sale—Twelve pounds will plant an acre. Will mature in 65 days from seeding. Seed very scarce. We have on hand a limited quantity which we offer, ten pound lots at \$2.50; hundred pounds \$20.00 F. O. B. Tucson. Tucson Seed Company, Dry Climate Seeds, Tucson, Arizona.

\*\* ORDER YOUR SEEDS NOW \*\*  
If you are going to need any seeds for next season now is the time to render your orders. It may be impossible for you to buy what you need later. V. A. Peterson Alfalfa Seed Co., Arbuckle, Cal.  
\*\* ALFALFA SEED OUR SPECIALTY \*\*

Six Sacks Sudan Grass Seed—Absolutely pure. For quick sale 40 cents per pound. Imperial Valley Seed House, El Centro.

### MONEY TO LOAN

Money to Loan—On improved farms, city property or for building loans, also on cattle or cotton crops. C. G. Paul, 204 North Glendale Ave., Tropic, Cal.

A new cheese factory has been erected at Patterson, Stanislaus County.

### Book Review

#### "PRODUCTIVE PLANT HUSBANDRY"

"Productive Plant Husbandry," by Kary C. Davis, Ph.D., professor of agriculture, Cornell University, published by J. B. Lippincott Company, Philadelphia, \$1.75 net.

This is a textbook for high schools and covers the subjects of planting, propagation, plant breeding, soils, field crops, gardening, fruit growing, fertilizing, insects, plant diseases and farm management. There are 312 illustrations in the 462 pages, and while it is a textbook for schools it is a book in which there should be great interest on the part of up-to-date farmers. In the preface we note:

"A glance at the table of contents will show that this book treats, first, the subject of plant life and growth, and methods of improving plants. A preliminary study of botany is not essential to the understanding of these lessons. Soils and their improvement and maintenance are next considered. The treatments of the various farm crops, including fruits, vegetables, field crops and forestry, are given in much more detail than in texts which attempt to include also the study of livestock. The latter is omitted from this book except as it enters into the discussion of the principles of farm management, the business of farming, or the principles of breeding. The enemies of crops—weeds, insects and diseases—are considered somewhat fully. Much emphasis is laid upon the improvement of the home and the community.

"The field and laboratory exercises at the close of each of the chapters are given so fully that it is believed they will be easily understood and may be readily followed."

#### KEEP YOUR CHICKENS!

Can't you look into the future and realize the serious mistakes of those poultrymen who are now disposing of their flocks?

A scarcity of chickens this fall means nothing more than a falling in the production of eggs. That means that eggs are going to sell at higher prices than ever.

That's why we are telling you to keep your chickens. Here is a chance to benefit yourself by the mistakes of others and plan to have laying hens later on when they will not be so plentiful. Fortunately some of the wide-awake, far-seeing poultrymen are holding on to their chickens as they never have before. For them we prophesy a most successful future. Are you one of them?

On account of the apparent high cost of feeds some poultrymen think that no money can be made in the poultry business, but the following experience of the members of the Tulare Cooperative Poultry Association proves otherwise: Assuming that it takes two pounds of wheat, two pounds of bran and two pounds of Surelay to produce a dozen number one eggs, this mixture in 1916 cost—Wheat \$.032; bran \$.035; and Surelay \$.05; total \$.117. Eggs were selling for \$20 a dozen, leaving a profit of \$.083 per dozen. This same mixture the past May cost—Wheat \$.085; bran \$.05; and Surelay \$.0625; total cost \$.1975, to produce one dozen eggs. Eggs in May sold for \$.31 a dozen, leaving a margin of \$.1125 per dozen, or nearly \$.03 more profit per dozen than the 1916 eggs netted.

Could anything be more convincing? Aren't these sufficient reasons for you to want to keep your chickens, and can't you well imagine what the future profits will amount to? Therefore, it is to your interest to retain your fowls, not only from a money making standpoint, but also to show patriotism in this hour of need when the world is crying for food.

#### A KNOWLEDGE OF MACHINERY

Just as the little boy should learn to read and write so should the big boy learn to work with machinery. This is a mechanical age and there is a big demand for skilled machinists. The salaries paid are particularly good and will continue to be so for years to come. The opportunities are many and varied and mechanical positions lead to some of the big engineering achievements. The possibilities are limited only by the scope of one's ability.

The Polytechnic College of Engineering at Oakland is fully equipped to prepare young men to hold good, well paying positions in mechanical lines. The demand for skilled mechanics is always greater than the supply.

A catalogue issued by this school gives full information concerning the course, the cost and the opportunities. It will be mailed free for the asking. Mention the Cultivator and get one.

### THINGS THAT COUNT

Not things we have, but what we use;  
Not what we see, but what we choose—  
These are the things that mar or bless,  
The sum of human happiness.

The things near-by, not things afar;  
Not what we seem, but what we are—  
These are the things that make or break,  
That give the heart its joy or ache.

Not what seems fair, but what is true;  
Not what we dream, but the good we do—  
These are the things that shine like gems,  
Like stars in fortune's diadems.

Not as we take, but as we give;  
Not as we pray, but as we live—  
These are the things that make for peace,  
Both now and after time shall cease.  
Selected.

### MY TRUSTY HELP

Written for California Cultivator  
By Mrs. A. Stainton

**B** EING a practical housekeeper having the same daily problems to solve that you have, has taught me the value of a fireless cooker.

No woman who has not used a fire-

less cooker can begin to realize what it will mean to her to have one of them, and especially during the hot months. It is such a relief to get away from the hot stove and out into the garden or on to the shady porch, knowing that while you are cool and comfortable or busy with other duties the cooker is cooking the food perfectly, that there will be nothing burned, overdone or spoiled.

All cooking is done by the application of heat in some form. The fireless cooker is not a generator of heat, neither does it provide a place where heat can be generated. It is just a contrivance to conserve heat that has been produced elsewhere. On the same principles that the cooker conserves heat, it conserves cold also. The advantages of cooking certain articles by long continued slow process is well known to practical cooks and right here is the usefulness of the fireless cooker.

When it comes to canning time the cooker means hours of release from standing over the hot stove. It means you can put up dozens of cans of fruit and make jams and marmalades that you would not bother with if you had to do it over a hot stove.

The saving of fuel is a big item, but I pass that over and speak of the relief that comes from not having the whole house heated from the cooking. It is easy to keep a house cool, but to cool it after the day's baking is through is not so easy. You know the fruit and vegetables are at their zenith during the busy season, and to can them in the "spare time" always meant one of two things: getting the fruit, etc., prepared and started and then rushing off to other duties only to find on your return the fruit had boiled over on the stove. The kitchen was in a sticky mess, or it was time to start the dinner for the men and the canning had to be left until a few more minutes of spare time, or else you must get additional help and this is not always possible. I gave it up entirely and bought anything I needed. Think of it—a farmer's wife buying farm produce, and time and material on a farm are too valuable to throw away. So I got a fireless cooker. Now whenever I have fruit or vegetables, just a little maybe, only enough for two or three jars, I put it up for my emergency shelf. I don't use a lot of fuel and I do have my own vegetables, etc., when I need them.

There is some misunderstanding about fireless cookers but it is from people who have not used them. A neighbor said to me "Where is the use of a fireless cooker. The food has to be started and I guess you might as well finish it." Of course the food has to be started, but all you do is to get it heated clear through. Then put it in the cooker and forget it. Once cooking has been thoroughly begun it will continue as long as heat is retained, and the food will be cooked better than by the continuous process. It certainly saves the hanging over a hot stove and waiting around in a hot kitchen and that is what tires a woman so much.

Another thing that bothers some women is the browning of foods. All I can say is: the heat is so confined; it is so intense that foods cooked in a fireless cooker brown more regularly than when cooked in the oven. The chief reason why I like a fireless is the freedom it gives. Whenever I want to be absent from home I start the meal to be cooked, put it in the cooker and go out. When I come back I find my dinner or whatever meal I prepared piping hot and done to a turn waiting for me. This alone is worth the price I paid for it. It is so easy. Follow your own favorite recipes. This trusty help never gets tired, nor careless, nor wants to leave, but relieves you of much of your kitchen work, saves fuel and utensils and cooks to a "T."

### SAVE TIME BY WAITING

If the flat irons are not as hot as they should be, stop ironing at once, no matter how anxious you are to finish in a certain time. If you do nothing but sit down and read for a few minutes while the irons are heating, you will be the gainer thereby; for it is a waste of time and energy trying to work with irons that are not hot.

### SOME TIMELY RECIPES

From "Globe Household Helps" issued by the Globe Mills twice a month we take the following timely recipes:

#### Parker House Corn Rolls

Three-fourths cup yellow corn meal, 1½ cups flour, 4 level teaspoons baking powder, ½ teaspoon salt, 1 tablespoon sugar, 2 level tablespoons shortening, 1 egg, ½ cup milk, 1 cup chopped dates. Sift together corn meal, flour, salt, sugar and baking powder; rub in shortening; beat egg well and add to milk; stir into flour; turn out on floured board and knead dates in; roll out and cut; put butter in center; fold over and bake 15 minutes in hot oven.

#### Hot Water Pie Crust

One cup shortening in warm bowl, add ½ cup boiling water, mix well, add 3 cups flour, sifted with ½ teaspoon each baking powder and salt; allow to cool before rolling out. This pie crust is very tender.

#### Delicious Macaroni Salad

✓ Cook one pint macaroni slowly in 1½ quarts boiling water with 1 teaspoon salt about 30 minutes; drain in colander; put into dish; add 1 teaspoon sugar, 1 tablespoon vinegar from can sweet stuffed pickles, 2 teaspoons thick cream, 1 medium-sized, stuffed, sweet pickle; mix well.

Dressing: Yolks of 2 eggs, 1 scant teaspoon powdered mustard, 1-3 teaspoon white pepper; beat, adding a few drops of salad oil at a time until you have used ½ pint of oil; when very thick add 2 teaspoons of lemon juice; beat, adding 1 teaspoon salt; let stand ½ hour; mix 2-3 of it in salad; use balance for garnish when serving. Macaroni must be in small pieces. Sweet pickles can be used.

#### French Cream Cake

One cup white sugar, 3 eggs, 1½ cups flour, 2 tablespoons cold water, 1 teaspoon baking powder; bake in long pan, split while warm and cut into 4 squares, spread hot custard between layers.

Custard: One pint milk, large, 2 eggs, 1 small cup sugar, 1 teaspoon vanilla, ½ cup butter, 2 tablespoons cornstarch. Dissolve cornstarch in little milk; heat rest of milk, when boiling add sugar, cornstarch and beaten eggs, stirring briskly, add butter, stir until dissolved, flavor and spread on cakes while warm.

### NEW WAYS TO USE COTTAGE CHEESE

#### Boston Roast

One-pound of kidney beans or equivalent quantity cooked beans. One-half pound cottage cheese. Bread crumbs. Salt.

Mash beans or put through meat grinder. Add the cheese and enough bread crumbs to make the mixture sufficiently stiff to be formed into a roll. Bake in a moderate oven, basting occasionally with butter, or other fat, and water. Serve with tomato sauce. This dish may be flavored with chopped onions, cooked in butter, or other fat, and a very little water until tender.

#### Pimento and Cottage-Cheese Roast

Two cups cooked lima beans, one-quarter pound cottage cheese, 5 canned pimentos, chopped. Bread crumbs. Salt.

Put the first three ingredients through a meat chopper. Mix thoroughly and add bread crumbs until it is stiff enough to form into a roll. Brown in the oven, basting occasionally with butter, or other fat, and water.

#### Cottage-Cheese and Nut Roast

One cup cottage cheese, 1 cup chopped English walnuts, 1 cup bread crumbs, 2 tablespoons chopped onion, 1 tablespoon butter. Juice of half lemon. Salt and pepper.

Cook the onion in the butter or other fat and a little water until tender. Mix the other ingredients and moisten with the water in which the onion has been cooked. Pour into a shallow baking dish and brown in the oven.

#### Cheese Sauce

One cup milk, 1 tablespoon cottage cheese, 2 tablespoons flour. Salt and pepper to taste.

Thicken the milk with the flour and just before serving add the cheese, stirring until it is melted.

## COMFORT

Cook in a cool, comfortable kitchen this summer. An oil cook stove is comparatively inexpensive to buy and it will soon pay for itself in comfort and lower fuel expense. Meals in a jiffy, and a cool kitchen in summer.

Bakes, broils, roasts, toasts. Better cooking because of the steady, evenly-distributed heat. More convenient than a wood or coal stove for all the year 'round cooking, and more economical.

The long blue chimneys prevent all smoke and smell. In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

## The Cultivator Patterns

8399—Children's Dress. Cut in sizes 2, 4, 6 and 8 years. The dress has a straight lower edge and high or low neck.

8156—Ladies' Blouse. Cut in sizes 34 to 40 inches bust measure. Linen, madras, crepe de Chine or taffeta can be used to make this blouse.

8102—Ladies' Waist. Cut in sizes 36 to 44 inches bust measure. Centre front and front yoke are cut in one.

8400—Misses' Dress. Cut in sizes 16, 18 and 20 years. The dress slips on over the head, has separate guimpe and straight, gathered skirt.

8407—Ladies' Coat. Cut in sizes 36 to 42 inches bust measure. The coat may be made in the 45-inch or 53-inch length.

8147—Girls' Dress. Cut in sizes 6 to 12 years. The dress has a yoke waist and a plaited skirt.

8131—Ladies' Skirt. Cut in sizes 24 to 30 inches waist measure. The skirt is cut in four gores.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

This sauce may be used in preparing creamed eggs or for ordinary milk toast. The quantity of cheese in the recipe may be increased, making a sauce suitable for using with macaroni or rice.

### HELPFUL IN THE HOME

Written for California Cultivator  
By M. A. H.

**W**HEN a housekeeper has learned the art of coloring successfully she can save many a dollar, and this is an art that any one can learn. Children's gingham and muslin dresses are often faded and outgrown when the material is still good, and a good way to lengthen their days of usefulness is to piece them out to make them plenty large enough and then color them a dark blue or brown with a good dye for cotton. Boy's waists and faded housedresses can be renewed in the same way.

A faded straw hat can be made to look like new by squeezing a tube of oil paint of the same color as the hat into a cup of gasoline and stirring until dissolved, then painting the hat with the fluid.

A faded and worn Brussels carpet was given a fresh, new appearance after it had been cleaned and mended by wiping off with vinegar and water and allowing to dry and then going over it with a dark green dye for wool, and this was applied evenly with a large paint brush.

There is nothing more helpful in the home than some good remedies ready for instant use, and among these none are more useful than a bottle of boric solution, or the granulated boric acid can be kept on hand and the solution prepared as needed. This is easily done by dissolving one-half ounce of the acid in one pint of boiled water. When you have a bottle of this solution you have an excellent remedy for sore eyes, sore mouth and for all skin eruptions, and for small cuts and wounds. To keep a child's mouth in a hygienic condition and the gums healthy, wipe the mouth out daily with a soft cloth dipped in the solution, and apply the solution to a child's tender skin after its bath and it will prevent chafing and heal all soreness of the skin. Common alum is another useful article to have in the home. Bathe tender, sensitive feet in alum water. This will relieve the trouble if done every day for several weeks. There will be no trouble from bed sores if a person confined to the bed is bathed with it every day. Weak alum water used as a gargle for a cough will give great relief. Strong hot alum water applied with a brush to the pantry shelves, floors and baseboards will kill all small insects and destroy their eggs and larvae.

### THE BATTLE CRY OF FEED 'EM

Recently the state council of defense, in its publicity propaganda for increased crop production, sent out the suggestion that home guard companies throughout California shoulder a hoe instead of a gun, and that they undertake systematic cultivation of vacant lots in the cities and towns where they were located.

Commending the suggestion and citing President Wilson's declaration that "Every one who creates or cultivates a garden helps, and helps greatly, to solve the problem of the feeding of the nations", Edward Staton, of Fullerton, sent the following poem to Governor Stephens:

#### THE BATTLE CRY OF FEED 'EM

We'll rally round the hoe, Boys, and join the ranks of toil,  
Shouting the battle cry of "Feed 'Em!"  
We'll train the crops to grow, Boys, as tillers of the soil,  
Shouting the battle cry of "Feed 'Em!"  
Where there is work to do, Boys, we'll gather on the spot,  
Shouting the battle cry of "Feed 'Em!"  
To duty we'll be true, Boys, and till the vacant lot,  
Shouting the battle cry of "Feed 'Em!"  
Nature, kind mater, will aid in our need!  
Down with the tater and out with the weed!  
So we'll rally round the hoe, Boys, and train the crops to grow,  
Shouting the battle cry of "Feed 'Em!"

## To Fathers of Boys

This picture shows one section of our large machine shop where many ambitious boys are being fitted for the Battle of Life. They are being trained to use the greatest instruments of human progress—machinery. Good positions await them.

### How About Your Boy?

A six months' course in our machine shop will give him a knowledge of machinery and develop skill so that he may go out as an expert mechanic. THE DEMAND FOR AMBITIOUS AND PRACTICAL MECHANICS IS GREATER TODAY THAN EVER BEFORE.

The indications are that every piece of machinery in this country will be running full capacity and full time for years to come. This is an age of machinery and men who are trained along mechanical lines are to be rewarded with excellent salaries.

# A War Time Poultry Ration

**E. QUISENBERRY**, in charge of the American Egg Laying Contest at Leavenworth, Kansas, writes of a poultry ration which he has found under his local conditions to produce eggs at a feed cost of about 14 cents per dozen. Note that he says: "In some sections you may buy good commercial feed cheaper than you can mix your own." His article follows.

It has been truly said that "Necessity is the Mother of Invention." The present high prices of food stuffs has had a tendency to discourage some poultrymen. But there is no reason why eggs cannot be produced almost as economically now as formerly if the right ration is used, and the selling price of eggs is at least two-thirds more than in former years at this season.

We have been making some tests of various rations on the experimental farm of the American School of Poultry Husbandry at Leavenworth, Kansas, with a view of compounding a ration which would bring the same results and greatly reduce the cost. We realize that available foods and prices vary in different localities so this ration is based upon the feed found in Leavenworth and in the Central States. Grains and ground feeds are constantly varying in price, but at the present time are selling here at the following prices per 100 pounds: Cracked corn, \$3.40; wheat, \$3.67; oats, \$2.50; bran, \$1.65; shorts, \$2.25; beef scrap, \$3.50 and corn meal, \$3.80.

The ration which we are now using in the American Egg Laying Contest and which is producing practically as good results as any we have ever used, which contained a large per cent of wheat, is as follows:

Scratch feed.—Four hundred pounds cracked corn, \$13.60.

Dry Mash.—One hundred fifty pounds wheat bran, \$2.48; 150 pounds wheat shorts, \$3.38; 100 pounds beef scraps, \$3.50; four pounds fine charcoal; three pounds fine salt. Cost of 800 pounds feed, \$22.96. Cost of 100 pounds feed, \$2.87.

If the above feeds are not available it might pay you to have your local dealer import them for you if possible and the prices justify. We have found no other combination that would compare with this ration in price and results. The fact that there is a shortage of wheat, but a large acreage of corn and prospects for an abundant crop indicates that this will be one of the cheapest rations that can be used for many months to come. Whenever wheat is as cheap as corn, wheat should be added to the scratch feed.

The cost of this feed can still be reduced to about \$2.70 per 100 pounds by feeding sprouted oats. We feed equal parts of the above scratch feed and dry mash. For every 100 pounds of the corn chop which is fed we feed one bushel of oats which have been sprouted. Then after they are sprouted it makes over two bushels of feed. We soak the oats from 12 to 24 hours, spread them out in trays until they are about one inch in depth, sprinkle them each day to keep them moist and feed them when they are about one week old. Don't use any artificial heat in sprouting and the oats will not mold. If you feed the oats when they are about a week old from the date you started to sprout them, you get the benefit of the oat grain as well as the tender succulent sprouts. These offset the "all corn"

scratch feed. We feed some of the dry mash in a moistened state each afternoon. Give all the moist mash the hens will eat in about 30 minutes. Moisten it with water or milk. Feed the dry mash in a hopper or box and keep it before the hens so they may help themselves at any time. Feed about an equal amount of the dry mash and cracked corn and regulate the quantity of cracked corn which you throw into the litter for the hens by the amount of dry mash each hen consumes. The nutritive ratio of this feed is about 1:4.5, if the oats are used as directed. This is about right for laying hens or growing stock. This will reduce the cost of this feed at the above prices of the ingredients so that the cost will not exceed \$2.70 per hundred pounds. If this is used for growing stock add five pounds of bone meal to each 100 pounds of ground feed.

On the basis of a dozen eggs being produced on five pounds of feed, each dozen eggs cost us about 14 cents per

dozen when this ration is used. This leaves 21 cents per dozen for labor and profit when eggs are selling at 35 cents per dozen. In the face of these figures there is no reason for any poultryman to be discouraged. If you use this ration at the present prices of eggs you will clear more on your hens than in any previous year because of the increased price of eggs. In the above ration, the succulent oat feed and the wheat products and beef scraps in the mash offset the fattening and heating effect of the "all corn" scratch feed. Corn products are eliminated entirely from the mash, except that the cracked corn is screened and the meal and fine particles of corn are sifted out and put in the mash; otherwise this would be wasted. Keep grit and oyster shell constantly before the fowls. This is cheaper than any ration which we have seen recommended by any government or state experiment station. In some sections you may buy good commercial feed cheaper than you can mix your own.

There is not the least reason for any poultryman to become discouraged with poultry conditions at present. The wise thing to do is to "keep cool, play safe and hold tight."

# A No-Yard Poultry House

Written for California Cultivator By Jean A. Koethen

**S**HALL laying hens have large yards, small yards or no yards at all? The pros and cons of this question have been argued at length by poultrymen of all sizes, and the only conclusion so far seems to be that more depends on the man who uses the yard than on the yard. Some men are successful with no yard at all; others fail to succeed when their hens are given the most ample range.

So far the no-yard system has had a much larger following in the East than in California. Naturally it would seem rather better adapted to a cold climate than to a warm one. How largely it is used in the northern part of the state I do not know, but one man, at least, has made a conspicuous success with it. This man is Charles Weeks of Palo Alto, one of the largest White Leghorn breeders in the state. His system of housing hens is so unusual and so efficient in its results that the house he uses has come to be known as the Charles Weeks house.

To introduce such a house as this to Southern California, and at such a time as this, requires a little courage, but Frederick T. McLoughlin of Gardena, a poultryman whose years of experience belie his youthful appearance, has had the courage to do it, and two long, neatly finished Charles Weeks houses, already filled with contented pullets, bear witness to his faith in the new system.

The central idea of the Charles Weeks system is the keeping of the hens in small flocks. Twenty hens or twenty-five pullets is considered a sufficient number to be housed together. Mr. Weeks claims that pullets kept in this way are more healthy and more productive than when kept in the large flocks one sees on most poultry ranches.

The two houses Mr. McLoughlin has just completed are each 400 feet long and divided into 50 compartments. With from 20 to 25 pullets in each apartment, from 1,000 to 1,200 birds can be accommodated in each house. Each house faces the east and is five feet high at the rear and seven feet high in front, with a three-foot pro-

jection to keep out sun and rain. The entire front is inch-mesh wire. As the house is only eight feet deep this open front admits the sunshine to every corner and keeps the air practically as fresh as if there were no walls. To make perfect ventilation a certainty at all seasons there is a small window under the droppings-board of each apartment.

The apartment allotted to each flock of hens is 8x8, and is separated by a board partition from the apartments on each side, so that every flock is as completely isolated as if it were by itself. Roosts and droppings-boards are quite high, so that every inch of the floor may be available for scratching. Mash hopper and automatic water fountain inside and a wide trough for greens outside the wire complete the very comfortable furnishings of this little apartment.

The problem of scratching litter, which in these times of high grain prices is a serious one, is very neatly solved. There is no litter at all, but sand, clean beach sand on floor and droppings-boards. This is not a cheap covering, but is permanent and sanitary. Mites will not breed in it as they do in straw, and the droppings are cleaned from it by lightly scraping the top each day. The layer of sand on the floor is eight inches deep and that on the droppings-board four inches deep. This is expected to last a year.

The cost of building this house is about that usually allowed for an ordinary house—perhaps a trifle less. Whether hens can be fed as cheaply in such a house as where double yards make the growing of a forage crop possible is a question that would probably be answered in the negative, but the fact is very few poultrymen make any attempt to grow greens in their yards. If hens must be given their greens cut up, it makes little difference whether they have a dirty yard to run in or none at all, and such a house as the one described, if it is kept clean, is more sanitary than the common run of chicken yards. Certainly the system is worth trying. It seems hardly suited to the hot climate of our inland valleys, but near the coast it should work well.

Citrus Fruit Market

LOS ANGELES, July 18, 1917.

A material shading in price is noted in both oranges and lemons. This is especially true in the auctions. This is in part at least due to the heavy deciduous and small fruit season. Also cantaloupes have been poured into the market as never before. In addition the shortage of box shoo and cars has complicated the fruit shipping season on all sides.

The cool weather has induced withholding of orders for lemons and in addition foreign lemons have been received in large quantities.

Shipments of oranges from Southern California since November 1, 1916, 33,710 cars, lemons 6427, total 40,137; to same date last year oranges 26,217, lemons 5373, total 31,590. From Central California to date this season oranges, 4977, lemons 164, total 5141; to same date last year, oranges 5394, lemons 146, total 5540. From Northern California to date this season, oranges 845 cars; to same date last season, oranges 610, lemons 1.

FROM THE AUCTION

Table with 2 columns: Item and Price. Includes July 17 section.

HIGHLY ESTIMABLE

"Half a loaf is better than no bread, said the philosopher.

"There's no doubt about the respect to which half a loaf is entitled," replied the plain person. "It costs as much as a whole loaf used to."

BIG OFFERING OF PURE BREDS

Live stock men of Central California will have great opportunity to secure Poland-China, Duroc-Jersey and Yorkshire hogs; also some magnificently bred Hereford and Shorthorn bulls and heifers, at the Charles W. Bryson Ranch at Angiola, on the Santa Fe, Tulare County. The ranch is six miles south of Corcoran and 18 miles west of Tulare. This is announced as the largest sale, over 1800 head of pure bred hogs and cattle, ever held in the Valley. The sale will be held Saturday, July 28, and the noon-day feature will be a barbecue and free lunch.

The Bryson Ranch has spared no expense in securing some magnificent stock and has been termed the largest ranch of pure bred hogs west of the Mississippi.

## Sudan Grass a Big Producer of Forage

A. M. Nelson Writes for Cultivator Readers of the Culture and Production of Sudan Grass in Imperial Valley

ONE of the chief qualities of Sudan grass is its resistance to drouth. Sudan hay has not the feeding value of alfalfa, therefore the question arises, "Is there a place for Sudan grass in drouthless alfalfa stronghold?"

Imperial Valley, having 120,000 acres in alfalfa, leading county in the state in this respect, is qualified to answer. That answer would be that there is a place, and an important one. But should the question take this turn; "Will Sudan hay compete with alfalfa?" the chances are that the reply would be in the negative.

Grover Lofftus, president of the Imperial County farm bureau, last year made four cuttings, obtaining an average total of 16 tons of cured hay per acre. Fred Gunterman of Calexico and other valley ranchers report that they have carried Sudan grass through the winter and made good second year yields. But Sudan grass must be classified as an annual, and yields such as obtained in Imperial Valley as exceptional. With yields more closely approximating those of alfalfa, and the necessity of reseeding annually, what is the place of Sudan grass?

Sudan grass makes a place for itself by its adaptability to the wide variety of soils in which it may be profitably grown, because of its quick growth and its heavy yield.

In this age of rotative planting programs, there is room for a "catch" crop that can be put in and taken off in comparative quickstep time, and Sudan grass fills that need. The first cutting may be made around 70 days and one to three additional cuttings made during the summer. It will yield a crop that is palatable to all classes of stock.

Where alfalfa is thin or has been scalded out Sudan grass may be sown

and the feed-producing capacity of the land materially increased.

But probably one of the chief values of Sudan grass is that it may be planted on soils unadapted for various reasons to other forage crops. In every arid country the land contains various degrees of salt. Generally compact soils are also to be found. Sudan grass has been found to flourish in salty ground where it was impossible to get a stand of alfalfa.

"If you have any land that is of a nature that you have not been able to

The yield of 16 tons per acre made in Imperial Valley by Mr. Lofftus was made on hard soil, the cheaper type of soil which is unadapted to alfalfa. In preparing the land he first saturated the ground, disked and then seeded with a pressed drill planter, after which he dragged the field.

One of the pioneer Sudan grass growers in the valley is Sam E. Robinson, whose place is east of Imperial. His first planting was from a package of seed received from C. V. Piper, in charge of forage crop investigations of

used for planting milo and double the rows, in moist soil. By the first plan I got a good stand with about 15 pounds of seed. I thought it was really too thick. By the second plan I have what I think is a satisfactory stand. I have a preference for the latter plan and believe in soaking the ground thoroughly before planting and doing all the cultivating before the seed is in the ground."

Paul I. Dougherty, Imperial County farm adviser, will advocate that all valley planters who do not get their milo in by July 20 plant Sudan grass until August 15.

"The value of Sudan grass in the Southwest has been demonstrated," Mr. Dougherty says. "On the best alfalfa land it will figure only as a 'catch,' or rotation crop, but on lands where alfalfa is grown only with difficulty or where it is scalded out Sudan grass will add materially to the feed production. The yields in the Southwest equal those of alfalfa but the feeding value is not so great. It is eagerly eaten by stock and is a good supplementary feed. It is noticed in the case of dairy animals that the results of feeding Sudan hay are not as good as with alfalfa, although a mixture makes an excellent feed. In analysis, Sudan hay closely resembles barley hay but of course the yields per acre are very much greater."

The seed yield in Imperial Valley is also high. Dee Turner, a pioneer Sudan seed grower in Oklahoma and western Texas, is growing a field of 450 acres near Mt. Signal, Imperial Valley. He expects a seed harvest of 2,000 pounds to the acre. The Imperial Valley Sudan acreage this year is approximately 1,500 acres. The ranchers have been watching it this summer and the indications now point to plantings next spring totalling between 10,000 and 15,000 acres.

Sudan Grass in the Imperial

get any kind of a crop from it, try Sudan grass," advises Mike Liebert, a rancher near Seeley, "I have seen Sudan grass grow 20 inches high, with but little water, on land that formerly would not sprout anything. It was planted on this barren spot as an experiment. Nothing else had ever been grown on this particular spot.

"I also know of a case where Sudan grass was planted at the end of a cotton field, the end being used to drain water from the field and of course making it impossible to bring a cotton plant up. The grass was cut last fall, was pastured in the winter and this year went to seed at a good height. It received no water after the last cotton irrigation which was in October."

the department of agriculture, the man who introduced Sudan grass from Egypt in 1909.

"Sudan grass is so similar to sorghum and the milo group that anyone having experience in planting these will have little difficulty in getting 'a stand,' says Mr. Robinson. "The only difficulty I have experienced in securing a stand has been when I planted it in thin alfalfa in the spring. I think one reason for my failure to get a better stand was that I was a day or two late in giving the second irrigation.

"I have used two methods of planting, one being to sow broadcast and harrow and then irrigate as I would for milo maize, the other being to use a corn planter with plates such as are

## Safeguarding Water Rights

Attorney George E. Farrand Calls Attention to the New Law Affecting Water Rights

ernor May 5. The law is quoted in full:

Section 1. (a) The term "private irrigation plant," when used in this act, shall be construed to mean a water system which is not operated by a mutual water company as herein defined or by a public utility as defined in the public utilities act, approved December 23, 1911, and acts amendatory thereof, or in the act entitled "An act providing for the regulation of water companies, defining the powers and duties of the railroad commission with reference thereto, and defining the conditions under which such water companies become subject to the provisions of the public utilities act and the railroad commission of the State of California," approved April 25, 1913.

(b) The term "mutual water company," when used in this act, means any private corporation or association organized for the purpose of delivering water solely to its stockhold-

ers or members at cost.

Sec. 2. For the sole purpose of increasing the output of agricultural products in this state during the time the United States is a party to war or to a state of war, the owner of any private irrigation plant or any mutual water company may at its option deliver water to others or others than its stockholders or members, with or without compensation, without becoming a public utility subject to the jurisdiction of the railroad commission of the State of California; provided, that no delivery of water to others than stockholders or members shall be authorized until the orders for water of all stockholders or members made in accordance with the constitution, by-laws, rules or regulations of such mutual water company have been filled; and provided further, that the temporary service herein authorized shall not be construed as granting any right to render or receive such service more than six

months after such war need has ceased; and provided, further, that after June first, one thousand nine hundred seventeen, no such temporary service of water shall be made unless a statement is first filed with the railroad commission stating the private irrigation plant or mutual water company rendering such service, the party receiving such service, the lands irrigated and the rate, if any, charged for such service.

Sec. 3. This act is hereby declared to be an urgency measure, and under the provisions of section one of article four of the constitution of the State of California shall take effect immediately. The facts constituting such urgency are as follows: The United States is now in a state of war and there is a shortage of crops in this state and throughout the nation generally. It is therefore necessary for the immediate preservation of public safety that this act take effect immediately so that the use of water in the irrigated area and the resulting crop returns of the state may be increased to the maximum output without delay.

Attorney Farrand warns: "Please note carefully that under Section 2 no temporary service of water shall be made unless a statement is first filed with the Railroad Commission."

SOON after the declaration of war committees were appointed in every county of California to survey agricultural resources and secure as large production of staple foods as possible. To that end it was urged that surplus water not needed in one section or on one farm might be transferred to another and every available drop be turned to use. There was, however, the legal obstacle of possible clouding title to the water right if its use were permitted on other lands.

To overcome that on April 18 the directors of the California Fruit Growers Exchange, in conference with Doctor H. J. Webber, who was chairman of the committee conducting the survey for Southern California, upon suggestion of Attorney Geo. E. Farrand, recommended to the state council of defense that certain emergency legislation be enacted whereby persons owning private water rights and mutual water companies could permit portions of their water supplies to be delivered to and used by others without such conduct affecting their status as private owners and without such action operating as a dedication of their waters to the public use. A bill was passed and approved by the gov-

## The Scales With A 10 Year Guarantee

Be your own weighmaster. A dependable, all-purpose scale on your farm makes and saves you many a dollar which otherwise you would lose without knowing why or where.

### McDONALD— The Original Pitless Scale

Sold under a positive 10-year guarantee of accuracy. Solid steel frame locked at corners, solid steel joists, knife edge bearings protected against frost and clogging, and other distinctive features in design and construction make the McDonald trouble-proof, repair-proof and permanently reliable. Many of them in use over 20 years are giving satisfactory service today.

Easy to erect or move. No pit to dig or expensive foundation to build—no expert needed. Full directions with every scale which anyone can follow.

Ask your Moline Dealer about the McDonald Pitless, or write us for Illustrated Literature.

## Predrying of Grapes

By W. Flanders Setchel Before Grape Growers' Conference at Fresno

THE subject with which I have to deal is one to which little, if any, consideration had been given by grape growers prior to the latter part of the season of last year, when early rains resulted in the loss of many thousands of dollars worth of grapes, a large proportion of which rotted upon the vines, whilst others were shipped in a weak condition, due to abnormal water content and exterior moisture. Many cars of these latter grapes were leaking grape juice before arrival at destination. Emperor grapes valued in excess of \$100 a ton, failed to realize freight and refrigeration upon arrival at destination.

Coming to my actual experience in the predrying of grapes, it should be understood that this was limited to last season and confined to experimental proportions. The experiments were, however, conducted under conditions such as to positively establish the practicability of predrying grapes for Eastern shipment upon a commercial scale.

A raisin dryer in first-class condition, and practically air-tight save for the vents, was used for the purposes of the experiment. Heating was obtained by a boiler plate oil furnace, air circulation was secured by a three-foot fan placed over furnace, the return-air system being used. The grapes experimented with were picked wet with rain and atmospheric moisture, being in a condition entirely unsuitable for Eastern shipment. They were carefully laid upon raisin trays, the bunches not being allowed to touch each other. Car strips with small wooden blocks attached gave the needed clearance between trays in the stacks. The grapes were placed at the rear end of the dryer, the fore part being filled with wet raisins in various stages of drying. The grapes were subjected to a circulating air heat of 100 degrees for between three and four hours, and when removed the skins and stems of the grapes were entirely free of external moisture, whilst the flesh on the berries was firm. The grapes were then placed in standard picking boxes and stood in the packing house about 30 hours before being packed and put into iced cars. This fruit was distributed over four cars, the bulk of which consisted of nonpredried fruit. The predried grapes were packed under a separate mark, but bore no indication to buyers by which they could be identified as different from the balance of the grapes, nevertheless the predried fruit without exception realized higher prices than the nonpredried, the average increase being 15 cents per crate. The cost of predrying figured out at slightly less than \$10.00 per ton. In the case of a dryer specially equipped to handle table grapes the cost would be materially reduced. A successful predrying plant for grapes must embody in its operation, first, a minimum of handling of the grapes and minimum of cost in operation. To this end the dryer should be an integral part of the green fruit packing house. The grapes should be picked in boxes having open sides so that no further handling of the grapes will be necessary from picking to packing, provided the boxes are dry to commence with.

In estimating the economic value of this experiment, insurance against loss through a recurrence of the

early rains of last year represents but a fraction of its real significance. With a predrying plant as part of the equipment of the green fruit packing house late grapes can be harvested during the entire working day, notwithstanding the morning dews which commonly necessitate postponement of picking until 10 a. m. and frequently later. Further, grapes can be gathered and shipped after rains when those without predrying facilities must wait for their grapes to dry on the vines, thus affording bare markets for those more fortunately situated through possession of a predrying plant. Even under circumstances where the condition of grapes makes it possible to ship them with but a slight risk of decay, predrying will pay liberal dividends upon its cost, owing to the greatly improved carrying qualities of the grapes if predried. Toward the latter part of each year fear of rain causes grape growers to hasten the completion of their season's shipments, regardless of market conditions, through concern as to the possibility of a rain, whilst where a predrying plant is available the period of marketing can be safely and materially extended, thereby improving market prospects, both for the nonpredried and for the predried grapes, the former being freed of the competition they would otherwise experience from the predried grapes were they marketed at the same time.

In the case of Emperor grapes it is now an established principle that packing in drums or kegs must be completed prior to the coming of the early morning dews. With a predrying plant there is no such limitation, and should at any time the sugar content of Emperor grapes under the standardization law be raised, a predrying plant would become a requisite of every packing shed handling this variety of grapes. The Eastern trade, owing to their severe losses last year upon drum Emperors purchased f.o.b. California, will approach these grapes more warily in the future, but one can predry his drum Emperors for less than \$10.00 per ton and either guarantee their condition to the purchaser or ship East and carry in cold storage at one's own risk, with the assurance of extremely gratifying results.

Railroad rates are about to be increased substantially. Every cent of increase in freight and refrigeration rates is a direct loss to the grower because the Eastern trade figure their cost of our products on a delivered basis, whether they buy f.o.b. California or through their auctions. Inversely, therefore, every decrease in freight and refrigeration charges puts money directly into the pockets of the growers.

The orange growers now effect a material saving on a portion of their shipments by precooling and using dry cars which are iced at a designated icing station en route to destination, the shipper assuming responsibility for deterioration of the fruit. It is my opinion that future experiments in the predrying of grapes should be conducted along such lines as would demonstrate the practicability or otherwise of packing and shipping predried grapes in ventilated dry cars without cooling, to be iced at a designated icing station under similar conditions to those obtained by the orange growers. The commercial value of predrying under any of the beforementioned conditions would then be fully established and a very material saving in refrigeration charges would be insured, resulting in direct annual saving to grape growers and, equally important and remunerative to growers, a higher standard would be established as regards condition of fruit at delivery in our Eastern markets.

## Marking Contents of Fruit and Vegetable Containers

THE office of information of the United States Department of Agriculture has issued a ruling as to the Net Weight Amendment to the Federal Food and Drug Act. The net Weight Amendment provides that all packages of food entering interstate or foreign commerce must be plainly and conspicuously marked with the quantity of the contents in terms of weight, measure, or numerical count. From this ruling we quote:

The articles listed below may be marked by either weight or dry measure, or, when packed in barrels, in terms of the United States standard barrel and its lawful subdivisions, the third, half or three-quarters:

Apples in barrels, boxes, cartons and hampers. Cases or cartons containing graded apples may, if desired, be marked in addition with the number of apples per package.

Apricots, prunes and plums in baskets, boxes and cases. (When packed in small open containers inclosed in crates, see paragraph relating to small open containers).

Beans (in pod) in baskets, boxes and hampers.

Berries and currants in baskets. (When packed in small open contain-

ers inclosed in crates, see paragraph relating to small open containers).

Cherries in boxes and baskets. (When packed in small open containers inclosed in crates, see paragraph relating to small open containers).

Cucumbers in barrels, baskets, hampers, boxes and crates. Containers of graded cucumbers may, if desired, be marked in lieu of weight or dry measure, with the number and length of the cucumbers.

Grapefruit in sectional cases. If desired, cases may be marked by dry measure and count; or by count and average diameter in lieu of weight or dry measure.

Grapes in baskets. (When packed in small open containers inclosed in crates, see paragraph relating to small open containers).

Lemons in sectional cases. If desired cases may be marked by dry measure and count; or by count and average diameter in lieu of weight or dry measure.

Okra in baskets, boxes and hampers.

Onions in crates, baskets and hampers and in sacks of uniform quantity of contents. Cases containing graded onions may, if desired, be marked in addition with the number of onions per case.

Oranges in sectional cases. If desired, cases may be marked by dry measure and count; or by count and average diameter in lieu of weight or dry measure.

Oranges, satsumas and tangerines, in half boxes. If desired, cases may be marked by dry measure and count; or by count and average diameter in lieu of weight or dry measure.

Peaches in boxes, cases, baskets and hampers. Boxes and cases of graded peaches may, if desired, be marked in addition with the number of peaches per package. (When packed in small open containers inclosed in crates, see paragraph relating to small open containers).

Pears in barrels, boxes, baskets and hampers.

Peas (in pod) in baskets, boxes and hampers.

Peppers in barrels, baskets, boxes and hampers. (When packed in small open containers inclosed in crates, see paragraph relating to small open containers).

Potatoes in barrels, crates and hampers, and in sacks of uniform quantity of contents.

Quinces in barrels, boxes, baskets and hampers.

Squash, (Southern) in crates, boxes, baskets and hampers.

Tomatoes in boxes, "lugs" and baskets. (When packed in small open containers inclosed in crates or "flats," see next paragraph).

### Small Open Containers

Pending a determination of the question as to whether the quantity of the contents must be marked on small open containers, inclosed within crates or "flats", in which small open containers are packed apricots, berries, currants, cherries, grapes, peaches, plums, prunes, peppers and tomatoes, and unless public notice of not less than two months be given, the department will not recommend proceedings under the Food and Drug Act solely upon the ground that such fruits and vegetables in such small containers bear no statement of the quantity of contents. The crates inclosing such containers should, however, be marked with the number of small containers and the quantity of the contents of each.

Also for the present and until further public notice to the contrary of not less than two months, the department will not recommend proceedings under the Food and Drugs Act solely upon the ground that the quantity of the contents is not marked upon the containers of the following articles, packed as described below. No objection will be interposed by the department to any trade marking which is not false or misleading.

Asparagus in boxes and cases.

Beets with tops, bunched, in drums and hampers.

Cabbages in crates.

Cantaloupes and casabas in crates and baskets.

Regulation No. 29 relating to marketing the quantity of food in pack-

be reduced to their lowest terms; decimal fractions shall be preceded by zero and shall be carried out to not more than two places.

(e) Statements of weight shall be in terms of avoirdupois pounds and ounces; statements of liquid measure shall be in terms of the United States gallon of 231 cubic inches and its customary subdivisions, i.e., in gallons, quarts, pints, or fluid ounces, and shall express the volume of the liquid at 68 degrees Fahrenheit (20 degrees centigrade); and statements of dry measure shall be in terms of the United States standard bushel of 2,150.42 cubic inches and its customary subdivisions, i.e., in bushels, pecks, quarts, or pints, or, in the case of articles in barrels, in terms of the United States standard barrel and its lawful subdivisions, i.e., third, half, or

Sugar Beets in San Fernando

Since irrigation has been made possible in San Fernando Valley the increase in the planting of sugar beets has been wonderful. It is now one of the great industries of that valley.

age form should be consulted. Special attention is directed to paragraphs (d) and (e) of that circular which are as follows:

(d) If the quantity of the contents be stated by weight or measure, it shall be marked in terms of the largest unit contained in the package, except that, in the case of an article with respect to which there exists a definite trade custom for marking the quantity of the article in terms of fractional parts of larger units, it may be so marked in accordance with the custom. Common fractions shall

three-quarters barrel, as fixed by the act of March 4, 1915 (38 United States Statutes at Large, page 1186): Provided, That statements of quantity may be in terms of metric weight or measure. Statements of metric weight should be in terms of kilograms or grams. Statements of metric measure should be in terms of liters or centiliters. Other terms of metric weight or measure may be used if it appears that a definite trade custom exists for marketing articles with such other terms and the articles are marked in accordance with the custom.

## Necessity of Vine Disease Control and Better Field Observation

By Chas. F. Collins, Horticultural Commissioner, Tulare County, before recent Conference of Grape Growers at Fresno.

WHEN the writer made his advent into Tulare County 31 years ago it was a vast grain field with a bountiful crop ready for the harvester.

Much of this crop was "volunteer" and produced simply by harrowing or disking into the soil the shattered grain of the previous year's harvest and trusting Providence for results. Under conditions then existing the almost virgin soil would yield a profit provided sufficient rain fell at opportune times.

Unfortunately a continual sapping of the energies of Mother Earth for a third of a century produces very similar effects upon her as upon us who till her surface, namely, we are depleted, and numerous weaknesses and ailments develop which require the attention of a specialist to correct or alleviate. It is our opinion that the time was ripe several years ago for the services of such a specialist in Tulare County.

For the past 15 years or more a trouble known locally as "black mildew" or "Spanish measles" has been

found to a greater or less extent in the vineyards of our county. It is characterized by a blighting or drying up of the fruit at any stage before it reaches maturity, this depending upon the time of its attack, or in mild cases by a spotting which greatly injures the appearance and commercial value. There is usually little apparent injury to the vine. This trouble has gradually increased in virulence and area with time and the increased acreage until it has in the past few years become a serious problem in many of what were once our best vineyards.

Both the federal bureau of soils and of plant industry have declared after careful examination of samples from the worst affected of these vineyards that no disease is present, hence we must conclude that this trouble is due to some abnormal condition of the soil.

About five years ago another vine trouble of a different nature made its appearance, which destroys not only the fruit, but in many cases the vine itself succumbs. This, like the so-called "Spanish measles," has mani-

festated itself in various sections of our vine growing district and become a menace to many vineyards.

At the request of the writer and others, members of the university staff and federal department of agriculture have on various occasions visited these affected districts and without exception pronounced the trouble serious, but no attempt was made at anything more than a superficial examination. As the owners of the affected vineyards, as well as many others were not only willing but anxious to cooperate in every possible way with anyone capable of rendering assistance much dissatisfaction was expressed at the inability to even secure an attempt at investigation.

In September of last year J. W. Jeffrey of the state viticultural commission was in our county on a tour of inspection of the grape packing houses, and the writer called his attention to the conditions existing as stated. He expressed great surprise that no action had been taken in a matter which was obviously of such vital import to at least the various owners of the already affected vineyards and indirectly to the grape industry of the county, and promised to take up the matter of an investigation with the state viticultural commission.

This promise was promptly fulfilled, and after a preliminary investigation by officials of the commission Mr. Jeffrey was detailed to locate in our county and study the problem during a term of months. Mr. Jeffrey contended from the first that the trouble was soil conditions and not a specific disease, as was at first feared, and arranged with the federal department at Washington for analysis of soils and samples taken from the various infected districts.

With the aid of the knowledge thus gained he has conducted experiments in the application of fertilizers, lime and gypsum, as well as drainage and irrigation where necessity seemed to require, and the result is that in less than six months from the time of starting this work we have good evidence that he is on the high road to a successful solution of some of our problems, the result of which may mean the saving of many thousands of dollars to the grape growers of this and adjoining counties.

Nor are these all of our troubles. A fine young apple orchard in a district far removed from our vineyards and a peach orchard still more remote from either of these are slowly succumbing to some unseen, adverse influences. These orchards have been given a superficial examination by soil experts and entomologists and the trouble pronounced serious, which is plainly apparent to the most casual observer, as evidenced by the many vacancies already existing and areas filled with dead and dying trees, but no solution has been suggested.

These are cases which like our grape trouble require study and investigation for an extended period of time by someone trained in this line of work.

I could relate many instances of this kind occurring in Tulare County, and the same conditions prevail in any of the more important horticultural counties of the state.

It is my opinion that the cause of 50 per cent of our horticultural troubles is beneath the surface of the earth. This statement is made deliberately and advisably after years of experience and observation. It may be too much or too little water or water applied at the wrong time or in the wrong way. It may be an excess

or deficiency of certain elements of the soil causing malnutrition, or in other words, an unbalanced ration for the plant.

Whatever the cause may be the effect is much the same. The plant becomes unproductive and, unless remedial measures are adopted, eventually loses its vitality and dies.

Although the law governing the office of county horticultural commissioner defines his duties as purely executive, I know I am safe in saying that there is not a commissioner in this state who will not gladly assist to the utmost of his ability in this or any other work that will in any way aid the fruit growers; but there are some very good and sufficient reasons why he can not do all that is required for success in this line.

This is the age of the specialist and this work requires special training to fit the investigator for it. Furthermore, no commissioner of any of our more important fruit-growing counties, if he possessed all the available knowledge in the world on this subject, could possibly find the time to devote to investigations of this kind in addition to his regular duties.

Many cases are referred to us which are easy. The work of a few moments will reveal malignant root knot or crown gall strangling the life of the tree, or oak fungus sapping its vitality. Perhaps a gopher with no regard for the high cost of living, has been subsisting for days on the succulent bark of its roots.

Often a little questioning and a very superficial examination of the soil will plainly indicate that extremes in

moisture conditions or excess of alkali is the cause of all the trouble. While it is true that cases of this kind are of almost daily occurrence, it is also true that there are many of such an obscure, enigmatical and doubtful nature as to challenge the skill of the trained soil technologist and require his most careful observation and study for weeks, months or even years before definite conclusions can be reached.

The little leaf of the peach and other deciduous fruits has been studied for four years by the best authorities the federal agricultural department can furnish with almost no results to date.

We have long believed and are continually becoming more confirmed in our opinion that a specialist in this line of work would be a valuable asset and worth many times whatever salary his position may command to any of our fruit-growing counties.

We are living in strenuous times and facing an apparently inevitable world shortage of food supplies in the near future. The farmer is being coaxed and urged to produce every possible pound and meet, in so far as he can, this deficiency, and all available assistance should be at his command.

I think you will all agree that in many cases increased efficiency offers a safer and saner solution of this problem than increased acreage.

There are many hundreds of acres of trees and vines in Tulare County from which the owners are not securing the profits they might if soil conditions were improved, and they should be taught how this may be done.

## When to Prune Avocados

**R**EGARDING pruning of the avocado tree we note in the proceedings of a former meeting of the California Avocado Association C. P. Taft said that the Taft had been heavily pruned, but in order to obtain bud wood rather than for shaping the tree. He was in doubt as to whether this had delayed the fruiting or lessened the amount of production. Along this line he said a medium sized tree that had borne fruit was badly damaged by a wind storm—one side blown off—and that for the next three and a half years it devoted all its energies to rebuilding wood. Last year it regained its normal size and now has one thousand fruits on it. He will prune only when he thinks it necessary, perhaps only in shaping the tree. Disastrous experiences from pruning in August have convinced him that the trees should not be cut back in the very hot weather. He prefers the early spring or November. This applies to nursery stock as well as older trees. He considers spring or fall as the most desirable for pruning. After a bud has taken hold and is ready to grow, Mr. Taft does not cut the top of the seedling back until cool weather, leaving it to protect the young tree from the sun.

J. T. Whedon advised protection for

the trunks by encouraging downward growth of foliage as with oranges. He believes in waxing the cuts regardless of how smooth they are. D. W. Coolidge agrees as to this method, and advises systematic pruning for the first few years, but differed with Mr. Taft as to the season for such work, advising cutting back in the vigorous growing season, when the high flow of sap will heal the cut more thoroughly.

E. S. Thacher's experience tends to favor pruning. His trees are seven years old and all bushy, some of them threw out high limbs in the center and these were cut back, giving his trees a uniform appearance. His theory is that it does not hurt to cut them any more than any other tree, and later he believes the production will be increased by pruning. He advises waxing the cuts.

Referring to the Harman variety and its inclination to grow in large umbrella form, Mr. Coolidge stated that it could be shaped up to form a perfect pyramid, which resists heavy winds and protects its body from the hot sun. In his estimation a great deal of fruiting space is gained by such treatment. He said he could show limbs two inches in diameter that had been pruned without any die-back. All Mr. Coolidge's pruning is done in the vigorous growing season. He says that he has known them to die back in many instances, when cut in the early spring or the fall. He had never trimmed back a Taft or any of the other thick-skinned type.

## Tractor Demonstration at Los Angeles

Written for California Cultivator

**O**WING to the success of last year's demonstration, which was held at Puente, the Traction Engine and Implement Dealers Association of Southern California have laid plans for what they are terming "The Second Annual Demonstration."

The location is changed this year, they having secured the Vail property on Telegraph Road, two miles east of the end of the Stephenson Avenue car line from Los Angeles. Telegraph

Road is to the right of and parallels the Whittier boulevard. There are 650 acres in the tract so the farmer who attends the demonstration will have ample opportunity of being shown just how much the various tractors and implements can do. The association has secured several new members this past year, so that the number of tractors and appliances in actual working demonstration will be infinitely larger. In addition they are planning on a comprehensive exhibit of all accessories pertaining to trac-

tion engines, farm implements, automobiles, trucks, in fact almost everything that may have the slightest interest to the rancher, orchardist or grower who may attend. The wife, daughter and sister have not been overlooked either, and there will be exhibits of all the latest household equipment necessary to modern life, from the latest washing machines and churns up to the wicker living furniture and player pianos. There will be public demonstrations of the tractors and implements in action, plowing, harrowing, etc., every afternoon from two to four. For those who are interested, the demonstrations at any time during the five days meeting, and the most exhaustive and minutest criticism is invited, for only the machines and appliances that can stand such a test are entered.

It is especially asked that the visitor bring with him any and all questions concerning tractor farming that may have puzzled him, either as regards the mechanism of the tractor or the best way of using them on the individual's piece of ground. There are men thoroughly skilled in mechanics and conversant with the many problems that the agriculturist, orchardist, and grower has to contend with and it is the business and pleasure of these men to put the rancher on the right track.

The gathering together of such thousands of men, whose sole business is to get Old Mother Earth to yield the greatest harvest possible, whether it be beans, beets, potatoes, wheat, citrus fruit, or grapes, is bound to result in a splendid intermingling and exchanging of ideas that are the result of the best of all teachers, "experience." Combine this with the fact that one is to be shown a gathering of that which represents the highest form of modern farm appliances, and the educa-

tional value can not be, over estimated.

The falsity of the idea that a man of moderate means with a small acreage can not afford a tractor has frequently been proven. In fact such a man can't afford not to have one, and this demonstration is going to prove to him as well as to the owner of thousands of acres that the day of the tractor is here.

Not only has Old Dobbin been superseded by the tireless tractor, but the plow and the harrow and the cultivator, and all their kindred of 20, yes, ten, years ago have been so greatly improved and outclassed that comparison is impossible. And the visitor at the Second Annual Demonstration of the Traction Engine and Implement Dealers of Southern California will be shown the most highly perfected model of each. All the railroads will have summer rates of a fare and one-third, for the round trip. There will also be a first class restaurant where the visitors can get the best of food and service at moderate prices.

The officers and members are: O. H. Stevens, President; H. L. Marsh, Vice President; W. L. Cleveland, Secretary; Alex. McCluskey, Treasurer; R. M. O'Neill, Manager. Members: C. S. Anthony, Arnott & Co., Advance-Rumley Thresher Co., C. L. Best, Gas Traction Co., Bean Spray Pump Co., E. P. Bosbyshell Co., California Moline Plow Co., California Implement Co., Carter & Jacobs, J. I. and T. M. Case Co., W. E. Crossman, W. L. Cleveland Co., Dauch Manufacturing Co., Dixon & Griswold, L. M. Davenport Co., Wm. Gregory & Sons, A. F. George Co., Holt Manufacturing Co., International Harvester Co., John Deere Plow Co., Johnson & Howe, Killefer Manufacturing Co., L. A. Auto Tractor Co., Samson Sales Co., Union Tool Co.

## American Institutions—Baseball and B. V. D.

**J**UST as Baseball is the great American Game, so B. V. D. is the great American Underwear. It is made to fit the American climate, the American figure and the American idea of personal efficiency through cool comfort.

In our own modernly equipped Cotton Mills at Lexington, N. C., nainsook from which Loose-Fitting B. V. D. Undergarments are made, is produced in a scientific manner from selected cotton to insure durability in wash and wear.

In our own B. V. D. Factories the garments are skillfully cut, strongly stitched, accurately finished—to fit and to be cool and comfortable all day long.

## Owens Bean Threshers

small and large, 5 sizes

**1 to 3 H. P.  
Separators  
for small  
crops  
at small  
expense**

Here is a successful Bean Thresher for the farmer who has only a small bean crop. While small it does the very best work. Will thresh any kind of beans, without splitting the seed. Besides paying for itself, this thresher will be a splendid source of profit. Made by the largest manufacturer of Bean cleaning machinery in the World. We also sell five other sizes including the large 36x54 Owens Standard Thresher. All these threshers are thoroughly tested and proved for California crops. This is the best year to buy and operate a bean thresher. Descriptive catalogue sent on request.

# Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Weevil in Beans

Please give method of keeping weevil out of beans after they are harvested.—Subscriber, Yorba Linda.

The only way is to treat the beans when harvested with carbon bisulphide, one pint to 1000 cubic feet, treating in an air-tight bin 24 hours or more, as has often been described in these columns. Remember that carbon bisulphide gas is explosive and no light or fire must be brought near. Afterward keep the beans in containers which are weevil proof.

### Uncle Ben Plum

I have heard of a plum named Uncle Ben, grown principally in Vaca Valley, and commonly called the "Thanksgiving plum" because it ripens about that date. Can you tell me anything about it, and if it would be adapted to this locality where can I get trees?—Subscriber, Long Beach.

This question was referred to M. Sharpe of Vacaville who writes:

"The Uncle Ben plum is a fair sized plum, packing probably 5x5. It is of the Domestica group, yellow skin, yellow flesh, freestone, and very prolific. There is no reason why this plum should not be a profitable market variety, owing to its season and to the fact that it is unlike most very late plums, it being juicy and extremely delicious. This plum is ready to ship during the first part of November. It should not be called the Thanksgiving plum as there is already a plum by that name in the East. You may pick ripe plums of the Uncle Ben for your Thanksgiving table, however, and I have frequently pruned the tree when it was without foliage and loaded with fine plums. It seems to work well on all stocks but sizes better on peach. A small orchard of this variety should pay well.

"There is one other late plum called the Primate. This plum is not as late as Uncle Ben but late enough to be shipped in straight cars of grapes when there is no other plum. This is a large blue plum of the Domestica group and introduced from England. There should be a good local market for these plums also."

### Limberneck

I am writing to see if you can tell what is the matter with my hens. Their heads drop clear to the ground, neck is entirely lifeless. Seems to be a thick slime in the mouth. Don't eat. Once in a while they jump and flutter, then lie flat and lifeless. They live a day or two, then die. Some have diarrhea. Is it limberneck or a poison? Feed has been barley, milo, a little milk, clabbered, fresh greens, wild radishes. Have given turpentine and permanganate of potash crystals in the water. They were parked but now I let them run.—Subscriber, Redondo.

"The condition known as limberneck," says Dr. Salmon, "is in reality not a disease, but is a symptom of several diseases which are characterized by a paralysis of the muscles of the neck which makes it impossible for the bird to raise its head from the ground. This condition is due to the absorption of poisons from the intestines, which act upon the nervous system and cause paralysis. It is generally associated with indigestion, or the eating of moldy grain or putrid meat or with intestinal worms." Does this describe the condition of your

hens? If so, what is the cause? If they have been yarded they are not likely to have had access to putrid meat. Their ration of barley and milo could hardly have been moldy at this season. Intestinal worms they may have. You can find out only by inspection of the droppings whether this is the cause. But what about that unbalanced ration, hard grain only, no mash, no meat, no animal food save a little clabbered milk. The loading of the digestive organs with hard grain, and especially a grain with so much hull as barley in its natural state, might easily, it seems to me, produce such a condition as that described. The first step in a cure is to get rid of what is clogging the intestines. Castor oil is best for this purpose. Mix a third of a teaspoon for each pullet or half a teaspoon for each old hen in a little moist mash, and feed early in the evening. Feed no grain that day, but give plenty of water and green feed. The following day resume the regular ration, but you will do well to make a change in your method of feeding. Instead of making barley and milo the whole of your grain ration, make half of it dry mash. Bran and corn meal, which have been the standbys for this purpose, are too expensive at present, but you can make a fair mash out of the oat chop which is now sold at \$2 per hundred, alfalfa meal and beef or fish scrap. Three parts by weight of the oat chop and one each of the alfalfa meal and meat scrap makes a fairly well balanced mash. Keep this before them during the day, give plenty of grain at noon and also in the morning if you have it, and make the evening meal a light feed of milo or sprouted barley, and I think your hens will improve in health and egg production.

### Potatoes for Stock Feed

Can you tell me the German process of making potatoes into stock and chicken feed by cooking and then drying?—Subscriber, Santa Rosa.

Eugene Grubb in "The Potato" says that potatoes and potato products for stock feed are much more used in Europe than in America. What is used as stock feed is usually the waste from processes of manufacturing desiccated potatoes, starch meal, etc. for human consumption. The pulp, somewhat similar to the beet pulp produced in beet sugar factories, is then fed to stock. Where prepared directly for stock two methods are used. In one the sliced potatoes are exposed to hot gases from furnace; in the second the potatoes are finely crushed and dried by heat from steam coils at a lower temperature. A method for cooking and drying sweet potatoes is given in the Cultivator of July 21 by Prof. Wm. V. Cruess. Potatoes are boiled until nearly done, then sliced or chopped and dried in the sun. In the same article he gives directions for drying Irish potatoes without cooking.

## Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal. Unsigned communications receive no attention.

### Skin Trouble

My horse has numerous pimples in the skin but no pus gathers. He scratches himself a great deal. His shoulders become sore very easily. He is fat; nine years old; well otherwise and has work only part of the time. Feed oat hay chiefly. What will help him?—Subscriber, Artesia.

It is probably due to too thick

blood. Reduce the feed and give plenty of water to drink. Mix three pounds of epsom salts and one pound of common salt. Give him a handful once a day. If he will not eat it in the feed put it in a long neck bottle, add a cup of water and give as a drench. When this is used get a pint of Fowler's solution of arsenic and give him half an ounce on the tongue or in the feed once a day while it lasts. This should clear up the skin all right.

### Melanosis

I have a cow that has two growths on the udder in front of the teats. They looked like small teats at first but grew larger and broke, allowing a black substance to ooze out the sides. Lately numerous small bunches have formed on the udder the size of peas. The large ones are a little sore. She seems well otherwise and is a good milker. Would like advice as to treatment.—Subscriber, Murietta.

The tumors are probably caused by the gathering of a black pigment that is found in the blood and goes to color the hoofs, horns and hair. It is more common in horses, quite uncommon in cattle, but does occasionally occur. There is no remedy for it except to cut the tumors out, and then they are likely to form on some other place. Once there is an over secretion of the coloring matter in the blood and it starts gathering in places it is hard to stop. It will do no harm only a little inconvenience and soreness in the parts. You might try giving her iodide of potash. Dissolve two ounces in a pint of water and give a tablespoon of the mixture on a little feed once a day.

## Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

### Improvements on Property Bought on Contract

Is there a law in this state requiring real estate firms to pay a person for all improvements which he has put on a place if he is unable to pay for the place and has to give it up after he has put improvements on it up to one-fourth of the purchase price?—Subscriber, Orosi.

While there are some few cases where payment for improvements can be enforced they are rare. The rule is that such improvements are made at the risk of the installment purchaser.

## Brenneis<sup>1</sup> ROW BEET PLOW

Our one row riding beet plow is built especially for horse power and to use in fairly loose soil. It loosens and starts the beets with very little disturbance to the ground and haulers can easily take out large loads. Every part constructed of strongest material and assembled by skilled mechanics. Many years experience in this field have enabled us to perfect a line of beet plows that is unsurpassed in efficiency. We make special designs to order.

# Educational Gardening

Written for California Cultivator By E. Branton

**T**HOUGH history records that care and cultivation of ornamental plants has had a refining influence upon all races of people in all times, it is probably more marked today in our own race than at any time or place in the world's records. Observant writers, too, have noticed that the greatest number of true plant lovers are to be found among the educated and refined. By education is not necessarily meant graduation from either schools or colleges; nor by refinement those drilled in the laws of etiquette merely, but people who are both educated and refined by their very nature and who intuitively love nature in all her departments, being themselves, unconsciously perhaps, the most perfect specimens, mentally, of the highest type of animated nature.

A manifest desire of the American people to beautify their surroundings has become more general within the last decade than at any like period in history. We have awakened from the old stereotyped methods to realize the possibility of design in the adjustment of the house, roads, paths and other adjuncts necessary to the convenience and comforts of the home. We have found that we may have utility without sacrificing beauty; every feature is considered as to its particular fitness, and each arranged with regard to making a harmonious whole. Those of moderate means can never hope to rival the wealthy in interior decorations, such as sculpture, paintings and other works of art, but do not lose sight of the fact that trees and plants will grow as well for you as for a Vanderbilt or a Huntington. Your yard, though less in extent, may with a slight annual expenditure, and with 15 minutes each day devoted to its care, be made to look as beautiful as a like area in the estate of a millionaire.

As a rule remarkably good judgment is shown by most home owners of moderate means in the selection of plants and the placing thereof, but the wealthy man, he who purchases and improves large grounds, does not, as a rule, escape the gardener's art. He needs advice, for the costly features of his residence have led him to desire corresponding effects on his grounds, and too often he seeks to economize by procuring the services of an ordinary lawn builder—a fatal mistake. Luckily the great mass of our people escape such a fate and build on personal taste, and the number of good small gardens and of people brought under the uplifting influence of plant life is steadily on the increase. It cannot be too forcibly urged upon the attention of those intrusted with educational institutions that one of the most certain means of encouraging a desire for studies in natural history, and forming correct principles of taste in young minds is the school garden and landscape embellishment of school and college grounds, using for the latter largely native plants.

## A Few Street Trees

Next to the pepper tree in popularity, and preferable to it for some places and purposes, stands acacia dealbata, the silver wattle, a truly glorious tree when in bloom. Our second choice is acacia melanoxylon, the blackwood. This tree needs a rich, deep soil and will not withstand drouth. Many other acacias make

fine street trees but all may be seen in the nurseries and their chief points ascertained by comparison with the description of the blackwood. Jacaranda ovalifolia, if kept pruned, is very suitable for street purposes, and when in bloom would present a more beautiful sight than any mentioned, though somewhat tender. So too, will the oleander amply repay proper care, if trained as a tree, yet unpopular because always infested with black scale. For dry sections few will prove more popular than Ceratonia Siliqua, St. John Bread or carob tree. This tree is not yet thoroughly appreciated; it makes a marvelous growth under most discouraging circumstances and remains a very pleasing color. In extremely dry locations none will surpass the sugar gum, eucalyptus corynocalyx, and eucalyptus polyanthema, slower of growth but much hardier. In planting any of these trees you cannot make the holes too wide or too deep. If you have but one dollar to spare for each tree put three-fourths of it into digging the hole.

## The Redwood Tree

The redwood is not at all particular as to quality of soil so long as it is moist; it requires plenty of water. What has been said of the soil is equally true of the atmosphere. The moisture of the air seems to regulate its natural distribution, and the limits of the sea fogs are about the limits of the redwood. For these reasons the tree is not adapted to arid regions or far from the seacoast.

## Standardization of Names

At last we are to have a uniform understanding of botanical and popular names of plants. A national committee, while generally adopting Bailey's Cyclopaedia as a standard, has given us the first part of its findings. Old, well-known trade names for plants, names known from the Pacific back to the Atlantic, will not be changed, no matter what they may properly be in botanical science. This means that every nursery catalog may agree with the accepted list and no more confusion exist. Popular names, so far as they exist, will also be brought to a standard and all duplicates dropped. The new lists will no doubt be adopted by the California Association at its next convention at San Jose in October.

## MAKING FERTILIZER FOR FLOWERS

Those who desire their flowers to give the most satisfactory results should know how to make the most essential fertilizers for them in their own home.

Take an old earthen jar and break up a lot of bones in small pieces and place in the jar. Then make a strong solution of lye and pour this over the bones. After it has stood several days, stir with a stick or old iron spoon, and the mixture will become a sort of mush.

This when applied properly to the soil about the roots of flowers will supply every important need. Nitrogen, lime, phosphoric acid and potash are in this mixture. A teaspoon to a gallon of water is sufficient if applied twice a week. Plants that are in a sickly condition due to poor or unfit soil may be given a little more, or the application may be made a little more frequent.

A little soot taken from the kitchen stove will assist in providing nourishment to starved plants. It can be added to the above mixture.—J. T. T.

# "There's Money in SUDAN HAY if planted right now!"

Are you going to profit by the high prices of hay this season? Are you planting Sudan Hay, the fastest-growing forage crop known? Are you going to overlook this money-making opportunity?

Plant the seed now and you can put your profits in the bank in 60 days! Hay prices are soaring sky-high on account of the light crops. Will you have hay to sell in the fall? Don't wait another day—plant Sudan now. Our big illustrated folder tells how to plant, and also everything you want to know about Sudan.

## Special July Prices:

Single pounds (enough for 50x50 feet)—36 cents.  
10 lb. lots—(Will plant half an acre, sown broadcast)—34 cents per lb.  
25 lb. lots—32 cents per lb.  
100 lb. lots—28 cents per lb.

## "ORDER BLANK"

## Davenport's Line of Disc Harrows

Field operations—the actual performance and wearing ability of our disc harrows make them the most dependable for western conditions. The above illustrates our popular 8 foot double disc harrow built especially for tractor power. We are the largest manufacturers of disc harrows west of the Missouri River. This disc is of special sturdy construction, axles 1 1/2 square hard steel, large heavy spools, heavy solid top plates and angle frame with cross angles, equipped with center cutout discs with bearing springs. The 10 and 12 foot discs have double equalizer draft connections. We make reversible discs with extension frame for horse power, also 6 and 12 foot field harrows. The 6 to 12 foot are the same pattern as illustrated.

Remember it is to your interest to buy tools from established home manufacturers on account of being near the factory and because we know the peculiar conditions of local soils. Catalogue and illustrations sent on request.

**OUR ADVERTISERS RELIABLE**

We guarantee our subscribers against  
 loss through dishonesty of any adver-  
 tiser in the Cultivator. We do not at-  
 tempt, however, to adjust trifling differ-  
 ences between subscribers and honest,  
 responsible advertisers, nor will we pay  
 the debts of honest bankrupts. Notice  
 of complaint must be sent us within 30  
 days from date of the transaction, and  
 the subscriber must have mentioned the  
 Cultivator when writing the advertiser.

**THIS WEEK'S COVER**

California breeding and Califor-  
 nia service is shown in the illustra-  
 tion on the cover. Perhaps Califor-  
 nia is not an ideal state for the breed-  
 ing of the very heavy drafter, but the  
 work of our farms, with now and  
 then a dependable animal for sale, is a  
 factor for every farmer to consider.  
 Gasoline will never do it all.

**PATRIOTS AND TRAITORS**

There are all kinds of believers  
 in peace. We believe it was ex-Presi-  
 dent Taft who said that he was a  
 peace-at-any-price man, but just now  
 the price of peace was war. The ma-  
 jority of the people of the United  
 States agree with our president and  
 ex-presidents in that the world needs  
 the best services of the people of this  
 nation to preserve democracy to the  
 earth. This is a country in which the  
 majority rules, and every true patriot  
 yields to the majority and does his  
 best. We believe the nation has no  
 more disloyal people than those who  
 are preaching the pacifist doctrine  
 so as to in any way lessen the most  
 efficient service of our army and  
 navy.

**BUY EARLY**

We have referred to the neces-  
 sity of anticipating another season's  
 needs in the matter of implements,  
 machinery and fertilizers by ordering  
 as early as possible: Now comes the  
 state council of defense and adds that  
 not only is it wise to have in hand  
 the original implements but a supply  
 of parts for repairs. Every day shows  
 the probability of still further exten-  
 sion of the war, and the demands up-  
 on America another year may be as  
 great, probably greater, than this  
 year, and even when the war ends the  
 demand upon agriculture will be  
 heavy. The nation is learning what

its unpreparedness means, and the  
 lesson should be taken by every pro-  
 ducer.

**SUDAN**

Note Mr. Nelson's article on  
 third page of this issue. Sudan hay  
 is not the equal of alfalfa, but under  
 California conditions it is proving a  
 remarkable feed producer. It is possi-  
 ble to sow it even yet and get heavy  
 return this season.

Our state university suggested sev-  
 eral weeks ago that as we were all  
 going to potatoes and beans it might  
 be well for some to stop and consid-  
 er that our live stock would need  
 some feed, and thousands of acres of  
 sorghum grains have been planted  
 as a result of that campaign, but sor-  
 ghum grains and even the fodder  
 which comes from the growth of sor-  
 ghums are not sufficient, and the sup-  
 plementing of that supply with hay of  
 the Sudan type will make wealth for  
 the growers.

**PRAY EXCUSE ME**

Citrus growers of Cuba and the  
 Isle of Pines have started a move-  
 ment to prevent the imposing of a ten  
 per cent duty on citrus fruits, as was  
 originally proposed in the war tax bill.  
 It was afterwards stricken out of the  
 bill and the United States citrus grow-  
 ers took steps to secure its return.  
 The Island growers thereupon peti-  
 tioned the president of Cuba "to take  
 up this subject with the department of  
 state at Washington and endeavor to  
 prevent grave injustice to the citrus  
 fruit growers of this republic, who  
 will be forced to abandon a business  
 still in its experimental stage, if fur-  
 ther burdens are to be placed upon  
 their shoulders."

It appears to us that the people of  
 the United States have taken upon  
 themselves some burden in the effort  
 to extend and guarantee democracy  
 and that our southern neighbors may  
 well afford a slight tax to aid in this  
 great movement.

**BANK INVESTIGATION.**

Investigation as to conditions in  
 the farm loan bank at Berkeley was  
 scheduled for last week. We believe  
 it has been finished, but no informa-  
 tion has as yet been given to the  
 public.

This institution was established for  
 the benefit of farmers, and farmers  
 and farm papers should be the last to  
 embarrass in any way the free action  
 which looks to the best interests of all  
 the producers, but the establishment  
 of a rural credits system to enable  
 greater production and improved prop-  
 erty is not a war measure, at least  
 not to the extent that we may appre-  
 hend an enemy lying in wait to se-  
 cure inside information and use it  
 against the nation. We are all vital-  
 ly interested in the success of the  
 federal farm loan bank located at  
 Berkeley. It is our institution and  
 should not be used as a politicians re-  
 ward, and if politics is not entering  
 into its management, why may we not  
 all be informed as to its innermost  
 workings?

**SPECIAL FAIR DAYS**

We note in many Eastern coun-  
 ty fairs the custom of devoting one  
 day to the agricultural specialty of  
 the section in which it is held. For  
 example, one county fair in Missouri  
 will observe Jersey Day when a pro-  
 cession of Jerseys parades the prin-  
 cipal streets, ending up in front of the  
 grandstand on the fair grounds. Oth-  
 er sections observe Cotton Day,

Strawberry Day, Guernsey, Holstein  
 Day, and so on. This not only appeals  
 to the pride of the people of the com-  
 munity but manifests the advantage  
 to come from community unity of ac-  
 tion.

This perhaps could not be so effec-  
 tive in a state fair, but in California  
 might not Yolo County well have her  
 Holstein or Almond Day, in which spe-  
 cial attention might be called to her  
 principal crops? Fresno would, of  
 course, have her Raisin Day, River-  
 side her Citrus Day, Imperial her Cot-  
 ton or Duroc-Jersey, or Cantaloupe  
 Day.

**FITTING LIVE STOCK**

There is no agricultural fair at  
 which live stock is exhibited but the  
 remark will be heard: "Yes, it is an  
 exceptionally fine animal, but look at  
 its condition." Many farmers are able  
 to raise a fine quality of stock but are  
 not able to make it show its better  
 points to others.

There has been complaint that over-  
 conditioning of hogs, taken often  
 great distances to fairs, is a mistake,  
 and it is perhaps true that some er-  
 rors are made on that side. One of  
 the best hogs in the state fair last  
 year, because of excess fat and the  
 hot weather, lay down and died. This  
 may be true in certain cases but  
 there are more unfitted animals than  
 there are those which receive too  
 much fitting.

We note in some Eastern fairs fit-  
 ting contests are becoming popular,  
 that is, individuality or breeding are  
 not considered in the judging, but  
 merely the ability of the stock breed-  
 er to put his stock in proper exhibi-  
 tion condition. These are proving  
 especially attractive to boys clubs.  
 Sometimes the condition of the ani-  
 mal before fitting is taken into ac-  
 count by the judge, then after proper  
 time is allowed for the fitting a score  
 card judging takes place. A point for  
 California fairs to consider.

**TRACTORS ARE COMING**

The tractor factories of the  
 United States will have an output for  
 1917 in excess of 67,000 tractor and  
 self propelled implements. This in  
 spite of high prices and almost im-  
 possibility of securing steel. This ef-  
 fort of these manufacturers is one re-  
 ason why the farmers of the country  
 have been able to respond so nobly  
 to the appeal for greater production.

California tractor manufacturers  
 and dealers are in the advance of the  
 procession. We note the California  
 Association, with headquarters at  
 San Francisco, is discussing plans for  
 attracting attention to their wares at  
 the state fair, and also already plan-  
 ning for a great demonstration to take  
 place at the university farm in the  
 spring of 1918.

The Southern California Associa-  
 tion, following up its successes of last  
 fall when it held one of the greatest  
 demonstrations of the West at Puente,  
 is now planning for a great demon-  
 stration to be held in the eastern out-  
 skirts of the city of Los Angeles. An-  
 nouncement of this is made on another  
 page of this issue, and from the par-  
 ticulars there given it may be seen  
 that all Southern California dealers  
 are united in a great event. In fact,  
 it will in part take the place of the  
 district fair which was to have been  
 held at Agricultural Park in Los An-  
 geles, for not only will there be dis-  
 plays and field demonstrations of trac-  
 tors and all kinds of farm machinery  
 and implements, but even furnishings  
 and appliances for the rural home.

**ENLARGING ITS SCOPE**

The California Milk Producers  
 Association, with headquarters at Los  
 Angeles, has an ambitious program  
 for benefiting milk producers' organi-  
 zations, which has been of great benefit  
 to the producers of Central and South-  
 ern California. Mr. Ayers has been  
 its secretary and manager for several  
 years, but on Tuesday reorganization  
 took place and Tom H. Brice is the  
 present secretary and manager.

**Agricultural News Notes**

The corn belt needs rain but as yet  
 the crop has not suffered.

This fall's International Dry Farm-  
 ing congress will be held at Enid,  
 Oklahoma.

The United States exported \$35,000-  
 000 worth of fruits and nuts in ten  
 months ending in April.

The Mexican government has in-  
 creased the export duty on wool to 40  
 cents Mexican gold per kilo.

A \$2,000,000 shipment of coffee has  
 been received in San Francisco for  
 supplying the American army.

The movement of Texas onions to  
 market is over and heavy shipments  
 are now commencing from New Jer-  
 sey and Kentucky.

Nearly 4,000,000 acres are cultivat-  
 ed to olives in Spain and the value of  
 the fruit and oil is estimated at \$40-  
 000,000 a year.

Careful comparison of figures from  
 various corn belt farms shows that it  
 costs to produce an acre of corn about  
 \$15, or 50 cents per bushel.

L. A. Goodman of Kansas City, Mis-  
 souri, for years secretary of the state  
 horticultural society, recently died at  
 his fruit farm at Goodman, Missouri.

President Wilson has issued an em-  
 bargo on exports from the United  
 States of coal, food, grains, meats,  
 steel and other products except by  
 license.

New Zealand is an apple producer  
 to be reckoned with. In May a Na-  
 tional Apple Show was held at Dun-  
 edin where more than 1000 entries  
 were made.

The United States exported more  
 foodstuff during the month of May,  
 1917, than any month in its history.  
 The value of the shipments for the  
 month was \$104,000,000.

Herbert C. Hoover has established  
 the fact that between wheat at har-  
 vest time and finished flour in con-  
 sumers' hands there are in this coun-  
 try \$159,000,000 in profits.

Shipments of cantaloupes from Cal-  
 ifornia and Georgia for the week of  
 July 3 to 10 were this year nearly  
 double last year's for the same period.  
 The total for the week was 1256 car-  
 loads.

Switzerland is experiencing an in-  
 creasing demand for Indian corn, ow-  
 ing to war conditions creating a short-  
 age of wheat and rye; also the Swiss  
 are beginning to learn that it makes  
 good eating.

Michigan will have an immense  
 grape crop. Its grape belt produces  
 about 3000 carloads of grapes an-  
 nually. There are more than 200  
 farm loan associations in the three  
 states of Missouri, Illinois and Arkan-  
 sas, served by the federal farm loan  
 bank at St. Louis.

Barbers of Indiana are suggesting  
 that some substitute for the egg sham-  
 poo must be supplied. One barber has  
 figured that there are about 300,000  
 barbers in the United States and that  
 each of them averages about one egg  
 shampoo daily which would mean  
 100,000,000 eggs wasted. Moral: Go  
 bald and win the war."

The Horticultural Club of Trinidad,  
 British West Indies, has arranged to  
 have loaves of bread baked from ba-  
 nana flour prepared at local bakeries  
 and offered for public sale in order  
 that the people may have an oppor-  
 tunity to know that a most palatable  
 bread can be made from banana flour.  
 The bread is made from two parts of  
 banana and one part of wheat flour.  
 The banana flour could also be used  
 as a substitute for oatmeal porridge  
 and for making puddings.

# Agricultural News Notes of the Pacific Coast

## Northern California

Eldorado County is organizing a farm bureau.

Yolo estimates she will produce 600 tons of sorghum grains.

A carload of spring lambs was sold at Wheatland recently at \$9.35 a head.

J. W. Adriance has been appointed farm adviser, his district to be assigned later.

Sack sewers are receiving five dollars per day. The heavy work makes his job a most strenuous one.

One apple grower of Butte County recently shipped 35 tons of apples, principally Astrachans and Gravensteins.

Sacramento Valley's output of grain this year will be greater than at any time since the days of the grain wars.

The Placer County Growers' Canning Organization at Lincoln has purchased 100 carloads of canning apples.

County Horticultural Commissioner Amiman of Shasta County proposes to start an active squirrel fighting campaign.

The Anderson-Cottonwood irrigation district six per cent bonds, totalling \$68,000, have been sold to a San Francisco firm at a premium.

Vacaville has shipped out nearly 600 tons of fruit for the season. This is more than 150 less than last year, largely because of the later season.

The state council of defense has notified Governor Stephens that plans have been formed for supplying labor to all sections of the Sacramento Valley.

It is claimed that beavers have made dams in the irrigation system of the Farms Land Investment Company in Yuba County so that dynamiting has been necessary.

A new forest ranger's station is being erected in the mountains back of Red Bluff, the original station having been destroyed by rocks from the water of Mt. Lassen.

Hauling of farm crops of Yolo County has put such a strain upon the bridges that the board of supervisors has instructed the county surveyor to inspect and report on their condition.

The Yolo Democrat says that Yolo County farmers' applications for federal farm loans have been held pending settlement of dissension within the management of the farm loan bank.

A conference of California agriculturists with Carl Vrooman, assistant secretary of agriculture, is being held this week in San Francisco. The effort will be to devise methods of marketing this season's crop.

The management is pushing for a county fair to be held at Auburn, Placer County, in September. J. A. Lagarden is chairman and J. A. Livingston secretary of the committee in charge of preparations.

An effort is being made to secure construction of a dam in Iron Canyon near Red Bluff through government and state appropriation. If carried out the plan will mean the reclamation of large tracts of rich land.

A farmer at Willits recently sold 600 pounds of wool at close to 60 cents. Because of shortage of labor thousands of acres of alfalfa are being stacked instead of baled. In fact, many fields make a showing of great quantities of hay still in cocks.

## Central California

Daily shipments of apricots are being made from Mountain View.

Stanislaus County farmers are paying 25 per cent increase in wages.

Several good catches of fine salmon are being made in the Kings River.

Madera County reports serious injury to ripening apricots by beetles.

Hanford, Kings County, says the 1917 county fair will be the finest ever.

Prune dryers and yards are being fitted for one of the biggest crops ever.

San Joaquin County potato growers report stock rotting in the ground for want of help.

Some farmers over the San Joaquin Valley are reporting excellent returns from Sudan grass.

The Associated Raisin Company and the Prune and Apricot Growers' Association are affiliating, the plants of the Associated being used to receive consignments for the Prune and Apricot Growers.

Mountain View, Santa Clara County, is planning for a prune and apricot show to take place September 21, 22.

The second animal live stock show and exposition is to take place at Modesto the week after the state fair at Sacramento.

The Prune and Apricot Growers' Association is conducting the largest business on the smallest capital of any institution in the state.

A Tulare County potato grower is suing a Stockton commission house because of failure to purchase potatoes at an agreed price.

The board of trade of Turlock, Stanislaus County, is making a survey of dairy cows within six miles of Turlock and finds there are over 3000.

The shipping of cured peaches from Dinuba, Tulare County, begins this week. Grape shipping from Tulare County sections will begin about the first of August.

The Oakdale Irrigation District of Stanislaus County has fixed upon an hour per acre as the unit for irrigation of alfalfa. Each rancher is entitled to 15 second feet.

Hog buyers in the central part of the state are urging farmers to produce more hogs, and the producers of "more hogs" are urging the hog buyer to produce fair return for the hogs already produced.

The state viticultural commission is giving Eastern fresh fruit buyers assurance that standardization of the California fruit pack will mean a dependable brand on every crate of Emperor grapes which goes out.

Seven hundred sixty-six cows of the Stanislaus Cow Testing Association won place on the honor roll of that association by producing 1.5 pounds of butter fat daily for the month of June. The best cow of the association produced 2.17 pounds, daily average for the month.

At the meeting of the directors of the San Joaquin County farm bureau early in July the matter of closing saloons as a war measure was discussed and the directors found themselves hopelessly divided. All agreed that it was the only way in which the farmer's interest could be protected.

## Southern California

A \$50,000 glaze fruit factory is being erected in Los Angeles.

Movies have been taken of the Imperial Valley apricot industry.

Potato growers are organizing in all sections to secure just returns.

Imperial Valley cantaloupe shipments will end within a few days.

Potato growers are greatly pleased at the present advance in prices.

J. D. Huston is said to be the first Torrens title owner of Imperial County.

Orange growers are planning for intercropping their orchards so far as possible.

Three thousand cutters are working in the apricot yards of Hemet, Riverside County.

Desiccated vegetables will be the output of a large plant being erected in Los Angeles.

Grover Loftus succeeds W. E. Packard as president of the Imperial County farm bureau.

Riverside County is running full handed on apricots while waiting for the tomato season to open.

Imperial Valley hog raisers are posting signs warning owners of diseased herds not to trespass on their places.

Grain producers of the Moreno, Riverside County, section are securing an average of 20 sacks of barley per acre.

Grain thieves are taking away truckloads of grain from some of the grain sections of Southern Riverside County.

War prices are making potash manufacture at the Riverside Portland Cement works one of its profitable features.

The long staple cotton gin at Blythe in Riverside County is installing new machinery to be ready for this fall's picking.

The farm centers at Jurupa and Glen Avon, Riverside County, are planning for exhibits at the coming Riverside fair.

Some apiarists near Highlands, San Bernardino County, lost heavily from "melting down" of honey comb during the recent hot wave.

Pomona dry yards, under control of growers and installed at the last moment to save local fruit, will handle about 400 tons of apricots.

Five associations have separated from the Semi-Tropic Fruit Exchange and organized the Northern Orange County Citrus Association, with headquarters at Fullerton.

Ventura County bean straw did not all go for fertilizer. Some of the black-eye straw goes for the manufacture of a fiber, one company making it a business to put out this material.

El Cajon, San Diego County, recently shipped a car of lemons to Chicago, which netted five dollars per box. Another car of Valencia oranges sold close to three dollars per box.

C. P. Claussen will soon be in charge of the state insectary at Alhambra. One of his first activities will be the installing of colonies of parasites for the citrus mealy bug.

Calipatria, Imperial County, has harvested 200,000 sacks of barley on land which a year ago was almost entirely desert. Besides this she has a grain sorghum acreage of about 11,000 and cotton acreage of 18,000.

## The Coast

Yuma, Arizona, is planning for a county fair.

Orange County's bean crop will be far above normal.

The Wenatchee Valley cherry crop is reported exceptionally large.

The Colorado River flood season is passing and the river is slowly subsiding.

The Coachella Valley has gone the pig clubs one better and is organizing calf clubs.

The stock range of Arizona is showing more serious loco poisoning than for several years.

It is estimated that Idaho will produce 1600 cars of prunes and 2500 cars of apples this season.

A live stock specialist of the University of Arizona is urging more general vaccination to prevent blackleg.

An association of Idaho wool growers has been formed, over 600,000 head of sheep being represented by the membership.

The state of Washington has a new forest control law requiring owners of forest lands who do not live thereon to employ a patrol.

A sale of pure bred Holsteins at Palouse, Washington, recently netted an average of \$225, with \$530 for the highest priced cow.

Citrus growers of San Bernardino County are taking steps to secure from the board of supervisors a lower valuation on citrus groves.

The official tester for the Chehalis district cow testing associations reports 600 cows averaging over 45 pounds for the month of June.

The board of supervisors of Yuma County, Arizona, has passed an ordinance providing for an expense fund for a county agricultural agent.

Owing to excessive rains many potato fields in Whatcom County, Washington, rotted before starting. The crop will be lighter than anticipated.

Oregon prune growers have decided to hold for six cents, and buyers have withdrawn from the market until a price more satisfactory to them can be named.

Obstructions in the bed of the Colorado River are diverting the channel to the Arizona side and away from the Hanlon heading which supplies Imperial Valley.

Redlands tomato growers are complaining because the price paid by canners is but little higher than that paid last year, while retail prices are immensely greater.

Twenty-six boys of Spokane County pig clubs have 156 pure bred pigs for sale. It is asserted these club members are giving points to the farmers of Spokane County.

Farmers of the Northwest are inclined to hold their wool for still higher prices and warehouse companies are urging immediate sales of at least a portion of the clip.

A county cow testing association in Idaho finds its average around 29 pounds per month. As some of the cows run above 50 pounds plainly there needs to be much elimination.

Water users under the Roosevelt dam in Arizona and owners of lands who have use of water only in seasons of excess are in conflict over use of excess waters for producing this year's crops.

## Borrow for 36 Years

**R**ECOMMENDATION has been made by the federal farm loan board that all of the federal land banks limit their mortgages, so far as possible, to 36 years. Under the law mortgages are permitted to run for five to 40 years at the option of the borrower, but the 36 year maximum has been recommended by the board because it will greatly simplify the keeping of records.

A mortgage given for 36 years at five per cent may be wiped out during that length of time by annual payments equal to six per cent of the principal. The average interest rate on farm mortgages throughout the United States, under the old regime, has been 7.4 per cent. That rate was for interest alone. At the expiration of those mortgages the entire principal fell due.

Under the farm loan act annual payments of only six percent will take care of both the interest and principal and the borrower will never have his mortgage fall due, and never be compelled to meet any payment in excess of six per cent of the principal.

The federal farm loan board has also recommended that these amor-

tization payments be made semiannually, which means that three per cent on the principal will be paid every six months.

The minimum loan granted under the farm loan act is \$100. To retire a mortgage of \$100 in 36 years the borrower would make semiannual payments of \$3.00 each. With that as a basis any borrower or prospective borrower in the United States is able to compute his semiannual payment on a mortgage of any size up to \$10,000, the maximum permitted under the act. For instance: If the proposed loan should be for \$1500, the borrower would simply divide \$1500 by 100. The result would be 15. He would then multiply 15 by \$3. The result would be \$45 as the semiannual payment to retire interest and principal, a 36 year mortgage of \$1500 at five per cent.

It should be borne in mind that any borrower under this act is permitted to pay off all or any part of his mortgage after it has run five years. So the borrower who takes his mortgage for 36 years gets the benefit of smaller payments during the first five years and then has the privilege, after five years, of paying all or any part of it in amounts of \$25 up on any interest paying date.

## Eastern Markets

**I**N the report of the bureau of markets as to conditions the country over we note:

The supplies of fruits and vegetables as a whole are abundant and steadily increasing as the season advances. The season in most producing sections is about a week later than last year. Prices are steadily declining. However, the level of prices is considerably above that of last year. This does not apply to cantaloupes, which are cheaper than last year, watermelons which are about as cheap, or homegrown vegetables, which are appearing on all markets in abundance and are as cheap as last year.

### Potatoes

Potato shipments from Norfolk and the Eastern Shore of Virginia continue heavy this past week, and with movements starting from Kentucky and Kansas, shipments were about 900 cars above those of last week. Potato prices rose during the middle of the week of July 10 to 17, but are now declining with prices about the same as a week ago. Norfolk and the Eastern Shore of Virginia potatoes are now jobbing on large markets at \$3.75 to \$5.75 per barrel, as compared with \$1.50 to \$2.75 last year at corresponding time.

### Georgia Peach Movement

During the past week 1409 cars of peaches were shipped out of Georgia, mostly Elbertas. So far this year 3252 cars of peaches have been shipped out of Georgia as compared with 2351 cars to corresponding date last year and 3087 cars, the total for the season last year. Peach shipments during the past week were nearly double those of the previous week. However, total peach shipments to date are below those of last year due to lateness of season in Arkansas and Texas this year. Georgia Elbertas are jobbing for \$1.50 to \$2.50 per crate, a drop of 50 cents from the price of a week ago and about 25 cents higher than last year at corres-

ponding time. The estimated production of peaches in the United States is 43,500,000 bushels, an increase of about 15 per cent over last year.

### Watermelons

Watermelon shipments for the past week were 3676 cars, or about three times as many as during the previous week or for the corresponding period last year. The heaviest movement was from Georgia and South Carolina. Total watermelon shipments to date were 11,824 cars as compared with 10,170 cars last year to corresponding date. With increased shipments prices have dropped markedly especially for small sizes.

### Cantaloupes Not as Plentiful

Cantaloupe shipments for the past week dropped off about 300 cars from the previous week. Total shipments of cantaloupes to date have been 6277 cars, or 431 cars less than last year at corresponding time. California cantaloupes movement is now declining. The shipments to date are 4855 cars as compared with 4646 cars last year to corresponding date. Shipments from Arizona, Georgia and North Carolina are now increasing. California cantaloupes are holding firm at about the same prices as a week ago, though still considerably less than last year at corresponding time.

### Bulk of Tomatoes From Tennessee

Tennessee shipped 284 cars tomatoes last week, which was considerably more than from any other section. Movement from Texas is about over. Texas tomato shipments to date have been 1287 cars as compared with 1140 cars last year to corresponding date and total for the season. The tomato movement is starting from New Jersey and East Shore of Maryland and Virginia.

### Onion Supplies Less Than Last Year

Shipments of onions for the past week were nearly double those of the previous week, but considerably less than last year at corresponding time. Texas onions continue to ap-

## Rosin Spray

For Mealy Bugs, Scale, Aphids, etc.

Makes Good

### READ THIS LETTER

FREEMIRE & NICHOLS,  
Agents Pacific Soap Co.,  
Ontario, Cal.

Gentlemen—As you are handling the P. S. C. Spray in this territory I desire to advise you that I have used this spray in the past for black aphids in peach trees on my 20-acre ranch on Sixth street, and am pleased to state that I have been unable to find any aphids on the trees since the spraying.

If you desire I shall be very glad to have you bring any people, who may desire to look over results, out to inspect these trees, and can assure you that I can only speak the very best words for the Spray.

As far as I am personally concerned I believe this spray to be very effective for killing this black aphid.

Very truly yours,  
(Signed) J. W. MACRUM,  
805 N. Euclid Ave.,  
Ontario, Cal.

Try P. S. C. Rosin Spray for scale on citrus trees, Kentia Palm scale, or mealy bugs. Our representative will be glad to call on you to explain the merits of this Spray, or we will send a sample on request to responsible growers, if name of dealer is enclosed.

Sold in tins, kegs or barrels.

Write for prices and booklets.

pear in small lots, but movement is chiefly from Kentucky, Eastern Shore of Virginia, and New Jersey. F. o. b. prices of onions from the Kentucky producing section are reported \$2.65 to \$2.75 per barrel, a raise of about 40 cents per bushel from the previous week.

#### Other Fruits and Vegetables

Supplies of new apples are considerably heavier than last year with heavy movements from Delaware and Illinois.

Early cabbage shipments for the past week amounted to 224 cars, considerably more than last year for corresponding period.

These prices and shipments are for the United States as a whole and, unless otherwise stated, are jobbing prices, (that is less than carlot prices on large lots to jobbers) as received daily by telegraph from the principal markets of the country.

## Farm Names

**I**N the issue of June 16 the California Cultivator had an article regarding farm names and registering under the farm and villa act, also the trademarking of names. We now have further information from H. M. Standerwick of the department of state, giving list of names which have been registered under the farm and villa act. Those who may wish for their farms or homes a distinctive name will find this list of particular value.

#### YOLO COUNTY PUFFED UP

The state council of defense has issued to the press a statement in which is: "The example set by Yolo County in increased crop production and all-round patriotism is being commended for emulation to other counties of the state by the state council of defense and by Governor Stephens," and then follows with "Some Things Yolo County Did." "Raised crops worth \$20,000,000; increased its crop production approximately \$7,000,000 over that of last year; subscribed to liberty loan to the extent of \$47 for every person living in the county; contributed to Red Cross more than a dollar for each inhabitant, and other good points regarding the performance of the county. Yolo County's crop production now averages \$1400 in food stuffs for every inhabitant of the county.

## Live Stock Notes from Northern California

Written for California Cultivator By W. S. Guilford

### THE JOY OF THE WALLOW

THE hog that has access to a clean mud wallow or an irrigation ditch or a concrete wallow seems to be about as happy as it is possible for an animal to be during the hot weather in interior California.

I do not see how any one can advocate "dry lot" conditions for hogs in this section if they have ever had an opportunity to observe animals kept without and with some place in which to cool off.

A hog in a dry lot just lies and pants, and the fatter the animal is the more it seems to suffer. But when it can get the surface of its body covered with mud or water so that the cooling effect of evaporation can be felt, it is not unreasonable for a human being to wish to be a hog.

July 15, 1917 was the hottest day recorded in Willows so far this season, 112 degrees Fahrenheit. Humans were very much distressed, yet I saw a lot of hogs of all sizes and ages lined up along the edge of an irrigation ditch, and they did not seem to mind the hot weather at all.

The hog is very susceptible, both to heat and to cold. As soon as the cool weather comes it will keep entirely away from the wallow that is so inviting in summer.

Moisture and shade are two things that pay big dividends to the hog raiser in summer.

### HOT WEATHER DAIRY SUGGESTIONS

The intensely hot weather of July and August is apt to cause a considerable falling off in the yield of butter fat from cows in the warmer interior. Anything that may be done to add to the comfort of cows during this period will add to the amount of the milk check.

Provision should be made that the animals be able to feed during the night and the cool of the morning and evening. Then make some kind of a shelter from the sun for them during the middle of the day. A darkened shed on the north side of a big barn is a good place. Darken the doors and windows with sack curtains if no better way is available. Then be sure that plenty of fresh water is available all the time.

There are preparations that when sprayed on the cows will keep the flies off, that can be used to advantage where feed is high in price and where labor is available for applying it.

It is so hot sometimes during the summer, and there is so much work to do, that one hardly has time to think—this is just a reminder that may be worth a lot to many dairymen who can arrange something for the comfort of his cows without much trouble.

### BIG SILO BUILDING CAMPAIGN

Over 60 silos are either being built, or are contracted for, in one county in the Sacramento Valley. And many more will be built before the end of the season. There has been a good deal of silo talk throughout this district for the past four or five years, but the one big factor that is influencing farmers to build silos is the demonstration of their worth that has been made by the silos that have been used one, two and three years.

A great deal of milo and feterita will

be put in silos this season, while the acreage in Indian corn has been greatly increased.

Practically all of the silos being built are of staves—and of one or another of the standard, well advertised kinds. These have made good, and the increase in sales this year must be very gratifying to the manufacturers.

While silage is useful for young cattle, beef steers, sheep, and to a certain extent for hogs, the dairy cow is

the animal that gives greatest returns for silage and is responsible for the big silo industry.

Practically all of the silos are being built on dairy farms. The manure from the dairy cows applied to alfalfa land where the stand is thin makes possible very heavy yields of corn. On heavy lands that have been badly treated, rotating corn and alfalfa—with the addition of plenty of manure to the alfalfa stubble—is bringing many small farms up to a very high state of production.

The silo is indirectly responsible for making increases in farm values of over 1000 per cent, in values based on the amount of revenue secured from the land.

## Caroline of Chilmark

Caroline of Chilmark 24812, one of the three cows composing the Guernsey herd of G. W. Wilder's private dairy at Redlands, which was the foundation of the herd of over 100 Guernseys at present at Hollow-Hill Farm, has just finished an official yearly test of 15,185.91 pounds of milk with an average of 4.76 per cent and making 722.97 pounds of butter fat.

She is a daughter of that great bull,

clared by experts to be almost the ideal type of dairy cow. She has a wonderful conformation, with a deep chest and a great spring of rib which very clearly shows her relationship to Imported Masher's Galore. Her udder is large and well placed and her milk veins are very prominent.

Since coming to California Caroline of Chilmark has dropped one bull calf and four heifers, the last one being born on July Fourth just past.

Caroline of Chilmark, 24182

A great producer, one of the finest Guernseys in the West, owned by Hollow-Hill Farm, Colton, California.

Imported Cora's Governor of Chilmark 8971, which has over 40 officially tested daughters, seven of which have averaged over 600 pounds of butter fat. Caroline of Chilmark's record places her at the head of the list of these daughters. She is a granddaughter of Imported Masher's Galore 8572 and of Governor of the Chene 1297 P. S., two of the most potent bulls of the breed.

Caroline of Chilmark has been de-

The bull, King of Hollow-Hill 25876, is by Itchen Daisy's May King of Langwater 17349, which sold at birth for \$1800 and was lately resold to a California breeder for the record price of \$8000, is the senior herd-sire at Hollow-Hill Farm and is getting some wonderfully fine calves.

It is the expectation at present to show King of Hollow-Hill, Caroline of Chilmark and a number of other cattle at the coming state fair.

## Field Notes from the Live Stock Men

Norman Hale, the English lad who is herdsman for C. N. Hawkins at the Pacheco Shorthorn ranch, San Benito County, has his bunch of show stuff in splendid shape for the fall fair circuit. He says he is very fond of Herefords as he was born in the adjoining county to Herefordshire in the old country and has handled many herds of White Faces, but for a long time now he has been working with Shorthorns and is on the fence. Makes no difference what the breed, this English boy knows his business. He showed Bright Oak, the late A. J. Splawn's cow for several seasons in strong competition and was never beaten in that class. He was also herdsman for C. B. Wade of Hall Lake, Oregon, before coming to California.

The high quality of the Bishop Bros. Shropshire flock is due to practical and proven methods. Instead of

culling after the animals have reached full growth this is done when they are lambs. This concern has over 300 head of registered ewes this year, the largest number since they have been in the business. They are completely sold out of breeding stock for this season which has several weeks yet to run. They carry about 1200 head of range ewes in addition to the pure breds, but the range ewes have been bred to registered rams for 15 years, so they are a classy lot and difficult to duplicate.

The Paicines Rancho is carrying about 700 head of registered cows, and together with their herd bulls headed by the Imp. Champion of Scotland, Paicines has what is considered one of the largest and finest herds of Shorthorns in the entire country. The herd is owned by the millionaire sportsman, A. K. Ma-

## Announcement

### of First Annual Sale of

# PUREBRED BERKSHIRES

Escalon, August 2, 1917

(The day following the Carruthers Sale at Mayfield)

The bred sows and open gilts for this sale have been carefully selected from our herd of 250 pure bred swine. They were sired by Grand Leader 2nd, Solano Emblem and Fashion Longfellow. They will be in pig to Grand Leader 2nd and to Royal Superbus 220200, the great boar we chose to fill the place made vacant when we sold Grand Leader to go East. Royal Superbus carries the same blood lines which have made Grand Leader's get such consistent winners wherever they have been shown. He is, in fact, a half brother to Grand Leader, both having been sired by that great sire, Superbus. Royal Superbus is a very smooth, deep-bodied boar, with good hams and heavy bone.

**ARABIAN THOROUGHBREDS:** Two-year-olds, sired by imported Stallion Ibn Mahrus, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

**SADDLE HORSES:** Some of which were sired by Ibn Mahrus, world renowned imported Stallion. These horses are mostly three-year-olds.

**POLAND-CHINA AND BERKSHIRE BOARS:** Four to nine months old. Sired by famous Poland-China herd boars, Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 6th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

**HOLSTEINS:** We will sell a number of young bulls. Some sons and grandsons of the noted former State Record Cows. Write for details.

## INNISFAIL DAIRY SHORTHORNS

Our herd of registered Shorthorns has been carefully selected from the leading milk producing strains of the breed and is being developed along the same lines in our hands. The herd is headed by

### GLENSIDE ROYAL

a prize winner at the 1913 International and grand champion at Panama-Pacific Exposition. Sired by him and out of large cows of good milk production we offer for sale a few choice young bulls. Our entire herd is tuberculin tested. Alexander & Kellogg, Suisun, Cal.

GLENSIDE ROYAL 408155.

Farm on Grizzly Island.

## Shorthorn Bulls and Heifers

We have twenty bulls and ten heifers for sale at present. This is the best lot that we have ever had for sale. Mostly two year olds, registered, tuberculin tested and all reds in excellent condition and splendid individuals. Write for prices or better come and see them.

H. L. & E. H. Murphy

Perkins, Cal.

# Cheese from Sheep's Milk

Written for California Cultivator

FEW days ago the writer visited a sheep dairy in Yolo County where some farmers were milking about 500 head of sheep and making milk.

The process was unique to say the least.

The dairy barn consisted of an old shed that was divided into pens, the floors of which were the ground covered with about two or three inches of finely pulverized sheep manure. The sheep were driven into these pens in lots of about 50 and run into a narrow but short runway that opened at the opposite end of the shed. In front of the opening, which was just large enough to allow one sheep to pass through at a time, was placed a 10x10 inch timber long enough to allow one man to sit on each side of the opening. A floor was built here with an incline of about 30 degrees, sloping up and away from the timber on which the milkers sat. This upward slant makes it difficult for the sheep to get a foothold, therefore easier to hold while milking.

A boy keeps the chute full of sheep and the elbows of the milkers close the opening so that no sheep can pass out without jumping over the shoulders of the milkers. The milkers sit with a wooden kit between their feet and as a sheep comes out of the chute it is grabbed by a leg with one hand, then with both hands the sheep is grabbed by the bag and yanked into position with its hind feet on each side of the kit and the milking process is begun. The teats and enough

of the udder to fill the hand are grasped and five or six strokes empty the udder. The opening in the teat of a sheep is large and the milk flows out in a stream about a quarter of an inch wide. There is a great difference in the behavior of different individual sheep. Some stand quietly and others keep up a continual highland fling which accounts for the flotsam and jetsam that constitutes part of the content of the milking receptacles. As the sheep spring for the opening when released there is sometimes a shower of miscellaneous material that is thrown into the faces of the milkers, the milk kits receiving their share. A large wash tub is placed at one side into which the kits are emptied when full. This tub reminds us of the description that used to be in our geographies of the Sargasso Sea. Upon inquiry it was ascertained that the milk was strained before making into cheese. It was also ascertained that the cheese made from this milk had a "dis-stink-tive" flavor and sold for 40 cents per pond.

The lambs are allowed to run with the ewes till three months old, when they are taken away and cheese making begins. At that time the ewes are milked twice a day, two men milking 500 in two hours. At that time the ewes average half a pound of cheese per head, while now, in July, the milking has decreased to once in two days with a proportionate reduction in the amount of cheese. The ewes are now being allowed to go dry so as to get them in condition for the winter season.

## Eastern Field Notes

This government is more rigid in its requirements as to horses for army service than were those of the European buyers. No white or gray horses will be accepted; all animals must be absolutely sound. The following prices are being paid for horses and mules for government use: Mature cavalry horses \$180; artillery horses for light and horse batteries, \$195; artillery horses for siege batteries, \$235; draft mules (wheel), \$235; draft mules (lead), \$190; pack and riding mules, \$165.

Illinois has a new dog law calling for a license fee of one to three dollars. In it is the provision that if any dog is discovered in the act of chasing, killing or wounding sheep it is to be pursued and killed; also, any dog trespassing on premises of another and not accompanied by his owner may be killed. Any untagged dog may be killed by anyone wherever seen. The license fees are to be kept as a fund for reimbursing owners of sheep.

A serious epidemic is affecting French cavalry horses. The animals arrive at the field apparently in good condition and often die without any symptoms of disease. It has been suggested that it is a case of poisoning but most careful observation and investigation have failed to show any cause.

The British army sends about 500 horses weekly to butchers of Paris.

York state eggs are commanding about 45 cents per dozen.

New York has enacted a law which puts a premium on the herd of dairy cattle which is free of disease. That is, the idea is to award for clean herds rather than punish or cause loss in

the cleaning up from tuberculosis. The law provides for the payment of 90 per cent of the appraised value of animals which shall be destroyed.

The showing of Herefords at the Calgary Stock Show was by far the largest and best exhibit of the White Faces made in that section of Western Canada. The judging was done by Prof. W. L. Carlisle.

Thompson Brothers, representative breeders of the Hereford in Nebraska, will make an offering of some finely bred Herefords at public sale early in December.

The Texas Swine Breeders' Association will hold its annual at College Station, Texas, August 2 and 3. L. B. Burk of College Station is secretary.

Bob Hall of Columbia, Missouri, is planning a Pacific Coast trip to get in touch with all Duroc-Jersey breeders. He comes as field representative of the National Duroc-Jersey Record Association. Presumably he will attend the state and some of the county fairs where Duroc-Jerseys will be in evidence.

Poultry stealing having become a lucrative practice in many Eastern states poultry people are organizing protective associations and propose to make examples of some of the professional thieves.

In the absence of labor, milking machines are receiving more general attention in Eastern dairy sections.

We note in recent list of advanced registry Ayrshires, Mabel Chalmers, 26726, owned by the Oregon Agricultural College, Corvallis, also Willowmoor Blush, 29461, Willowmoor Brownie, 29457, Willowmoor Soncy Girl, 29470, Willowmoor Bloom, 29463, Willowmoor Vesta 3rd, 29489, Willowmoor Rosie, 29468, Fizzaway's Lady Semolina, 29074, Willowmoor Etta's Pride 2nd, 26003, owned by J. W. Chase of Redmond, Washington, have all secured entry to the mature class advanced registry of the Ayrshire Breeders' Association.

Silo Sense

Here are some sound suggestions made on the subject of silos by W. A. Barr, county agent of Maricopa County, Arizona:

The silo increases the size of the farm from 50 per cent to 100 per cent by increasing the stock carrying capacity.

Cows do not "dry up" when silage is at hand.

Milk costs 25 to 40 cents, and beef and mutton 50 cents to \$1.25 less per hundred pounds to produce when abundant silage is to be had.

The silo conserves the feed produced.

Eight tons of silage require no more space than one ton of hay.

Silage is the most convenient of all feeds to handle.

The silage and alfalfa ration is cheaper and one-third more valuable than alfalfa alone.

Silage is a health tonic to the animal system.

Corn, milo, kafir, feterita, and the sorghums are all good silage crops.

There is no "best" silo. All are good if rightly constructed.

Put up a silo and purchase filling machinery cooperatively with your neighbor.

Book Review

Feed Manual

"Feed Manual and Hand Book," prepared by Professor F. W. Woll, Ph. D., University of California, published by J. B. Lippincott Company, Philadelphia.

"This manual has been prepared with two main objects in view: first, to enable students in agricultural schools and colleges to become thoroughly familiar with our more important feed materials, not only as regards their chemical composition and digestibility, but as to appearance, physical properties, and the various conditions that influence their value for stock feeding, and second, to furnish a guide for the use of the feeds in compounding rations that is both scientifically correct and sound from a practical point of view. The aim has been to stimulate independent thinking so that the facts and principles

brought out may form a part of the mental equipment of the student that will materially aid him in his later efforts to become a successful stockman."

This is strictly a school text book and would have little value for the farmer unless he were making scientific study of feeds. While written by a Californian it has more the appearance of a book with an Eastern viewpoint. For instance, in the exercises and notes on feeding stuffs there are pages devoted to alfalfa, to timothy, meadow hay, to clover hay, oat straw, corn silage, etc., but no page for making of notes on the barley or other grain hays which are such a factor in west-of-Rocky Mountain sections.

Keep the pigs growing, for each day passed without some gain in weight is a loss to the feeder.

Show Herd of Berkshires to Be Sold

Lovers of high class swine of any breed, and particularly Berkshires, will have a rare opportunity to secure stock for either foundation or show purposes at the second annual Carruthers Berkshire sale, Mayfield, August 1.

Mr. Carruthers has fairly outdone himself in selecting 44 head of sows and three great herd boars for this sale. It will be remembered that last year's sale made the highest average of any Berkshire sale in America, and it is the consensus of opinion that this year's offering is even a better one than that of 1916.

The sows are indeed a wonderful lot, 32 head ranging in age from under a year up to three years, are bred to the best boars on the place and are due to farrow from September 1 on. Here is a chance for the buyer of foundation stock as well as established breeders. A perusal of the breeding of these sows shows how richly they are bred, but their individuality stands out as prominently as their breeding.

The dozen odd open gilts in this sale are a smooth, growthy lot that will attract sale goers. Quite a number of these gilts weigh over 300 pounds and are not yet a year old.

Mr. Carruthers is offering three outstanding herd boars any one of which should come pretty close to breaking a price record when they are led into the ring. Mayfield Champion, a February, 1916 boar is one of the best animals the proprietor of Mayfield Farm has ever offered for sale. He is a grandson of Rival's Champions Best on his dam's side and carries the blood of Gregory's Matchless Baron

Duke on his sire's side. His sire, Ames Rival 70th, is one of the best boars on the coast. Mayfield Rival 24th is a remarkably fine under-year boar sired by Ames Rival 121st who is a son of Rival's Champions Best, out of Premiers Successor. His dam is a line bred Rival's Champions Best also so that he is an intensely line bred animal in this family. This boar will be a winner on the show circuit and will probably be exhibited by the lucky buyer. The other boar is Iowanna Rival Majestic by Rival's Champion and out of Matchless Lady Majestic, a noted show and breeding sow. He was farrowed March 3, 1914 and is right in his prime. Great credit is due John Meyers who has had charge of the Carruthers herd for the splendid, thrifty condition of the sale animals. They are neither over or under-done but just right. As field representative and feed expert of the American Berkshire Association Mr. Meyers has a wide reputation.

No other Berkshire event on the Coast to date will have had so many visitors present of national reputation. Dean Curtiss of Ames, Iowa, will be there; Professor Plumb, department animal husbandry, Ohio State University; DeWitt Wing of the Breeders Gazette; J. E. Barker of Indiana; L. E. Frost of the Berkshire World; and many others. Sale will be called promptly at 1 p. m. August 1. Col. Seely of Whitehall, Illinois, will cry the sale. Mayfield can be reached by either Southern Pacific trains or motor buses from San Francisco or San Jose every hour. Whether you buy Berkshires or not it will be worth while to mingle with many of the country's notables in swinedom.

2nd Annual Sale  
BERKSHIRES

CARRUTHERS FARMS  
MAYFIELD, CALIFORNIA

WEDNESDAY  
AUGUST 1st  
1917

Sows are bred to Ames Rival 100, son of Rival's Champion Best; Iowanna Rival Majestic 3d, a son of Rival's Champion; and Mayfield Champion, son of Ames Rival 70th.

44 Sows and 6 Boars

In this sale will be included ten sows and two boars, comprising the best show herd that has ever left Carruthers Farms.

Entire Show Herd will be Sold

Remember A. B. Humphrey's Berkshire Sale, to be held at Escalon on August 2nd

A GREAT DAIRYING COUNTY

One of Yolo County's greatest industries is that of dairying and the worth of her dairy cattle has been made known the world around. But dairying is not all for this year she proposes to raise crops worth \$20,000,000, a \$7,000,000 increase over last year.

## We will Reward You With This Great Book

Everybody can have a copy under our liberal offer.  
Send for yours today.

### Greatest Book on Feeding.

"Feeds and Feeding", by Henry and Morrison, is the recognized standard authority on the feeding of dairy cows, beef cattle, calves, hogs, horses and sheep. The authors at great expense and with much time and labor, have compiled the most important findings of the investigators of both the Old World and the New in the science of animal nutrition, together with the vast number of feeding trials, conducted in California and the experiment stations of other states, the whole being rounded out by the practical experiments of many of the leading stockmen of America.

### Latest Edition.

This is the latest edition containing the new chapter "Economy in Feeding Live Stock" and much other information recently found by investigators in this and other countries.

701 PAGES—Cloth bound and full of  
Valuable Information

## How to Get Best Results Feeding California Barley

"Feeds and Feeding" is a large volume, 701 pages in substantial cloth binding, clearly printed in large type and written in plain, understandable language. It is intensely interesting throughout and represents the sum total of hundreds of experiments, trials, and record tests on practically every feeding combination ever attempted and the personal experiences of the authors and many other noted feeding experts from California to Maine.

Full and complete information is given in regard to the feeding and feed value of California barley, how to obtain the best results, and giving the results of many barley feeding tests. (Pages 162, 308, 309, 360, 414, 454, 525, 590.)

## We Are Going to Give These Books Away

READ OUR OFFER TO YOU

If you would know feeds, their value, what to feed, and how, get this neat book, that thoroughly covers the subject. With the information it gives at your command, you can cut many dollars from your feeding cost.

### Only takes a Little Time.

You can obtain one of these valuable books at no expense—just a few minutes' easy work. To any reader of California Cultivator who will secure for us only three new yearly subscriptions to California Cultivator at \$1.00 each—the regular subscription price, we will send a copy of the latest edition of "Feeds and Feeding" by Henry and Morrison. If you want to buy this book it will cost you \$2.25 anywhere. You know California Cultivator and how much valuable information you get from its columns each issue. You receive the best thought and experiences of many of the West's most authoritative writers. The results of many tests and experiments and the live stock, dairy and agricultural news of what is going on over the entire Pacific Coast at a cost of only \$1.00 per year. Your neighbor, if he is not already a subscriber, will be glad to have you show him a copy. You can get three new subscribers at \$1.00 each quickly and easily. Send us the \$3.00 and the subscribers' names and addresses and we will send the book to you postpaid. You may include your own subscription by paying a full year in advance of this date and including two new subscriptions at \$1.00 each. There must be at least two new subscriptions for one year.

Address all orders to

CALIFORNIA CULTIVATOR, 115-117 N. Broadway, Los Angeles

## Silage for Hogs

Written for California Cultivator By W. S. Guilford

**A**NY silage that contains a large percentage of grain is readily eaten and relished by hogs. They eat the grain part and seem very fond of it, but my experience indicates that the leaves, stalks and other fibrous parts of the corn are mostly wasted.

At Butte City Ranch Indian corn silage has been fed to the Berkshires several different times with the result stated above. It might be that if silage was fed in small quantities to hogs that were very short of feed, they would eat a greater percentage of the mass than these hogs.

Whenever silage is being fed to sheep or cattle a small quantity is al-

ways fed to the hogs; it gives a variety to their ration and there is an indefinite something—hard to describe—that makes a feeder believe that it is good for hogs and that it may have an action as an appetizer or an aid to digestion that gives it a higher value than an analysis would indicate.

I have heard of specialty hog farms where silos have been built as a part of the equipment and where silage was to be figured as one of the principal feeds. I have never seen one of these farms, but if any Cultivator reader of this has such an establishment, I am sure that there are many who would be glad to learn of it through the columns of this paper.

## Conservation Suggestions

In thinning sugar beets it sometimes happens that part of the beets become of fair size before they are taken out. Could not these be canned in the same way as spinach? Frequently a considerable portion of a field is taken out and it would seem as though these beets and tops might be treated the same as spinach, which goes about three tons to the acre and for which the canneries pay about \$20 per ton. Also, we have found that when dried beet pulp is well cooked and treated like mashed potatoes it makes a palatable dish. Is there any reason why it should not be shipped to Europe to help out with the short supply of potatoes? Would like to ask regarding drying the small potatoes, of which there seems to be a plentiful supply this year. If these were cooked and dried would they not make a good article of export?—John Eastwood, Oxnard.

Regarding thinning young beets we believe the suggestion of Mr. Eastwood is most excellent. For us there is no better "greens" than tender young beet tops. Along this line we may quote from a recommendation of the National Emergency Food Garden Commission:

"Beet tops for greens should be canned the day they are picked. Sort and clean very carefully and blanch in steam 15 minutes either in regular steamer or in other vessel so arranged that the greens may be suspended above an inch or two of boiling water. After blanching plunge beet tops into cold water for an instant, then cut into desired lengths and pack tightly

into jars. Add hot water to fill jars and season to taste. Partially tighten tops of jars and sterilize for an hour and a half. Remove jars from hot water, complete sealing, and place in an inverted position out of a draft to cool.

"The small beets taken out of the rows in thinning may be canned with the greens and are very palatable if served in this manner. The process is the same as for canning the tops." For best results the beets should be selected as uniform in size as possible.

The dried beet pulp is another proposition. However, it is worth trying out in time of scarcity of food. Let us hear from homemakers who have tried it. The method of curing potatoes was given fully in the issue of July 21, 1917. In a word it consists of peeling, slicing about a quarter of an inch thick, then treating with the fumes of sulphur and drying. When ready to use soak 24 hours and cook as fresh potatoes.

### KILL THE SQUIRRELS

Horticultural Commissioner Marchbank of Madera County is after the squirrel and the squirrel owner. On the owner he is serving notice that the Madera County squirrel destruction campaign begins September 1 and if owner, rancher or one controlling land in that county does not have the pest removed from his land within 30 days from September 1 he will be prosecuted in accordance with the law governing destruction of ground squirrels. A copy of the interesting portion of the law is also served on the owner with the notice. Squirrel owners must bear in mind that they are liable to a fine of \$500 or to six months in prison, or both, for harboring this pest.

Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 81,000 readers, weekly. Liner rates: Single insertions 3c per word; yearly contracts 2½c per word. 35c per issue minimum charge.

TREES

Here is Your Opportunity to Secure A1 citrus trees. We offer several thousand 2-year-old lemons; Eureka and Villa Franca, also Washington navel; also several hundred Valencia on sweet root. We call these good trees and we know whereof we speak. ALBERT JACKSON, Upland, Cal.

By Far the Lowest Priced means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator. The cost is only 3 cents per word per issue, with a minimum of 35 cents.

For Acacias, Avocados, Budded Loquats, Citrus trees, Evergreens, Feijoas, Palms, Roses and all kinds of trees, shrubs, vines, etc. Write for our new catalogue. Robertson Nurseries, Fullerton, Cal.

Eureka Lemon Trees—Best quality. Fine root system. No frost trees. Grown at San Dimas. Special low price. Smith Citrus Nurseries, 320 Marsh-Strong Building, F. 2729, Los Angeles.

Citrus Trees—All kinds, any quantity. Butler's Morning Side Nursery, La-manda Park, Cal.

Avocado Seedlings, in flats. Write for prices. Newberry-Sherlock, R. D. 2, Pasadena, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

WANTED

Wanted—Man in each California county to represent established California company. Should have rig or auto to get around. Good pay and several weeks' work to right parties. Address J. H. Yetter, Sales Department, 810 Santa Marina Building, 112 Market St. San Francisco, Cal.

Wanted—Position as dairy foreman or herdsman by experienced man. Understand compounding rations and productive feeding. Will get results for employer through modern efficient methods. Box O, Cultivator.

One of the Most perplexing problems to farmers and ranchers is that of help. A small liner ad in California Cultivator is the quickest and easiest means of securing farm help.

We Buy Weed Seeds—Mustard, rape, anise, bitter clover, etc. Send samples. Write us, stating quantity and price. Globe Mills, Los Angeles.

Wanted—To buy new or good second hand smudge pots, seven to ten gallon preferred, Dunn or Scheu type. Address Box 298, Corona.

Wanted—Five hundred feet second hand seven or eight inch irrigating pipe. Wm. Fiege, Healdsburg, Calif.

Wanted—Second-hand Holt caterpillar, 60 or 75 h. p., two speed transmission. Will F. Phillips, Terra Bella.

Wanted—To buy "ewes." Healthy, 150 yearlings or about 125 2-3 year. G. Holst, Redwood City, California.

FARM LANDS FOR SALE

For Sale—A Bargain!! In the great Antelope Valley: 80 acres of fine soil within ½ mile of best producing hay and bean ranches. Good 3 room house, young orchard, 1¼ acre, with water piped to it, barn, horse, cow and chicken corrals. Windmill on good domestic well. Water at 18 feet. Fine shade trees. Nice home to move into. \$45.00 per acre, no less, no trade. Owner, Box A, Rosamond, Cal.

For Sale—Four acre ranch with 3 room and bath, new, modern cottage and large garage with sleeping room, fronting on paved boulevard. Family orchard, 80 walnut trees, chickens, rabbits, ducks, and furniture if wanted. Water piped for irrigation and domestic purposes. Electricity. Rich sandy loam soil. Price \$7000, including Ford delivery truck. Part cash and 6 per cent on balance. Geo. W. Snider, Chatsworth, Calif.

For Sale or Exchange—74 acres sandy loam, planted to alfalfa and beets, near factory and towns on good roads, near school. Splendid water, modern buildings, electric lighted, ornamental shade and fruit trees. F. G. Easton, Manteca, Calif.

For Sale—20 acres improved, rich, level land; irrigating and domestic water, implements, some crop and poultry. Near town and school. Price \$3500, terms, \$1000 cash, balance 5 to 20 years 6 per cent. A. C. Heald, Alpaugh.

Oregon, California Government Lands. Latest Green Booklet Free. Tells "How, Why, Where." Write Joseph Clark, Sacramento.

POULTRY

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We will immediately. National Poultry Co 307 E. Third St. Los Angeles, Cal.

Day Old Chix—Barred Rocks, Rhode Island Reds, Black Minorcas, Brown Leghorns, Buff and White Orpingtons. Other popular breeds a matter of correspondence. Enoch Crews, Seabright, Calif.

300-290 Egg Leghorn, Wyandottes, Rocks, Reds, Anconas, Orpington, Pullets, Cockerels, Breeders, Guernsey profit makers at bargain. C. Beeson, Pasadena, Cal.

'Eastman's Bred-to-Lay' Barred Plymouth Rocks, Fairmead Poultry Farm, Fairmead, Cal.

HORTICULTURAL PRINTING

Catalogues — Good Printing. Specialists in preparing nursery, seed, poultry and live stock catalogues and all kinds of commercial printing. For prices and information address WOLFE PRINTING CO., 115 No. Broadway, Los Angeles.

HOGS

Chester Whites, the Billiken Brand.—Your duty is to raise more hogs and increase the meat supply. The demand for pork exceeds the production. Get started with some of these Chesters: 3 bred sows farrowed in April, 1916, due to farrow in September, and October; 18 October gilts due to farrow in October; 3 October boars ready for service. All first class in every respect and good enough to fit and show at the different fairs this fall. All are cholera immune and will be registered free. Write for price list and booklet. C. B. Cunningham, Box C, Mills, California.

Grape-Wild Farm Berkshires — World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Large Yorkshires—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

Superba, World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

Rancho Rubio Durocs. Only a few September gilts left. One carking good fall boar by Orion Model, son of the last international grand champion. Place your orders now for weaned boar pigs. Best I ever raised. Elmer Lamb, Ceres, Cal.

Wanted—Farmers, orchardists, livestockmen to use classified liner advertisements like this. Thousands of people read every ad and the cost is only 3 cents per word per issue, minimum 35 cents. Extra lines of white space above and below cost only 16 cents per line.

Choice Berkshires—We are overstocked with young hogs, boars and gilts by Artful Duke 32nd, Rancho Otto and Ames Rival 131st from prize winning sows. We are offering some fine bargains to early comers. Hollow-Hill Farm, Colton, Calif.

Duroc Jerseys—Grand Golden Model is sired by the Champion Grand Model. His dam is by Golden Model 2nd. Peters, Lamson & Walker, Devore, San Bernardino County, California.

Big Type Durocs. Well grown out February and March pigs of either sex in any quantity. We ship only the tops and butcher the culls. F. M. Johnson, Napa, Cal.

Cholera Immune Duroc-Jerseys. Big type. Weaned boars and gilts from 500 to 700-pound sows. Prize winning stock. Derryfield Farm, I.O.O.F. Temple, Sacramento.

Crawshaw's California Chinas are prolific and profitable. Weanlings \$15.00, boars \$25.00. Dr. J. A. Crawshaw, Hanford, Cal.

Poland-China Swine Recorded. Stock for sale at all times. We please you or refund your money. W. A. Young, Lodi, Cal.

Most Money in Duroc-Jerseys. Bred sows and weanlings, either sex all the time. Delta Farm and Live Stock Co., Colton, Cal.

Choice Boar Pigs for Sale. Sired by Superba 220620, champion Poland boar at San Francisco. Prices right. C. R. Hanna, Riverside, Cal.

Large Yorkshires—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

Duroc-Jerseys—Few choice March males from best eastern stock. Reasonable prices. W. M. Taylor, R. D. No. 1, San Bernardino.

One Large and two medium type boars, extra choice, 9 and 10 months old. W. Bernstein Ranch, L. C. Trewhitt, Mgr., Hanford, Cal.

Model Herd Berkshires bred for size and quality. Weanlings and gilts. J. L. Gish, Laws, Calif.

Carruthers' Farm Berkshire Hogs. Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

Berkshires—Two hundred pounds at six months. Ray C. Hannan, Corning, Cal.

Poland-Chinas—A few good breeding boars. S. F. Williams, Orland, Cal.

AGRICULTURAL IMPLEMENTS

Large Assortment slightly used and agents' sample plows, harrows, cultivators, wagons. Call and see them before buying. Save 50 per cent on some. Four floors. Largest stock. Arnott & Company, Ranchers' Supply House. 117 to 118 South Los Angeles St., Los Angeles.

PATENT ATTORNEYS

Patents that protect are secured through the PACIFIC COAST PATENT AGENCY INC. Savings & Loan Building, Stockton, California; send for our little booklet on "PATENTS"

Patents—Copyrights, trade marks and labels registered. Solicitor of American and foreign. James R. Townsend, 712 San Fernando Bldg., Los Angeles. Phones, Home A4619, Sunset Main 347.

Venadera Jerseys, the herd with official yearly records. Calves of both sexes for sale. Guy H. Miller, Route 1, Modesto, Cal.

Young Holstein Bulls, bred right, grown right, priced right. Creamcup Herd. M. Holdridge, Modesto, Calif.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

Holstein Bulls from record cows. Prices right. A. M. Bibens, Modesto, Calif.

MACHINERY

WHY BUY NEW? SAVE HALF Material guaranteed. It's second hand after used few times, but not worn out.

Let the wind do it. 8-ft., \$27.50; 10, \$35; 12, \$55; 16-ft. mills \$125, cost new \$285. Pump as much as 4 h. engine for nothing once installed. Why buy gas?

TANKS—TANKS New, used tanks, guaranteed; 1500-gal. galv. with cover, \$22.50; 16,000, \$250; 10,000 redwood, \$75. SOME TANK. Big 100,000 gal. redwood storage tank, round lug hoops, cost \$1200, our price \$400 before we move. Has mile of lug hoops alone on tank, also has low stand. Be quick. See who's cheapest.

Engines, Pumps, Pipe Centrifugal pumps; plunger pumps, \$5 up; Big Bulldozer single acting jacks, \$68; double-acting No. 3 Ames, \$225; cost \$660; Means double-acting deep well pump, \$275; Large Addison double-acting plunger pump complete with 85-ft. 10-in. pipe, 9-in. swell brass cylinder, double rods, pumps 50 in.; outfit cost \$1500; snap at \$475; 9-h. p. Foos, \$135; 8-h. 12 Fairbanks, \$165; 6-h. Stearns, \$89. Many other first class engines very cheap.

Brass cylinders, Plunger rods, pipe. Fittings, Ranch Machinery, Sundries. Fine, 2-gang mouldboard plow, \$45; 3 or 4-gang disc tractor plow; alfalfa renovator, \$25; 24-disc, 4-horse harrow, \$38; mowers, buck rake, feed cutter, \$8.50; bone grinders, \$6 to \$12; feed mill, \$10.50; water trough, \$4; cement mixer, \$25; sprayer, \$19.50; new discs, \$1 each.

Wanted to buy first class material. No junk wanted. Pioneers in our line. DEMMITT CO., Office Upstairs, 120 N. Main. Yards, 816 Yale, Los Angeles.

For Sale—Samson Sledge-Grip tractor, eight horse pull, just overhauled. Tractor tools; Clark 8 ft. double cutaway disk, Forkner spring tooth 10½ ft. cultivator, and a cross reach orchard wagon. All in first class condition. \$850 cash. Address J. W. Errant, Highland and Sycamore Avenues, Rialto, California.

Several new and slightly used engines at a bargain. Best makes. 1 to 35 h.p. Arnott & Company, Wholesale Machinery and Implements, 112 South Los Angeles St., Los Angeles, Cal.

SEEDS AND PLANTS

Tepary Beans for Sale—Twelve pounds will plant an acre. Will mature in 65 days from seeding. Seed very scarce. We have on hand a limited quantity which we offer, ten pound lots at \$2.50; hundred pounds \$20.00 F. O. B. Tucson. Tucson Seed Company, Dry Climate Seeds, Tucson, Arizona.

\*\* ORDER YOUR SEEDS NOW \*\* If you are going to need any seeds for next season now is the time to render your orders. It may be impossible for you to buy what you need later. V. A. Peterson Alfalfa Seed Co., Arbutuck, Cal.

\*\* ALFALFA SEED OUR SPECIALTY \*\* Seed Potatoes—A limited supply of Burbank, American Wonder and British Queen for August planting. H. A. Hyde, Watsonville.

MONEY TO LOAN

Money to Loan—On improved farms, city property or for building loans, also on cattle or cotton crops. C. G. Paul, 206 North Glendale Ave., Tropic, Cal.

MISCELLANEOUS

Slacked Lime—Send for sample and information. Price right. Let me help you. H. B. Matthews, 350 Woodberry Road Pasadena.

For Sale—Ice box suitable for store, hotel or dairy, galvanized lined, capacity 900 lbs. ice. Hollow-Hill Farm, R. F. D. No. 1, Colton, Calif.

To Reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco

Send One Dime, receive 25 cent cake best skin and scalp soap, postpaid. Healing Soap Co., 1704 Oregon St., Berkeley, Cal.

RABBITS

Raise Rabbits For Us—We sell you foundation stock and buy back what you raise, paying \$1.75 and \$2.00 each for them. Send 25c for our proposition, our book on rabbit culture and our supply catalog. Gilmore's Rabbit Farm, Dept. C, Santa Barbara, Cal. (The rabbit farm of international reputation.)

LUMBER

Lumber—Sash — Doors — Plumbing Supplies—Building Materials of all kinds, new and 2nd hand. \*A.\*R.W. Shingles 50c per bundle. Send list for estimate. Dan P. Dolan, 1670 Mission Street, San Francisco, Cal.

A FARM LETTERHEAD

"Where grow a few hogs and a little corn." These words have an honest conservative, and wholesome ring. They appear under the owner's name in a farm letterhead which came to us the other day. On one side, and less pronounced, is a brief list of the live stock and farm products which the owner raises. It makes the letterhead impressive and much more individual than usual. Originality counts in letterheads as well as in other heads, and the reader of such a letter gets a wholesome impression of the owner, his farm and his business, from just these few simple words. How much better than glowing statements in the letterhead; the kind that are usually taken with a grain of salt. Even a busy editor catches the nicety of such an approach, and prospective buyers and business men must feel that here is a man it will pay to respect.—Orange Judd Farmer.

NONSENSICALS

The farmer broke his wagon  
When his horse began to buck;  
But he was most resourceful,  
And used his garden truck.—Widow.

Another broke his legs, sir,  
Before he'd sowed his crops,  
Who showed himself resourceful  
By going in for hops.—Mercury.

The farmer is resourceful  
And knows what is best to do  
By going in for hops,  
But not for making brew.

This farmer made another break.  
He planted hops so tall  
That he tumbled when he picked them  
And now cannot hop at all.

It's plain that these are farmers wise  
To make things grow so fine.  
Of course they read the "Cultivator"  
And digest every line.

REALLY CAPABLE

"How's your boy Josh getting on at the training camp?"

"Wonderful," replied Farmer Corn-tassel. "I feel a sense of great security. An army that can make Josh willin' to get up early, work hard all day an' go to bed early kin do anything."

MATTER OF YEARS

Editor—And you say this joke is original with you?

Humorist—Certainly.

Editor—Well, you don't look it.

Humorist—Don't look what?

Editor—Four hundred years old.

EASY ENOUGH

"Well," asked the doctor, "how did you find yourself this morning?"

"Oh easy enough," answered the patient. "I just opened my eyes and here I was."

It pays to keep up the appearance of the premises.

## The Cultivator Patterns

8415—Children's Dress. Cut in sizes 2, 4, 6 and 8 years. The dress has separate bloomers and the dress is to be slipped on over the head.

8151—Ladies' Shirt-Waist. Cut in sizes 34 to 42 inches bust measure. Any of the pretty striped materials can be used for this waist.

8159—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. Blouse has an inset vest and long or short sleeves.

## Household Department

### VERSE GRATIS

I'm not just sure,  
What verse libre is,  
But I've a speaking notion,  
That it may be something,  
Just like I feel,  
Or worse—  
But no—that could not be,  
For I feel bad—oh, very bad,  
Not in one place,  
But all over—  
Why!  
It's simple,  
Look at my face,  
See how the perfectly good skin,  
Is all peeling off,  
And the patches of it,  
Are not a patching,  
To what is coming off,  
In great slabs and chunks,  
From that poor back of mine.  
You guessed it,  
I've had a vacation,  
And been to the beach,  
And besides oceans of flea bites,  
And tons of sand,  
That I carried home  
In my clothes,  
Or anywhere  
It could be concealed,  
I'm sunburned.  
The sun didn't burn, my poor skin  
And let it go at that,  
But it just cooked it,  
Until every nerve connecting,  
That skin with the place in the brain,  
Where it hurts,  
Is all exposed, and sore and raw,  
And I'd just as soon be all dead,  
As suffering the torture,  
Of being just live enough to hurt.  
All over,  
And dead otherwise.  
The next time the boss,  
Asks me  
If I want a vacation,  
I'm going to tell him,  
That if he is anxious to kill me off,  
There are more pleasant ways,  
And yet,  
I did have a grand time,  
And I guess this won't last long,  
And I believe that,  
I would go again tomorrow,  
Yes, I know I would,  
Gee—I wish I could.—  
—Redlands Review.

### KEEPING COOL WITHOUT AND WITHIN

Written for California Cultivator  
By Jeannette

OUR editor is surely to be congratulated on the correlation of the last three topics given for our discussion. Of course it is not accidental, but not even forethought always produces such happy results.

If we follow the suggestions of the economists in the first symposium in preparing staple foods in a simple way instead of making elaborate dishes; in putting aside rich puddings, cakes, and above all pastries until Thanksgiving and Christmas time, substituting in their stead bread puddings, custards, corn starch and fresh fruit and berries, we shall have taken quite a step toward keeping cool this summer.

The precepts laid down by the savers of strength in the second discussion are even more timely, particularly the counsel to make our brains save physical effort, for it takes a lot of thinking to keep ourselves and our families comfortable in the heat in which we now move and have our being.

Most country women do not need the advice to get up early in summer time. That is one of the musts of her day, and a very good thing it is too. There is nothing like the freshness of the early summer morning. It brings a breath of vigor and strength that lasts throughout the day and foolish is she who misses it.

I not only try to get as much as possible of my harder work done before the heat of the day sets in, but to do the greater part of my cooking for the day as well. Some of my stand-by dishes for hot weather are stuffed eggs, served in dish lined with crisp lettuce leaves, cottage cheese, cold meats, though we use meats sparingly in hot weather, and salads of all kinds. Cooked salad dressing can be prepared in sufficient quantity to last several days. If kept covered in the cooler it will keep perfectly. Everything needful can be prepared in the

morning and a few minutes at meal time produces a most delicious dish. Here are two more combinations which my family like:

Cook macaroni in salted water until tender, pour off about half the water and set in cooler. At meal time add a can of beef soup and simmer for a few minutes. Prepare rice as above and before serving add can of chicken soup and teaspoon of curry powder. I do not favor the use of many canned goods from the store, but soup used as seasoning I have found both convenient and economical.

Much of the difficulty of summer cooking is solved for the happy possessor of a fireless cooker. My cooker is yet on the "ship that's coming in" if it doesn't run into a submarine. Of course we can't have all the delightfully convenient things the magazines tell us about all at once. If our desires were all satisfied where would be the joy of anticipation?

However, I think that every woman, whose job it is to cook for a family in this heat, should be provided with at least a good oil stove of not less than three burners. It not only reduces the heat of the kitchen but saves that everlasting "stoking" which is so nerve trying when it is hot.

If you haven't a refrigerator or a patent iceless cooler by all means have a desert cooler. I made one myself the other day, so if the handy man, like the rest of his kind, is too busy for odd jobs these days, you need not wait for his leisure. I first made a framework the size I wanted my cooler, with solid top and bottom held together by uprights at each corner. This frame I covered with an old blanket which had been washed until all the nap was removed. A baking pan which nearly fitted the top was filled with water, and strips of the blanket were placed in the water and allowed to hang down the sides of the cooler. Capillary attraction keeps the strips and through them the sides of the cooler damp. If placed where the air can circulate about it it serves the purpose of a refrigerator perfectly.

I hope you all have a screened porch for a dining room, or at least a substitute. However, I am strong for the porch, for the oak in the yard sounds inviting but is apt to mean too many steps.

On a very hot day one way to have a cool porch dining room is to hang burlap dipped in water over part of the screen. Sprinkle the floor just before you announce the meal, and the members of your family will drop into their seats with a sigh of relief.

It is a very much lighter task to keep our bodies comfortable than to keep our minds at even temperature these days. As to the financial worries, high prices and scarcity of food I think we all talk on these subjects too much. Many students of the situation believe the danger of food scarcity has been exaggerated. The continual agitation gives unscrupulous dealers a lever by which to raise prices and goodness knows they do not need any help along that line.

Whenever you feel panicky go out and work in your garden and plan your canning campaign. Growing plants are always calming in their influence. They are so blessedly impersonal. They ask no impertinent questions and they flourish alike for all who supply the conditions of their growth.

A calm soul is hardest of all to maintain just now. It hardly seems possible to keep cool within when we think of all war means, but we can at least be sanely excited if we read the better class of magazines, and not depend altogether on the daily newspaper for our information. Such writers as Irwin Cobb, Carl Ackerman and Will Irwin give one a sane view, and though they leave one deeply stirred, arouse to a high plane of thought and feeling that forbids hysteria. The English women have set us a splendid example of coolness and efficiency. If we are to be real patriots we must do our best to keep calm minds and hearts that we may do our part for our country in her need.

### CARRY SOME

In order to leave footprints in the sand of time you must have a certain amount of sand.—Philadelphia Record.

KEEPING COOL, OUTSIDE AND IN

Written for California Cultivator  
By Mrs. W. L. Cunningham, Windsor

**I** HAVE lived for 30 years in good, old Sonoma County, and during that time have encountered some hot weather. Where the grape thrives and oranges and lemons grow in abundance, hot weather is essential, yet I have generally managed to keep comfortable under the most trying heat. Do you know how? By keeping busy, a great panacea for all humans.

I begin in the morning to make the house cool by having all windows and doors wide open, causing a current of air to circulate through every room. (My windows and doors are screened). Each room, where permissible, is darkened. On the outside, garden and surroundings are kept well watered, and under a glorious live oak many a lunch is spread and enjoyed. This same old tree serves as a sewing-room; for, after household duties are completed the women folks there take their sewing, crocheting, and the innumerable small things a woman finds to do; and there is a picture of coolness and content because of busy brain and hands.

Cool porches, shady trees, fireless cookers, etc., play their part; but they are no comparison to keeping occupied the mind and hands. Just try keeping busy, you people who suffer from the heat, and I am sure it will prove to be a case where you will say:

"Never mind the weather  
We're young and happy now,  
Boys and girls together,  
Hurrah! Hurrah! Hurrah!"

KEEPING COOL ON A DESERT HOMESTEAD

Written for California Cultivator  
By Mrs. G. A. Bisbee, Edom

**I** AM very busy woman, busy because I like to be busy. We are only two, myself and husband, but occasionally I drop down in an easy chair to rest a bit and read something, as I did this morning, and what I read was the household helps in the California Cultivator.

The thought came to me: Do all the housekeepers who might profit by others' experiences, live in the city or on some ready made ranch with most if not all of the comforts and conveniences, which most people think they can not live without, or do some of them live in the desert on a homestead as I do?

I know they do, and it is for these that I am in hopes of lightening the many cares which come to those who are fighting their own way in a perfectly new land, new at least to civilization.

One of the hardest things I had to learn was that it is impossible to keep house and keep it as I like to keep it and as I always have kept it.

Our house is a very well built house, but I found that the sand storms could cover everything with sand much quicker than I could uncover them. By putting away all unnecessary articles about the house and by cleaning house only after a sand storm I was more contented with my lot and could do some of the pleasant things which I was compelled to leave undone before, from lack of time and strength to do them.

Having conquered this ordeal, I also learned to not resent the sand storms so much for the weather is cooler after a blow.

This brings me to the other great condition which we have to contend with—the terrible heat through at least three months of the year.

Some people come to the desert (as we did) without knowing anything about how to care for their stock, their food or themselves to prevent loss and suffering. I hope something I may say will make things easier for those contemplating this life in the future.

Do not think that you have done all that can be done for your chickens in hot weather if you have given them plenty of food and water to drink. Have a clean ground for them in the shade and wet the ground thoroughly. The circulation of air over the wet ground will bring your chickens through the hottest weather.

See that your dog also has a damp place to lie on and a place to take a frequent dip.

If your team work is done when there is even the slightest breeze,

they can work even in the middle of the day.

Move your bed clear out in the open; it is much cooler than on the porch or under a tree.

I used to rush around and do all my work early in the morning before it got hot. Now I get our breakfast over and do some things which can not be done in the heat (like churning), and then I gather up strength for the rest of the day by enjoying the cool side of the house. I think it is easier to do a little cooking in the middle of the day (when you would be hot anyway) than to do it earlier when you might otherwise be comfortable. Take frequent showers, and a damp cloth over the head will be a help at times.

I was told when we came here that it was impossible to make butter during the summer. This and many other things are made possible with the aid of the air cooled cupboard which I think is familiar to most people, a burlap covered cupboard kept damp and placed where the air will blow through it. Flour and cereals of all kinds should be bought in small quantities as the loss is great caused by weevils getting in them.

Test out some of these things for yourself, "Desert Pioneers," and don't go off to some place where you might be more comfortable but less happy (for where can you be happier than at home) and leave your husband to do all your own work in addition to his own and get along the best way he can.

KEEPING COOL

Written for California Cultivator  
By Mary M. Casey, Pasadena

**A**FTER the many good articles published in the Cultivator recently on "saving strength," we ought to be better prepared to keep cool, for wise planning and less hurry and worry will surely be of help.

In Southern California the extremely hot weather seldom lasts over a week, so one can afford to play lazy a few days, even if the neglected work does seem urgent.

By rising at daybreak and preparing a light lunch of salad and fruit and sandwiches (which can be eaten picnic fashion) and a dinner all prepared in the early morning so it will require little effort to serve at night, a good start is made for a hot day.

Then the children who are too young to help can be called and a substantial breakfast served, dishes washed, beds made and house "brushed up" so it will do, for the house is cooler all darkened, and a little dust will not be noticed.

We prepare orange and lemon ade and put in fruit jars by the ice, and a cool drink is ready without the muss and effort later in the day. Then it ought to be possible for the busy housewife to rest a little while before lunch and feel rested enough to enjoy a picnic with the family; and how the children do enjoy anything that seems different, even if it is hot and they are only at home under a shade tree, dressed in rompers, and mine considered it like an outing at the beach when I let them put on their bathing suits and put the fine spray of the hose on each other.

By wearing light, loose clothing, hiding the thermometer, and getting interested in a good book or a piece of work we felt sure we would never have time to finish, we shall feel comfortable during the day, and with a cool sponge bath on retiring, we are assured of a night's sleep in good old California.

KEEPING COOL—OUTSIDE AND IN

Written for California Cultivator  
By M. W.

**T**HE only time the heat bothers me is when I get lazy. There! I have let my secret out.

I have a summer kitchen, a gasoline stove, refrigerator, and electric iron. These are helps. I wear sandals and bungalow aprons to take the place of dress and apron. They are cool and comfortable.

As for the things I do: I keep ice water in bottles in the refrigerator—no ice wasted you see. I serve a cold lunch at noon. Dinner is at 7 p. m.

But for the one great thing that relieves me of hot weather suffering—it is work! Yes, just common, everyday housework. I have a large house to take care of, five people to cook for, two of them ranch workers who have to have three hearty meals a day.

When they are working I rise at about five-thirty; otherwise I do not get up till late. I do not find that it makes much difference.

In the morning I do my housework, trying to get such work as ironing and baking done while it is cool. In the afternoons, having no housework, I sew—not fancy work, that's "loafing"—but make garments, keep at work all day, at least all afternoon. It won't break you down—I am only a school girl, very tiny and not strong at that and it isn't hurting me.

Don't rush; take your time. If you need rest, or want to write or read, do it in the morning when it's cool. If you think you have more housework than I do, go slow and take all day to do it in. It won't kill anybody, say, if some of the beds which are out of sight are not made up till afternoon. Or if on the other hand you haven't enough to do—lucky woman!—no sewing, etc., why go down to Red Cross headquarters and help them out. The thing to do, however, is be sure to keep at work during the hot part of the day. I have tried both ways, and this is the only cure I know. The only person who suffers from the heat in this household—and we live in one of the hottest sections of the state—is my kid brother, who has practically nothing to do.

AUGUST PRIZE CONTEST

For the August contest we will have something different, not a household problem or a problem of any kind, not even recipes, but animal stories, dog stories, horse stories, cat stories, stories of birds, geese, pigs, wild ani-

mals. Everybody who has ever had a pet has stories of its cleverness to tell.

Cash Prize

For the best short animal story the Cultivator will give a cash prize of \$2.00; for second best, \$1.00; for all others published three months extension of subscription unless such extension has already been granted in 1917.

Stories will be published in Cultivator of August 25. All should be received in this office by or before Thursday morning, August 16. Please write on one side of paper only.

Send Photograph

If you have a very good clear photograph to illustrate your story it will make it much more interesting. If photograph is sent and you wish it returned, be sure to send two cent stamp with request for its return.

PRIZE WINNERS

The winner of first prize in this month's household contest is "Jeanette" for her article "Keeping Cool Without and Within." The second prize goes to Mrs. G. A. Bisbee of Edom for "Keeping Cool on a Desert Homestead."

All others whose articles are published will receive a year's extension of subscription to the California Cultivator.

The reason I like a rooster is because he has the spurs to back up his crow.—Josh Billings.

ECONOMY

An oil cook-stove is cheaper to buy than a wood or coal stove and it's much cheaper to operate. Meals in a jiffy, and a cool kitchen in summer.

All the convenience of gas—economical for all the year 'round cooking. Bakes, broils, roasts, toasts. Steady, evenly-distributed heat, the best for cooking.

The long blue chimneys prevent all smoke and smell.

In 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

NEW PERFECTION OIL COOK-STOVE

STANDARD OIL COMPANY (California)

MORE BETTER LIGHT

Install a PRIVATE GENERATING PLANT and have ELECTRICITY FOR LIGHT AND POWER. The Uni-Lectric system generates the standard 110-volt direct current, which will operate from 1 to 50 lights. It will run your sewing machine, electric iron, vacuum cleaner, churn, washing machine, etc.

NO BATTERIES—NO SWITCHBOARD

High speed gasoline motor, generator and automatic governor, all complete. Uses standard lamps and fixtures. Can be used for one or more houses.

# What Ails My Hens?

Written for California Cultivator By Jean A. Koethen

**D**IAGNOSIS of poultry diseases is by no means an easy matter. Indeed, it is so far from being easy that many experienced poultrymen simply kill and bury or burn every chicken that dies, without much inquiry into the cause or attempt to doctor the victim. Perfect sanitation is the great preventive of poultry disease, they say. When this has been properly looked after the deaths which occur may be regarded as incidental, something to be expected, deplored, but hardly prevented.

On the other hand it is of the utmost importance that the causes of disease be clearly understood and that the symptoms of common diseases be quickly recognized. Take, for instance, the disease called aspergillosis, a high-sounding Latin name, which merely means "mold-disease." It is easy to understand, when you

stop to think of it, that mold spores, such as one finds sometimes in a sack of heated corn or in bran or middlings that have been wet, when taken into the throat, may often find lodging there and spread as they would in the sack of grain, ultimately reaching the lungs and causing suffocation and death. The first symptoms of this disease are similar to those of a catarrhal cold, but if every keeper of poultry had in mind that back of the catarrh or the rattling in the throat, which is the next stage in the progress of the disease, there might be a condition impossible of cure, he would lose no time in appointing himself an investigating committee to hunt out the exact truth. The fact is, we Americans have such firm faith in the power of medicine that we are very careless about preventing disease. We sleep in unventilated rooms, eat indigestible food, wear unhygienic clothing, and trust that when we are punished for our disregard of the laws of health the doctor will get us off somehow.

This blind faith may do for folks, but it won't do for hens. Disease in the henery must be prevented if possible. If it cannot be prevented, treatment must be prompt and investigation of the cause immediate and thorough, else the loss will be not one hen, but many. The mold in the sack of heated corn may kill one hen, and it may, if not discovered, kill a hundred. All hens are not equally susceptible to any disease, but the fact that one hen in a flock is attacked by aspergillosis is proof that there is a hidden enemy somewhere which may sap the health of the whole flock.

The common diseases of chickens may be roughly classified as diseases of the respiratory organs (throat, lungs, nasal passages and bronchial tubes), diseases of the digestive organs and diseases of the skin. There is another large class of diseases known as diseases of the reproductive organs, including rupture of the oviduct, egg-bound, etc., but these are so rare in comparison with the others that they need not be discussed here. There are also attacks of intestinal parasites, but these are so evident that they need no diagnosis. The presence of intestinal worms in a flock is readily observed and easily, though not always successfully, treated. Diseases of the skin, while there are several, may be dismissed with a single reference to the commonest of them, chicken-pox.

Chicken-pox is a very common disease in warm climates and is always known by the presence of warty excrescences or sores on head or comb. These have not always the same appearance, nor do they always begin in the same way. Usually they begin as flat nodules, gradually increasing in size. They are yellowish-gray or reddish-gray in color with dirty-gray, yellowish-brown or red-brown crust. Sometimes they are small and close together, sometimes larger and farther apart. Sometimes the nodules are on the edges of the eye-lids and sometimes on the cornea itself. Any sort of sore on the head may be suspected

as probable chicken-pox, and the victim isolated and treated.

The commonest disease of the respiratory organs is roup. Roup has several forms, but is always characterized by three things: discharge from nostrils or eyes or both, swellings about the head or eyes, and a peculiar, foul, unmistakable odor. The border line between an ordinary catarrhal cold and roup is hard to define. Some authorities lump all kinds of colds together and call them roup, but the odor is generally conceded to be the one unmistakable symptom. A cold which has no odor is not roup. It may be catarrh or bronchitis or pneumonia, but it is not roup. The swellings about the head are also characteristic and are found with no other form of cold. Sometimes the eyes are affected, and sometimes there are membranes in the throat. There is often, but not always, fever. The bird is usually dull and depressed, but in light cases it may eat and lay as usual.

What is commonly called canker is sometimes associated with roup, but the cheesy patch as sometimes seen in the mouth or on the tongue may come from mold spores, in which case the trouble is not roup but aspergillosis. Again whitish sores about the mouth are sometimes called canker when they are really due to the pecking of other birds. When there are no other symptoms of roup the canker should be laid to one of the two last-named causes.

Rattling in the throat indicates either bronchitis or aspergillosis and calls for a careful examination of mouth and throat for mold patches and of feed and scratching litter for the possible cause of the trouble. Bronchitis is due to exposure or dampness and calls for immediate transfer of the patient to warm, dry quarters.

No other class of diseases is quite as hard to diagnose as those affecting the digestive organs. Indigestion has so many symptoms and affects so many organs that one is always puzzled to know which is most affected. There may be liver trouble, which is indicated by a dark or yellow comb; there may be diarrhoea, sour crop, limberneck. Sometimes the trouble is acute, consequent to the eating of putrid flesh, spoiled beef scrap, or moldy food, and we have ptomaine poisoning, which is almost always fatal unless relieved immediately by a good dose of castor oil. Sometimes indigestion affects the nerves and muscles of the legs, and we have leg weakness, as in young turkeys and fat old hens. Sometimes it affects the muscles of the neck, and we have limberneck. In most cases which are not acute the trouble comes on so gradually that it is not noticed. The hens are fed an unbalanced ration, all hard grain with no meat and little green feed, perhaps, or a ration containing too much indigestible stuff like the hulls of oats or barley, or they are fed irregularly or too much or too little, or a ration containing too much fat-forming food, and little by little the liver becomes clogged and unable to do its work, the comb loses its normal bright red color, the bird becomes dull and mopy. Finally, and usually too late, the owner notices that something is wrong and begins to look for a remedy.

The first treatment for these digestive disturbances is always a dose of physic. In acute cases castor oil is best. In milder ones Epsom salts in moist mash, being less severe, is better. On many poultry ranches a dose of salts is given regularly once a month to the entire flock, just to clear out the liver and keep it normal

Half a teaspoon of salts to each adult bird is a fair dose. Dissolve in water and mix with a medium feeding of dry mash, no more than the birds will clean up immediately. This is the only satisfactory way of giving Epsom salts.

Along with the dose of salts should come a lightening up of the ration. Hens that are severely affected will not eat. Those that will eat should be given a ration largely of greens and bulky feed, like bran, which is quite laxative. In case of liver trouble it is a good plan to turn the birds out for a while and let them forage for their living. Going hungry is mighty good medicine for man or beast, and in these times of high feed prices nothing could be cheaper.

## THE NORTHWEST EGG LAYING CONTEST

The Egg Laying Contest of the Washington Agricultural College, which has been under way for the past year at Pullman, Washington, is nearing its end. Applications are now being received for the second contest. Applications from poultrymen in general were not received until after July 25. Up to that time former contestants were permitted to make their entries. Any vacancy after that date is to be filled by other applicants.

This is one of the most carefully conducted egg-laying contests of which we have heard, and most careful data are preserved, not only as to number of eggs but also as to cost of feeds and other points. Write the manager, Helen Dow Whitaker, State College of Washington, Pullman.

A fee of one dollar per bird for the six birds of the pen is required, three dollars to accompany the application, balance to be paid before October 15.

## NOW COOK SWATTED ROOSTER

"Swat the rooster week" is past and now it's up to mother to cook the rooster that father has swatted. And rooster meat need not be tough meat, either, if it is cooked correctly, says the home economics division at Ames, Iowa.

Hang the dressed fowl up for several days before cooking to soften the fibers, but be careful it does not spoil. Long, slow cooking in moist heat is best for meat that is likely to be tough. The fireless cooker is the best for this. Add one or two tablespoonfuls of vinegar to the water to help soften the fibers. If more rooster meat is on hand than can be used at once, and if the supply of cans is not short, can the surplus meat by the cold pack method for winter use.

Do not always serve boiled rooster; vary the dish. Mix the meat with crumbs, seasoning and eggs and make "rooster loaf," similar to meat loaf. Make croquettes or chicken pie or jelly chicken. Many good recipes can be found, using either gelatin or the chicken aspic to set the stock for this latter. Make a scalloped dish, using chopped meat, rice and gravy.

In case the roosters have not yet been swatted, it is best to separate them from the flock and feed them on a mash of ground oats, bran, shorts and tankage moistened with sour milk. This will help soften the flesh.

## BE ON TIME

"Well, that's enough to try the patience of Job!" exclaimed the village minister, as he threw aside the local paper.

"Why, what's the matter, dear?" asked his wife.

"Last Sunday I preached from the text, 'Be ye, therefore, steadfast,'" answered the good man; "but the printer makes it read, 'Be ye there for breakfast!'"

## Are Your Hen Profits Satisfactory?

If not, there is something wrong; and by adopting the

### "LEE WAY"

the wrong can be easily corrected.

### Cash Prizes

Those who will report to us by December 15th, 1917, the results received from use of the "Lee Way" and the "Lee Way Assortment" during the months August, September, October and November, we offer Cash Prizes for the 15 best reports:

First Prize .....	\$25.00
Second Prize .....	20.00
Third Prize .....	15.00
Fourth Prize .....	10.00
Fifth Prize .....	5.00
Ten Prizes of (each) .....	2.50

## DRY MASH

### The Best Feed on the Market

Has the highest protein at the lowest price, \$2.65 per 90-lb. bag, subject to market changes; see that your hens eat as much Dry Mash as they do grain; feed them lightly of grain in the morning and make them work for it; either have a scratching pen or spade up a part of the ground and rake the feed under; keep "A-1" Dry Mash in a dry form before them all day; about one hour before feeding them their grain in the evening WET their Mash and let them eat all they will; put it on top of the Dry Mash, then feed them all the grain they will eat; this stuffing process will give them a full crop to carry them through the long night of inactivity; analysis is printed on every bag; give it a trial. At Your Dealers or

**The Globe Mills, Los Angeles**

## Right Now use DEVIL'S DUST

and Kill Lice and Mites  
Devil's Dust is a deadly poison to all insect life; harmless to poultry, stock, plants  
**Globe Mills Los Angeles, Cal**

## Mr. Poultryman: TRI-STATE MOLT MASH

will help your hens through the molt and make it possible for you to stay in the business.

SOLD by our agent in each town or inquire of **GLOBE MILLS, LOS ANGELES**, Southern Wholesale Distributors, or **TRI-STATE POULTRYMEN'S COOPERATIVE ASS'N.**, Headquarters, Fresno, California.

## RICE

Price to growers:	
Cal. Rough, cwt.	3.00@3.25
Lower Grades	2.00@2.75

## HAY

Under date of July 21, Scott, Magner & Miller say:

Receipts past week 2291 tons; practically the same as last week, which was 2306 tons.

These receipts are far below the normal for this season of the year. Cars are very scarce and at some points the railroads have absolutely refused to give any box cars for the loading of hay. Local trade is very light. Export trade is light and with the exception of the government hay for shipment to the Philippines, there is nothing doing to speak of. The quality.

of this season's hay is of very superior grade. Stock hay is extremely scarce, with No. 1 grades plentiful. There is no change in the alfalfa or straw markets.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market. For prices to consumers charges of cartage, commission and handling expenses must be added.

Wheat, Fy., lt. bales	19.00@20.00

## Necessary to Order Tractor Now—Don't Wait

Steel and other materials are hard to get and are costing more all the time. No matter when you need your tractor you should order now for future delivery at present prices; \$1150 now buys the lowest-priced tractor of tracklaying type, suitable for orchard and vineyard work. Big crops count today and quick plowing or cultivation at just the right time brings big crops. You want to be ready.

### Bean TrackPULL Tractor Patented Front Drive Principle

There is a great advantage in the front-drive principle of the Bean TrackPULL Tractor. The Tractor steers with the track that pulls. It gets good traction and yet is so light in weight that little power is required to move it—the power goes into the pull. When you steer it you swing the entire front end around just as you swing a team. If you are of average strength you can swing the entire front end either to left or right at right angles with one hand. If you hit a soft spot you just swing her over a little to right or left and keep on going.

#### Weights 3100 Pounds

Its light weight distributed over long traction puts the Bean TrackPULL in a class by itself as a cultivating tractor. It packs the soil less than a man's shoe when he walks. Farmers and growers have come to recognize the folly of rolling down their land with a large, cumbersome outfit which works with difficulty over newly-plowed land and packs the soil unduly.

### Why Try to Get Along Without This Great Little Producer?

It will save you money by saving you the cost of man labor. It will not eat up one-third of what it helps to produce as horses do. It will not be affected by heat or insects. It will cultivate deep in hot weather. It will cost nothing to maintain when it is idle. You can use its belt power to run your stationary machinery. When the opportunity comes to rent an extra piece of land and by quick work put in an extra crop or two, you can work your tractor night and day, if necessary, and turn a handsome profit.

Remember that the Bean TrackPULL Tractor is owned and made by the manufacturers of the famous Bean Sprayers which have proved through years of service to be the staunchest machines of this kind ever built. You can depend on the Bean Spray Pump Co.'s Tractor the same as you can depend on its sprayer.

#### Mail Coupon for Book

Don't take chances if you want to be sure of getting a tractor this year. A lack of materials later may cut down the supply of these tractors or cause an advance in prices. Send the coupon today for full information about the remarkable Bean TrackPULL Tractor. Then decide if you want one and put in your order for delivery now or later. Price NOW \$1150. Get the fully descriptive, illustrated book.

#### In the Orchard

The Bean TrackPULL is at home in the orchard. It is built very low, never damages branches or knocks off the fruit—turns accurately and short and pulls the same load on turns as on straightaway. It makes very little difference how far off center you hitch on the drawbar and, for this reason it is easy to plow or cultivate close to the trees. Trees do not have to be pruned at a greater height than 4 feet when you work with a TrackPULL Tractor. Fruit can be grown closer to the ground and therefore the yield will be greater.

#### In the Vineyard

There never has been another tractor that will work like the Bean TrackPULL Tractor in vineyards. It will work right up to vines without breaking off the young shoots. It can be turned as accurately and in as small a space as a two-horse team. Vineyardists appreciate this close work and this short turning ability.

## We will Reward You With This Great Book

Everybody can have a copy under our liberal offer.  
Send for yours today.

### Greatest Book on Feeding.

"Feeds and Feeding", by Henry and Morrison, is the recognized standard authority on the feeding of dairy cows, beef cattle, calves, hogs, horses and sheep. The authors at great expense and with much time and labor, have compiled the most important findings of the investigators of both the Old World and the New in the science of animal nutrition, together with the vast number of feeding trials, conducted in California and the experiment stations of other states, the whole being rounded out by the practical experiments of many of the leading stockmen of America.

### Latest Edition.

This is the latest edition containing the new chapter "Economy in Feeding Live Stock" and much other information recently found by investigators in this and other countries.

## How to Get Best Results Feeding California Barley

"Feeds and Feeding" is a large volume, 701 pages in substantial cloth binding, clearly printed in large type and written in plain, understandable language. It is intensely interesting throughout and represents the sum total of hundreds of experiments, trials, and record tests on practically every feeding combination ever attempted and the personal experiences of the authors and many other noted feeding experts from California to Maine.

Full and complete information is given in regard to the feeding and feed value of California barley, how to obtain the best results, and giving the results of many barley feeding tests. (Pages 162, 308, 309, 360, 414, 454, 525, 590.)

701 PAGES—Cloth bound and full of Valuable Information

## We Are Going to Give These Books Away

### READ OUR OFFER TO YOU

If you would know feeds, their value, what to feed, and how, get this neat book, that thoroughly covers the subject. With the information it gives at your command, you can cut many dollars from your feeding cost.

### Only takes a Little Time.

You can obtain one of these valuable books at no expense—just a few minutes' easy work. To any reader of California Cultivator who will secure for us only three new yearly subscriptions to California Cultivator at \$1.00 each—the regular subscription price, we will send a copy of the latest edition of "Feeds and Feeding" by Henry and Morrison. If you want to buy this book it will cost you \$2.25 anywhere. You know California Cultivator and how much valuable information you get from its columns each issue. You receive the best thought and experiences of many of the West's most authoritative writers, the results of many tests and experiments and the live stock, dairy and agricultural news of what is going on over the entire Pacific Coast at a cost of only \$1.00 per year. Your neighbor, if he is not already a subscriber, will be glad to have you show him a copy. You can get three new subscribers at \$1.00 each quickly and easily. Send us the \$3.00 and the subscribers' names and addresses and we will send the book to you postpaid. You may include your own subscription by paying a full year in advance of this date and including two new subscriptions at \$1.00 each. There must be at least two new subscriptions for one year.

Address all orders to  
CALIFORNIA CULTIVATOR, 115-117 N. Broadway, Los Angeles

## Can You Spare a Few Hours Each Week to Handle a Profitable Local Agency?

We need a representative in each county to put the Fruit Growers, Live Stock Men, Farmers, Dairymen and Poultrymen in touch with the money-making ideas, results of experiments and real farm and live stock information of value to be obtained from California Cultivator.

Only a small part of your time is needed each week to make money under our plan. We want to secure the services of men and women who can present a meritorious offer. You don't have to have previous experience. If you can do as well as others who had no more training than yourself, you can make splendid wages just for your spare time.

Our proposition interests every producer. There is an opportunity here for you—if this fits your case. If it does write to

## Harvesting Melilotus Indica for Hay

Written for California Cultivator by R. S. Vaile, University of California  
Citrus Experiment Station, Riverside

**M**ELILOTUS INDICA, commonly grown as a winter green manure crop, may be cut and cured for hay. It is rich in food value and when properly handled is entirely palatable to all kinds of livestock. Whether such a practice is wise in conjunction with Southern California orchards depends on many factors which the grower must weigh for himself. The following discussion is but an attempt to point out certain of the advantages as well as dangers which might attach to the practice. It is presented at this time because numerous inquiries have been received indicating a real interest.

If melilotus is to be used for hay it should be cut just before it starts to blossom. When allowed to stand longer it develops a bitter taste and becomes woody. As the lower part of the stalk is of low feeding value it is good practice to equip the mower with a high shoe so that a six-inch stubble may be left. This stubble will be of value to plow under.

One of the greatest difficulties in curing melilotus is that the harvest comes at a time of year when weather conditions are apt to be unfavorable for hay making, namely, late February or early March. The method of curing is very similar to that used for

alfalfa, but even greater care must be exercised because the leaves of the Melilotus are more apt to shatter. It is important that the leaves be saved as far as possible for they contain from two and one-half to three times as high a percentage of protein as do the stalks, as well as having very much less crude fiber.

If the crop is cut just before blossoming, leaving a six-inch stubble, a good stand should yield about a ton of hay per solid acre. When grown as an intercrop the yield per orchard acre will depend on the amount of land actually planted. This yield will not quite equal the tonnage that might be expected with barley. There is also greater danger of the crop being weedy in the case of Melilotus than in the case of barley.

On the other hand the feeding value of Melilotus is considerably higher than barley. Vorhees gives the following comparative figures in his book on "Forage Crops."

### GREEN FODDER

	Protein	Fiber
Barley .....	2.8	7.0
Melilotus .....	3.8	6.3

### DRY HAY

	Protein	Fiber
Timothy .....	6.3	29.3
Melilotus .....	14.1	27.3
Alfalfa .....	16.5	27.1

Feeding experiments conducted at several experiment stations indicate that Melilotus hay contains as much digestible protein as alfalfa and more than red clover. Feeding trials that have come to the writer's attention in Southern California indicate that Melilotus is a highly desirable feed, either as hay or silage, comparing favorably with alfalfa.

Judging by the work with cowpeas in the South and clover in Pennsylvania (similar crops because all are legumes) it would seem that the plowing under of the Melilotus stubble might be of some actual benefit to the orchard. In any event the damage following the removal of the hay as compared to clean culture through the winter would in all probability be negligible unless excessive drying out of the soil moisture was allowed to take place. This would not be the case in a normal season provided fall irrigation was practiced and the crop was harvested, as indicated, by early March. Barley left to mature for hay, on the other hand, would dry out the soil unless water were available for ample early spring irrigations.

Provided a ton of hay per acre was harvested, from 40 to 50 pounds of actual nitrogen would be removed. No

matter whether this nitrogen was taken by the plant from the soil or from the air, the practice of harvesting the hay as compared to plowing under the green manure crop would take about one-half pound of nitrogen per tree away from the grove. It would take 350 pounds of dried blood per acre to equal this amount of nitrogen. At present prices this dried blood (or commercial nitrogen in any other form) would cost very nearly \$15.00. Maybe the hay would be worth this much, maybe it would not.

Where orchard work is organized on a large scale so that the harvesting of hay would interfere with some other operation the practice would seem very questionable. On the other hand small unit orchardists might be able to utilize their teams to good advantage in this way for a few days previous to time of plowing. Hay enough to last some time could be harvested and the manure from it would ultimately be returned to the grove. The fact that part of the usual cash outlay would be avoided is another factor in favor of the practice. Certain it is from the standpoint of the orchardist that removing a Melilotus crop would be far better policy than removing a grain hay crop.

## Save Citrus Wastes

Three Bureaus of the U. S. D. A. Unite in Investigations and Laboratory Work  
and Fruits Which Formerly Went to the Washes Now May be Made Into  
Choicest Products for the Table or Into Chemicals for the Laboratory

**T**HE citrus industry is getting into a position where it is "saving even the squeal." Oranges and lemons are of all shapes, sizes and conditions, and while the greater percentage are attractive, there are many which may be of high quality yet still have certain defects which prevent them from going to market. For years these were dumped at the roadsides or in the "washes," or more lately a little return was received from them by putting them in the orchards for the small measure of fertility which they return to the soil.

From time immemorial the Italian orchardist has saved some of his product and his orchards have been the source of the citric acid of the world. As a rule the work of the small factory in occasional centers is the turning of lemons into citrate of lime, which later goes to the laboratory and is refined.

### Citrate of Lime

For many years systematic efforts were made in California to save some of these citric wastes. A factory was established at San Diego and citrate of lime manufactured and sent to Eastern laboratories. Marmalades, candied peel, dried peel, candied pulp and other products have been gradually improved upon until today there

Kumquat Orange  
Courtesy Teague Citrus Nurseries

are several factories in various Southern California points. The largest of these is at Corona and now another is being erected at the same place.

### A Laboratory

The bureau of chemistry of the department of agriculture has maintained a laboratory on Anderson Street, Los Angeles, for several years, in which chemists have been studying by-products and other problems. There is a factory conducted by the department, connected with the institution, and work has been carried on not merely to determine chemical questions but to perfect a commercial, practical process of handling these wastes.

This investigation and private work has continued until today the state is manufacturing refined citric acid, citrate of lime, orange vinegar—by the way one of the finest—, orange wine—though this is negligible—, evaporated orange, dried peel, candied peel, the dried citron of commerce, tincture of lemon peel, lemon oil, orange oil, and—the latest to be tried—fresh frozen orange pulp.

### Save the Orange

For years there has been experimental work in preserving this fresh orange pulp. Oranges have been peeled and the entire pulp reduced by vacu-

## Protect Your Crops

**Cultivator Publishing Co.**  
115 N. Broadway Los Angeles

um evaporator. It has been sterilized by heat, but always with unsatisfactory results; it had a "cooked" or other unsatisfactory flavor. Now the laboratories have tested and found satisfactory a process of freezing. The pulp and the juice are placed inside a receptacle, reduced to 14 degrees Fahrenheit, put in protected containers and sent by express directly to soda fountains, pie factories or other large consumers. Experimentally it has been found successful; the flavor remains perfect. It will be a problem of economical production to determine as to whether or not it will prove out commercially.

### The Peel

Evaporated orange has been very satisfactory. This is the pulp, rind and all reduced by simple evaporation. Sometimes to this has been added perhaps 20 per cent of sugar, but it has been found equally satisfactory to reduce to the dried state without sugar. This pulp is then packed in barrels and shipped to the larger Eastern centers.

The candied peel and dried peel have perhaps taken a greater percentage of the culls than any other one by-product. Production of citron, cured and ready for the consumer, has not proven successful. The process has been tried several times, but now we believe there is only one orchard in California, and that is about seven and a half acres near Riverside. A factory was established and the peel processed, but more recently contracts have been made with Eastern houses, and the rinds are sent direct to the market, the same as the citron of Italy, packed in brine.

### Specialists

Referring again to the by-products laboratory in Los Angeles. It is in charge of E. M. Chace, and beside the regular corps of helpers there are an assistant chemist, a junior chemist and a plant physiologist.

As this report indicates, there have been other questions than simply the chemical laboratory problems investigated from this laboratory. For instance during the last two shipping seasons the force has spent much time in the Imperial Valley, and in fact is now in the Turlock melon producing sections investigating both physical and chemical conditions of cantaloupes. This year some most valuable lessons have been learned. This work of the bureau of chemistry has been carried on in connection with the bureau of markets and the bureau of plant industry of the department of agriculture. These three bureaus have worked together for some years on these shipping problems.

This year in the melon fields ventilating has been one of the principal subjects of investigations. Fruit in various stages of ripeness has been picked, some shipped and some kept in refrigerator cars on the siding in Brawley as nearly as possible under the same conditions as the fruit which was going to market. And here, as with the orange shipping problem of some years ago, the necessity of careful handling has been the principal lesson learned. That is the most difficult of all problems, that is, where a dozen trainloads of melons are to be picked, hauled, packed, loaded and refrigerated within every 24 hours the number of helpers required is very great. At best much of this help is indifferent. The fully ripe melon handled by experts of the department has been found to keep and to reach the market in best of condition. Either ripe or comparatively green

melons reach the market in bad condition so often as to show that there is a great lack of careful work.

This passes the problem on to the grower and the packer, but it must be solved.

As noted, part of the force is now in the Turlock melon fields making investigations there. Later, investigations will take up grapefruit, Bartlett pears and dates. The period at which dates should be harvested is a comparatively new question. Another problem is that of the avocado growers. Growers do not understand the

proper time to pick an avocado to have it at its best. Mr. Chace remarked that he had seen avocados in the market in Los Angeles which should not have been removed from the trees for months, yet offered as salable fruit. These are not all of the questions considered; new ones are coming up daily which will offer plenty of field for investigation by experts.

Under the direction of Mr. Chace is also a small laboratory, formerly maintained at Tampa. This will probably be removed to Gainesville and be conducted in connection with the experiment station of Florida.

## Pruning as Practiced in the Natomas Olive Grove

By Edward K. Carnes in Olive Journal

**P**RUNING is a matter of judgment, not a rule.

Pruning is as natural and as old as any other orchard operation. Nature has always adopted this method for reducing the exceedingly large number of buds and small sprouts from growing into large branches and thereby overtaxing the energies of the tree. She prunes regularly and at the right time, leaving no large and ugly scars. Good pruning should follow this rule of nature.

It would be folly to even attempt to give definite instructions about how to prune olive trees; since there are no two trees that are exactly alike. No two trees can be pruned alike if they are properly pruned. Pruning is a matter of judgment, not a rule; some individual judgment has shown marked results over the system practiced by the majority of our growers, which result may have been influenced by locality, soil conditions, culture or climate.

When the tree is planted every side branch is removed till the tree is like a buggy whip; it is headed back to 18 inches, the top painted and tree protector put on. We never cut a single leaf or branch from it that grows the first year.

When a year old (spring), having been headed low, three to five limbs only are allowed to form the scaffold, all limbs cut as near the trunk as possible so the wound may heal over quickly. The healing of the wound depends on the activity of the cambium layer; this layer is most active in the spring after the tree starts to growing. Prune shortly before the growth starts.

We distribute the scaffold branches around the trunk, also up and down (not opposite), so when we finish, looking down at the trees the remaining limbs resemble the spokes in a wagon wheel.

Next season shorten it, round up

and shape the tree and remove cross limbs. We figure the pruning a tree secures during its first few years determines the shape of its future head and reduces the necessity of future heavy pruning. Most of the unruly or wild limbs are removed on the young trees before they become a nuisance or have robbed the tree. We conserve the tree's strength for good limbs. We find if intelligent training is given the young tree it does not need "pruning" later on; only "trimming" after it comes in bearing.

### Fruit Wood, Water Sprouts and Two-Year-Old Wood

Can you go up to an olive tree and pick out from a bunch of "shoots" the ones that will bear fruit; these that will outgrow their neighbor by three times and finally be a "sappy" branch, that will never produce good fruit if any? Can you tell wood that is two years old, that has borne fruit?

We figure that an olive only produces fruit on two-year-old wood, once and once only.

Can you pick out the fruit wood limbs that will grow upward in a drooping curve? Can you tell a "water sprout" olive branch? Can you detect limb rubs and cross-limbs? Can you remove a limb and not leave a stub? Do you figure an olive tree produces the best fruit on long or short limbs? If necessary to remove a limb, would you "stub" it off, or go back to its origin from the trunk? Can you "balance" a tree top in pruning?

These are some of the questions we ask a "pruner" before we turn him loose in our orchards, and if he can't answer them correctly and is "just a tree pruner," we put him with a man who has been taught our system for a week and then watch him carefully.

By marking certain limbs that are "different," we believe after four years of watching their performance we can tell the things set forth in our questions.

## Investigating Markets

Written for California Cultivator

**O**NE of the most useful activities of the department of agriculture, which is closest to the people, is that of the bureau of markets. It is one of the newer bureaus of the department, but its work has saved millions for the producers of the country. The Southern California branch of the bureau has its office in the Federal Building in Los Angeles. It is in charge of A. W. McKay. His assistants are V. W. Ridley and C. P. Schuster, and they are assisted in fruit handling field work by G. L. Fischer

and A. V. Stubenrauch, Jr., and Special Investigator in Fruit Storage, C. W. Mann.

These men are investigating field conditions, storage conditions, and especially conditions in the interior of the car while in transit, taking day by day temperatures. These temperatures, by the way, are taken in various parts of the car in a most unique way.

Thermometers are arranged, one at the bottom of the car near the bunkers, one at the door, and one midway—these all at the floor. At the top of the car are three others similarly

located. Through these electric connection is had with the outside. The investigator comes with his reading instruments and reads reports of temperature conditions in various parts of the car over these wires. Report is filed, and later at the office a chart is constructed showing temperatures from these six thermometers.

Every day or, if desired, every hour of the day, from the time the car leaves California until it is unpacked in New York or other markets, a record may be had of these cars. These charts are more than interesting. Of course the thermometers at the bunkers and at the floor show the lowest

temperatures. The temperature rises toward the center of the car and is always very much higher at the top of the fruit. The variation in temperature is sometimes as great as 10 degrees between thermometer at bunker at the floor and in the center at top of the fruit.

An effort is made to equalize these temperatures as much as possible, but since the railroads have required heavier loads it has been necessary to put in an additional row of fruit through the car, and this has left almost no air circulation space in the alleyways and has complicated the problem.

## Tulare County Lemon and Grapefruit Association

In the Porterville Messenger of July 2 we note:

"Organization has been completed of the Tulare County Lemon and Grapefruit Association with the receipt of the association charter from the state officials. The newly elected officers are:

"W. E. Sprott of Porterville, president; A. W. Swain of Strathmore, vice-president; W. S. Shippey, secretary, treasurer and manager. Directors are W. E. Sprott, A. W. Swain, V. A. Parr of Tulare; H. L. Matzke of Plano; B. L. Morey of Strathmore; J. Althouse of Plano; E. R. Abadie of Deer Creek.

"On recommendation from Manager Shippey the directors approved of a purchase of a site for a new packing house to be located at the junction of the Santa Fe and Porterville North-eastern railroads, giving the new asso-

ciation trackage over the two lines. Plans for the building have been roughly approved and it is proposed to begin work on the construction of the building without delay. The contract for the building will be conditioned upon its completion in time to handle the output of the coming season.

"This building will be 80x100 feet in size, will be built of hollow tile and will embody the very latest ideas of this type of construction to allow for the rapid and economical handling of fruits.

"Offices of this company, with the Sunland and Plano associations, of which Mr. Shippey is also the manager will be consolidated for the purpose of saving overhead costs. Quarters for the organizations have been secured in the Thomas building and will be opened there in due course."

## A Bigger Yield From the Same Field.

From any field that you have been manuring by the hand method you can get a bigger yield if you use the spreader method—and save much time and labor.

A good spreader tears up the manure into small particles and spreads it evenly. The manure goes farther. It can be worked well into the seed bed so that the plant roots get all of its valuable plant food. *Wasting manure is like wasting money—a good spreader makes every particle of manure count.* A Newton County, Ind., farmer testing the spreader and hand methods of applying manure on two ten-acre tracts found that the spreader method gave 120 more bushels of corn, 140 more bushels of oats and 9 more tons of clover.

## The John Deere Spreader

The Spreader with the Beater On the Axle

has special capabilities for increasing your crop yields. Its exclusive features make it the ideal implement for the best method. Ask any owner of the John Deere Spreader about the way it increases crop yields and saves time and labor. After you have operated a John Deere Spreader of your own for a year, you will fully appreciate how much these gains really mean. You'll find that the Spreader with the Beater on the Axle more than pays for itself in one year from the gains it gets on even a fair-sized farm.

The beater on the axle construction eliminates all chains, clutches and scores of other trouble-making parts. Does away with half the types of castings otherwise necessary. Does away with adjustments. Puts upkeep at minimum. Makes the John Deere Spreader exceptionally long-lived.

Beater is all steel—practically indestructible—runs on roller bearings, aiding light

draft. Beater teeth spirally arranged—tear up manure perfectly and distribute it evenly. Deliver manure close to the ground—wind does not affect spreading.

Revolving rake feeds manure to beater evenly, aiding in uniform distribution.

Shock-absorbing spring relieves spreader and horses of sudden strains.

Spreader only hip-high to top—easy to load. Big drive wheels—light draft. Ball-bearing apron drive—apron travel frictionless. Simple

gear attachment keeps weight of load from making apron race when spreading up hill.

Easy to operate—only two levers—one lever determines number of loads spread to the acre; the other starts and stops the spreading. It's so simple, a boy can operate it.

Wide-spread attachment for extra wide spreading.

Write for booklet on the John Deere Spreader.

## A Special Plow for California Orchards

Plowing conditions in California orchards demand special plow construction. A serviceable plow must stand the severe strains occasioned by the soil conditions and operate close to the orchard trees.

### John Deere California Orchard Tractor Disc Plow

meets these conditions admirably. Heavy lap-beam frame—laps securely joined by heavy bolts—no sagging—discs always in alignment.

Discs best quality steel—disc bearings oil-tight and dust-proof—scrappers made to stand severest strain.

Double setting of discs permits use in very hard, dry ground as well as in loose, trashy soil.

Special "Z" land axle brings land wheel parallel with rear disc beam, permitting plowing close to trees.

Special adjustment on front furrow wheel, causing it to set inside line of front discs so that plow

will work close to trees when soil is being thrown to them. Beam has special shape to permit working close to trees.

Write for free booklet on this plow.

## Big Book Free

### Better Farm Implements and How to Use Them

America must produce more food. Labor-saving implements will play an important part in increased crop production.

This book tells all about a full line of labor-saving farming implements. Tells how to

adjust and operate many of them. A practical farm implement encyclopedia. Worth dollars. Illustrates and describes the following machines: Walking and Riding Plows, Tractor Plows, Disc Plows, Disc Harrows, Spring Tooth and Spike Tooth Harrows, Corn and Cotton Planters and Drills, Listers, Alfalfa and Beet Tools, Grain Drills and Seeders, Riding and Walking Cultivators, Lister Cultivators, Mowers, Side Rakes, Loaders, Sweep Rakes and Stackers, Hay Presses, Grain and Corn Binders, Corn Cutters, Stalk Cutters, Kaffir Headers, Manure Spreaders, Portable and Inside Cup Elevators, Corn Shellers, Wagons, Farm Trucks and Buggies. This big book will be sent FREE if you state the implements in which you are interested and ask for Package X-1110.

### Uniformity in Implement Manufacture

means much to you. You want to feel safe that every implement you buy is up to standard. Getting implements whose quality and workmanship is up to standard is a matter for your serious consideration.

Specialization—different factories for different classes of tools, each directed by specialists pre-eminent in their particular line—control of all the processes in the manufacture of implements from the leading raw material used to the finished product; and rigid adherence to exact duplication of trial implements whose qualities have been fully tested in actual field work, all combine to make John Deere implements uniform in quality and design.

**JOHN DEERE, MOLINE, ILLINOIS**

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

Man Size

One alfalfa root and its products. Fred Shaffer, secretary Yolo County Board of Trade, is trying to reach it. The weight of the single plant is 21 pounds, the root is two inches in diameter, it stands over eight feet high. Ask Yolo County about it at the coming state fair. Shaffer will be there.

## Standardization

COMMISSIONER COLLINS of Tulare County calls attention of the fruit shippers to the provisions of the new standardization law, the enforcement of which rests upon the county commissioner. Regarding the new law Mr. Collins writes:

"The Balling test for the early grapes remains the same—17 per cent while the Emperors, Gros Colman and Cornichon must test 16 per cent Balling scale.

"The most important change affecting growers and shippers of deciduous fruits is the one requiring local as well as interstate shipments of all packed fruits to comply with all requirements of the law. This will necessitate the dumping or working into by-products of all fruit rejected at the packing sheds. All growers should note this and use due diligence in picking their fruit and thereby save

the inspector the disagreeable duty of rejecting their fruit, and themselves the loss of it, as this clause will be rigidly enforced. Fruit shipped to the local markets may be inspected and rejected at the destination if, from accident or design, the shipment does not comply with this law.

"The strict observance of this law will work no hardship on any one but will eliminate fraud and deception.

"The law governing the standardization of fresh fruits although it has been in operation but two years, and in a crude form at that, has done more than any other one thing toward putting that industry on a sound financial basis.

"There are many minor improvements in the new law and we cordially solicit the hearty cooperation of the growers and packers alike in our efforts to secure the best results from these changes."

## Tractor Men Meet

PHOTOGRAPHED below is a live wire bunch of Southern California Tractor and Implement people planning for the demonstration to be pulled off September 18-22, just without the limits of Los Angeles. It will be noted that the banquet table is in the form of a great letter T, which shows the importance placed upon the tract-

or by the organization. They feel that patriotic America demands tractors put into the hands of farmers, which shall be efficient and economical.

This organization has been in existence for a couple of years and offer-

Traction Engine & Implement Dealers' Association of Southern California banquets at the Alexandria, Los Angeles, and prepares for the big demonstration September 18-22. Standing at the rear the tall man, in light gray suit, near center in front of flag, is President O. H. Stevens; at his right is Secretary W. L. Cleveland; at his left Mr. Rosewater.

ed the greatest tractor demonstration yet held west of the Rockies, at Puente last season. A still greater is now planned, and almost everything which will be of interest to producers of California and Arizona will not only be exhibited but there will be demonstrations in action.

It was deemed fitting that the "father of tractor demonstrations" should give the 1917 demonstration an initial push-off, so Chas. C. Rosewater, founder of the Twentieth Century Farmer of Omaha, Nebraska, in 1913, was the principal speaker of the evening. Mr. Rosewater gave an account of the corn exposition held in Omaha, which practically led up to the tractor demonstrations. At this first demonstration 27 concerns made various exhibits. One of the exhibits was the original Ford tractor for which the public still waits. As Mr. Rosewater says, perhaps the greatest lesson of this first demonstration was the showing to the makers of tractors not only some of the good points of their own and their competitors' machines, but also some of the weaker points. Several hundred acres were provided and actual field work was engaged in, with implements attached.

Today with tractors more nearly reaching standardization, the tractor demonstration is useful more as an educational feature to the producers

than to the manufacturers. Mr. Rosewater said "You must tractorize every territory." The tractor is today accepted in a general way by nearly every farmer, but it has not yet become a living, producing thing on his ranch because of his lack of knowledge of its full capacities. This demonstration should be an education to the farmers who attend. It must be burned in that the tractor not only saves horsepower, but man power, time and money, and it conserves moisture.

## Export License Required on These Articles

Because of war necessity none of the articles listed below are permitted export without license. This list was authorized on July 23:

Coal.

Coke.

Fuel oils: Lubricating oil, benzol, head lantern oil, toluol, naphtha, benzine, red oil.

Kerosene and gasoline including bunkers.

Food grains, flour and meal therefrom: Corn flour, barley, rice flour, rice, oatmeal and rolled oats.

Fodder and feeds: oil cakes and oil-cake meal, malt, peanuts.

Meats and fats: poultry, cottonseed oil, corn oil, copra, cocoanuts, desiccated, butter, fish, dried, canned

The tractors now offered on the market are good, that is, their manufacturers have learned the best lines upon which they should be built. There are still improvements which can be made, and they are being made every day.

President Smith of San Francisco, representing the California Tractor Men's Association, offered the goodwill of that association and assured the Southern California association that they would work together in advancing tractor interests.

or fresh, grease, inedible or edible of animal or vegetable origin, linseed oil, lard, meats, all varieties, tinned milk, peanut oil and butter, rapeseed oil, tallow, tallow candles, stearic acid.

Pig iron.

Steel billets: steel sheet bars, steel blooms, steel slabs.

Ship plates and structural shapes: iron plates, "I" beams, mild steel plates, rolled steel plates, steel channels, steel angles, mild steel plates, ordinary tank quality, steel beams, steel plates, 1/2 of inch thick or heavier; steel sheets, 1/2 inch thick or heavier are classified as steel plates, steel tees and zees, structural steel shapes, boiler plates, tank plates, steel doors, steel car frames, steel towers.

Scrap iron and scrap steel.

Ferromanganese.

Fertilizers: cattle manure, shredded, nitrate of soda, poudrette, potato manure, potassium salts, land plaster, potash, cyanamide, phosphoric acid, phosphate rock, superphosphate, chlorate potash, bone meal, bone flour, ground bone, dried blood, ammonia and ammonia salts, acid phosphate, guano, humus, hardwood ashes, soot, sheep manure, pulverized, anhydrous ammonia.

Arms, ammunition, and explosives: nitrate of potash, rosín, sulphur, salt-petre, turpentine.

## Deciduous Tree Gumming

GEORGE QUINN, horticultural instructor of the South Australian government, discusses the matter which is of concern to every deciduous fruit grower in a recent issue of the Fruit World of Australasia. He says

"Gum is simply sap which has been exposed and congealed or changed by contact with external agencies. Frequently, however, the change is made in stone fruits through the agency of fungi which have gained an entrance by wounds of a greater or lesser extent, or even by means of the buds, which are less able to resist than the more solid bark. The exudation from wounds made by pruning is increased when the pruning is performed at a time when the sap is still slightly liquid, but not actively flowing, as it is when the tree is making or sustaining foliage. One cannot say that early, medium or late pruning after the leaves have fallen will give rise to it in any given season, for the simple reason that in our climate the solidifying of the sap is scarcely completed some years before it begins to liquify again. In cold, dry winters the tree either goes more completely to rest, and the solidification of the sap is more complete, or the closing up of

the channels at the cuts is more rapidly attained by natural processes of cauterization (drying).

"In a year like the present the peeled-off bark, especially on young trees, even at midwinter reveals a moisture to the touch in the sap layers and when the weather is consistently wet, so that the cut ends do not dry up. This sap is bound to exude and congeal into gum. Unless wound fungi find a lodgment on these cut ends the gum will solidify as soon as the weather turns dry and form a sort of natural plaster.

"In respect to artificial dressings to prevent injury, grafting waxes will not, as a rule, adhere to moist surfaces. The best suggestion I can make is to spray or paint the cuts with a strong fungicide, such as Bordeaux mixture. This will disinfect the wounds and keep out decay-producing organisms until the healing tissue is drawn over the wounds by the action of the tree's growth. I may say in a general sense I believe the very prevalent decline of our apricot trees will be found to have been hastened by the heavy prunings of winter having made bad wounds, which have admitted decay into the fibrous tissues of the limbs and trunks

of the trees, thus lowering their vitality, although externally there is little evidence to this effect at the time. When a severe strain, such as the protracted drouth of recent years has imposed upon the trees' powers, this lowered vitality must prove an important factor in deciding whether they shall live or die.

"I believe, if it is possible to initiate a system whereby the making of these large wounds can be avoided, and the energies of the tree in building up its permanent structure be

directed into the desired channels during the growing season, much will be achieved toward increasing the tree's chances of sustaining a long life. As an indication of the practical application of this theory I suggest several summer manipulations in the form of disbudding surplus shoots, even to complete suppression, whilst others more suitably placed have their terminal points pinched out to cause them to subdivide into growths needed for framing the tree or maintaining a supply of fruit-bearing shoots."

## Watermelon Syrup

A delicious table syrup can be made from watermelon and affords a convenient means of using the surplus watermelons which otherwise are allowed to spoil in the field. This syrup can be used immediately or can be bottled hot in sterilized jars and kept just as is done in the canning of fruit. It is reddish brown in color, very sweet and well flavored and will serve most of the purposes for which syrup is used in the home. Directions for making are given by The Fruit Grower of St. Joseph, Missouri.

### Directions

Remove the pink flesh and seeds from the rind of sweet, fully ripe melons. Crush the flesh with a potato masher or by running it through a meat chopper. Place the crushed pulp and seed in cloth bags and squeeze out the juice, which flows out readily. About five-sixths of the pulp will squeeze out as juice. About 13 gallons of the juice will make one gallon of syrup. This amount of juice can ordinarily be secured from ten watermelons weighing from 22 to 25 pounds each.

The juice is then boiled down into syrup in an ordinary preserving kettle. The juice boils without much foaming until it begins to thicken, when the fire should be slackened to prevent foaming and burning. The red coloring matter in the juice coagulates during boiling and part of it

rises to the surface, where it can be removed by skimming. The remainder floats about in the juice forming red particles which gather near the top. Toward the last of the boiling the syrup must be watched constantly. If the housewife has a candy thermometer she should take the syrup from the fire as soon as it reaches a temperature of 220 degrees Fahrenheit, otherwise she should let it cook until a small sample on cooling is about as thick as maple syrup.

When the boiling has finished the syrup can be set aside to cool in covered vessels or can be poured while hot into cans or glass containers and sealed.

Where a cider press is available the melons can be cut into pieces and arranged on the press so that the pressure will extract the juice of the pulp before it presses the rind. The juice of the rind is not so rich in sugar, and experiments with rind juice alone indicate that it is not suitable for syrup.

### To Remove Red Coloring Matter

If it is desired to make syrup free from red particles, start the syrup boiling, and when some of the coagulated matter has been removed by skimming, transfer the juice to tall glass jars or other tall containers and allow it to settle and cool for a few hours. This allows the red particles to settle to the bottom. The upper part of the juice can then be poured off and boiled into syrup.

## War on Pine Beetles

War has been declared upon the beetles that annually destroy sugar and yellow pine timber to the value of hundreds of thousands of dollars in the forests of California. The forest service, the park service, the large lumber companies, and timber owners (representing holdings amounting to 16,000,000,000 board feet), have placed survey parties along the Sierras from Eldorado County to the Tehachapi to find out actual extent of the damage and plan a campaign that will control this enemy of the forest.

It is the habit of these insects to attack a healthy pine or fir, bore rapidly through the dry bark to the cambium layer, the vital tissue between the wood and the bark, and here drill their galleries in which the eggs are laid and the larvae hatched. The larvae mature into beetles and eat their way out to the surface, fly to a new tree and commence the vicious cycle over again. California's pine forests have been subject to attack since time immemorial.

The beetles have their natural enemies. Other species of insects wait at the mouth of the exit holes and when the new hatched beetles emerge, pounce upon and devour them. Woodpeckers and other birds take their toll. The attacked tree also puts up a stubborn fight. As the beetle bores

into the wood, it is met with a great flood of pitch exuded by the tree in an attempt to drown its enemy. Sometimes the pitch flow will down the entire colony. Of late years, however, woodsmen have come to believe that the ravages of these insects are on the increase. The government and the timber owners have declared a war to the knife.

### PEAR GROWERS, ORGANIZATION

Pear Growers of Napa County recently met and discussed the advisability of organization to secure more satisfactory returns in the market on both fresh and dried pears. E. B. Anderson of Contra Costa County spoke of the methods of work of the cooperative organization of that county. After discussing the question from all sides the following was adopted:

"Whereas, it is the general opinion at this meeting that a permanent organization should be effected in the County of Napa, in conjunction with the other counties of California, to promote the general welfare of the green and dried pear industry.

"Resolved, that such organization be effected, and that the pear growers of this county obtain for their green fruit, f.o.b. cars, not less than \$55 per ton this season."

### GLENN COUNTY FARM BUREAU

Meetings will be held during August as follows: 6 and 7 Ord, night meeting 7; 9 and 10 Larkin, night meeting 10; 13 and 14 Codora, night meeting Tuesday 14; 16 and 17 Jacinto, night meeting Friday 17; 20 and 21 Orland, night meeting Tuesday 21; 23 and 24 Plaza, night meeting Friday 24; 27 and 28 Elk Creek, night meeting Monday 27. Regular directors' meeting, Willows, 10 a. m., Saturday, August 4.

Mr. Essig, of the division of entomology, University of California, will be in the county during the month conferring on the subject of crop pests.

The farm adviser has been appointed county director for the United States Boy's Working Reserve. Enrollment by boys between the ages of 16 and 21 can be made with the county director.—W. H. Heileman, farm adviser.

### SECRETARY OF THE CHAMBER

H. S. Maddox, who has been secretary of the state horticultural commission since Commissioner Hecke has been in charge, has tendered his resignation and accepted the secretaryship of the new Consolidated Chamber of Commerce of Sacramento. Mr. Maddox was formerly secretary of the Yolo County Chamber of Commerce and has been a Sacramento Valley booster at the exposition and in every possible position. His election to the Sacramento chamber was unanimous.

"I cannot commend the work of Mr. Maddox too highly," said Commissioner Hecke, "and would prefer, of course, to have had him remain with me. I realize, however, that his nature leans toward more thorough action—a broader field—and Sacramento and her business interests need the touch of virility he can lend."

### NEW MANAGER FOR LIMA BEAN GROWERS

R. L. Churchill has taken over the management of the California Lima Bean Growers' Association from F. A. Shipley who recently resigned.

Recent annual election resulted in election of C. C. Perkins, president; R. G. Edwards, vice-president; W. H. Stiles, secretary; and W. S. Saviers, treasurer. Board of directors, re-elected, are: B. F. Barr, T. A. Rice, Richard Bard, John Lagomarsino, M. H. Butcher, E. S. Stowe, W. C. Jerome and George W. Moore.

### SWEET CLOVER

"Sweet Clover; Growing the Crop," Farmers' Bulletin 797, by H. S. Coe, published by the United States department of agriculture, Washington, D. C., is being distributed. Write the department at the above address.

### DOWNEY FAIR

Wm. Booth, chairman of the exhibit committee of the Downey Community Fair, informs us that Saturday of this week in the high school grounds at Downey will be pulled off a real live wire fair. It is featured for the purpose of aiding the Red Cross and also to show up an exhibit of agricultural products of that section of Los Angeles County. This is the second fair of the kind. It is hoped by another year live stock may become a feature of this fair.

### SHORT COURSES

The university farm at Davis is making preparation for short courses which will be given at the farm September 24 to November 2. Dean Van Norman writes: "Practical ranchers who have attended these courses say that the money spent for board and room has been repaid many times over in what they have learned from the farm staff, in the fields, flocks, and orchards of the farm, and from ranchers with whom they they have spent many hours of contact.

"Many young men fail to go to the short courses merely because they don't know of the opportunity. We are glad to tell them, and doubtless you will be glad to pass the word along. If you don't know about these short courses send to University Farm School at Davis for the short course booklet; it alone is well worth the bother of writing such a letter.

The department of engineering of the state of California is issuing Bulletin No. 3, "Investigations of the Economical Duty of Water for Alfalfa in Sacramento Valley, 1910-1915." It is a valuable publication based on data gathered under cooperative agreement between the office of public roads and rural engineering of the United States Department of Agriculture, the California State Department of Engineering and the University of California Agricultural Experiment Station, and reprinted from the Fifth Biennial Report of the Department of Engineering.

The Santa Paula Lima Bean Growers' Association at its recent annual meeting elected the following officers: President, W. H. Fleet; vice president, H. P. Balcom; secretary-treasurer, A. F. Walden, director and representative on central board, M. H. Butcher. The other directors are L. E. Mills, R. C. Joy, Erret Norman and A. G. Waters.

Wheeler's Hot Springs offers to the pleasure, rest and health seekers one of the most attractive mountain resorts. The good auto roads and hotel and camp accommodations are complete. Make reservations now. Free circular.

**Wheeler's Hot Springs, Ventura Co., Cal.**

# Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

## Evaporating Apples

Please give information in the Cultivator as to best method of evaporating apples. — Subscriber, Redwood City.

Sun-drying of apples is followed in the dryer, warmer valleys. They are dried much the same as other fruits but care must be used to sulphur soon after cutting. If this is not attended to the apples darken and a less attractive product is secured.

## Nests

Will you please give me a description of a nest that the hens will not scratch all the straw out of. I have deep nests and it would seem impossible for them to get the straw out but I will put in nice clean straw while they are eating their breakfast and go out in an hour and there will be none left. They practically have to lay on the bare boards. — Subscriber, Glendora.

Why not try trapnests? If you will send a postal card to Agricultural Experiment Station, University of California, Berkeley, California, asking for Circular 142, you will find in this circular complete description and diagrams of California trapnests. Nos. 1 and 2, both simple designs easily made at home. No hen could scratch the litter out of one of them, for she is shut in as soon as she enters and must stay ill she is let out. If you do not care for the trapnest, try the bottomless nest, which is merely a deep box or series of boxes without a bottom, set on the scratching litter on the floor of the house. This nest may be entered from the end or from the top. In the latter case the box will have to be made long enough to permit the hen to jump down in the nest beside the eggs, not on them. The use of something other than straw for nesting material might help to break the hens of their annoying habit. Sawdust is very good for this purpose and mites do not breed in it as they do in straw. Clean sand makes a good nest, and dry leaves are not as readily scratched out of the nest as straw.

## Starving for Molt

Would like information regarding starving hens through the molt, a practice quite prevalent some years ago.—Subscriber, Arroyo Grande.

The starving plan has been almost entirely discontinued. Mrs. Koethen's "Poultry for Profit" says: "The practice of starving the hens in order to force an early molt is condemned by nearly all experiment stations. After experiments with White Leghorns covering several seasons the Cornell station declared that there was nothing whatever to be gained by forcing the molt." Of course overfat hens should have a somewhat reducing ration at this time of year.

## Apricots Rotting

Please advise what causes apricots to rot on the trees. Have two four-year-old Royal apricots, which have been pruned, sprayed and thinned. Both set a good crop of fine large fruit but the fruit is now splitting at the end and rotting on the tree, some even rotting without splitting.—Subscriber, Ontario.

This seems to be a new trouble and has not only appeared in the Ontario section but is probably the same trouble which is affecting apricot orchards

of Madera County. At first the trouble in that section was thought by the horticultural commissioner to be due to insects. However, we wrote him regarding it and have the following: "In reply to your inquiry with reference to damage to apricots by beetles, after further investigation I have concluded that the origin of the trouble is a soil moisture or climatic condition which causes the fruit to crack on the end just about the time it is commencing to get ripe and while still very firm and often a little green. My first observations led me to believe that the trouble was caused by a little snout beetle; I afterward found other beetles. These beetles, no doubt, entered the fruit after the opening became larger so that the pit was visible, and because of the air conditions or work of beetles fermentation took place and there was considerable loss on some varieties."

It is possible the trouble is due to abnormal weather conditions, which may not occur again for years.

## Dipping Prunes

Please give formula for lye dip for dipping prunes before drying.—Subscriber, Los Angeles.

The strength of the lye solution depends on the ripeness or condition of the fruit and degree of heat. If the prunes are fully ripe or partially dried and the water is not boiling some use as strong a solution as one pound of lye to ten gallons of water. When care is used to keep the water at boiling it may be used as weak as one pound to 50 gallons.

## Summer Blight of Tomatoes

I have several acres in tomatoes which were irrigated on alternate sides every seven or eight days while they were young, since then irrigated as needed, and always kept thoroughly cultivated. Now and then a vine looks lighter in color, later begins to wilt and finally dies. We can find nothing wrong with soil conditions. Is this blight and is there a preventive or cure?—Subscriber, Hemet.

This is probably summer blight, one of the worst diseases of the tomato field. The bacteria may have been present in the soil at planting time or may have been introduced with the plants. Their action is largely upon the inner tissue or roots and affects them so that they are unable to take up moisture or nourishment and the plant dies of starvation. There is no cure for affected plants. The only treatment is preventive. Care should be taken in making the seed-bed to use new clean soil, free of any fungous or bacterial trouble, then set plants in ground known to be free from the disease.

## Insects Infesting Dried Fruit

Please advise how to prevent insects getting into stored dried fruit.—Subscriber, National City.

The best way is to take the fruit in at noon-day when the heat of the sun has killed all forms of life. Then if the fruit is not over-dried and it is kept in the sweat bin entirely free from insects it should be all right to pack away. However, if one wishes to be sure or if eggs have been deposited on the fruit, then before packing away it may be placed in wire baskets and dipped in vats of boiling water. After the dipping place in a dark or insect tight room for the surplus water to drain off. In 24 hours it will be ready for packing in boxes or tight containers.

# Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

## Poor Shipment of Potato Plants

I contracted for shipment of sweet potato plants, making part payment and stating that I would remit balance on safe arrival of plants in good condition. Plants arrived packed in huge packing case C. O. D. without permission of inspection. Upon opening case I found plants in heated condition and 1500 short, for which shortage I have made claim, which has been ignored. My check had been cashed prior to shipment, otherwise I would have refused delivery. Have I any legal claim?—Subscriber

Certain warranties are implied in every sale of personal property even though not mentioned in the contract. One is that a person who sells merchandise inaccessible to the examination of the buyer thereby warrants that it is sound and merchantable. The buyer has a right to inspect the thing sold at a reasonable time before accepting it and may rescind the contract if the seller refuses to permit him to do so. One who sells personal property must put it into a condition fit for delivery and, in case he agrees to deliver it to the buyer, must use ordinary care in forwarding it. You, of course, have a claim for the shortage, and, in case you can prove that the seller did not use ordinary care in shipping, you can hold him for any damage to the shipment caused by overheating. You would have been entirely justified in refusing acceptance when you were refused right of inspection and could have recovered your prepayment. Now, that you have taken the plants your safest procedure would be the action for damages.

## THE ANT NUISANCE

Written for California Cultivator

**A**NTS never seemed to be as pestiferous as this year. They come, and after they seem to be all killed off they continue to come. Buhach drives them away, poisons likewise, but the army is renewed. The only way to handle them seems to be to use every possible means, and persistently. As we have said, fresh buhach scattered almost daily is ordinarily effective. This is more in the nature of a repellent, however, than otherwise. Mr. A. E. Magoffin of Los Angeles County, has a "for-sure" remedy. It has been referred to before, but it is effective and well worth repeating. Mr. Magoffin writes: "I note in the Cultivator of April 14 someone asked how to get rid of ants, and I submit the following: Having served behind a drug counter for 52½ years, I speak from experience. Some years ago we were troubled greatly with ants, big and little. I located their holes near the house (for the house was overrun by them) and about sunset, when the ants had retired, I poured a few teaspoons of bisulphide of carbon in each hole and covered holes with a piece of sod. As the bisulphide is poisonous and the vapor is heavy, the vapor falls instead of rising. It goes down in the holes and destroys the ants. As gophers out here are numerous, I am using same treatment and so far am successful."

In addition here is a remedy recommended by J. B. Neff and given in our columns of October 7, 1916:

"Three tablespoons of honey, tartar emetic the size of a lima bean. Mix and put in two or three saucers and place where ants are proving troublesome."

And when these remedies have all been used, perhaps the commercial remedies such as ant paste, etc., may well be brought into requisition. They are effective if their use is persisted in. We may say that the ant paste proposition will work in the paper sack plan suggested in the issue of July 21, 1917.

## NORWALK TIRES

Norwalk Tires embody those lasting qualities which make for utter satisfaction. They give thousands of miles of perfect service without appreciable wear. Guaranteed 6000 to 7500 miles. The ideal country tire. Ask for folder.

## The Two Spotted Red Spider in Cotton

By A. W. Morrill, State Entomologist of Arizona

ONE of the most widely distributed plant pests is the two spotted red spider. It probably occurs in every state in this country, having been definitely reported so far from 37 states. It attacks many greenhouse plants and consequently has an unusually favorable opportunity to be transported from one section to another.

This pest has been mentioned in reports of the Arizona state entomologist as infesting violets and strawberries in the Salt River Valley, but it has never before been known to be as abundant in this section as it is this season. It has been especially destructive to garden beans, to the foliage of the Dorothy Perkins rose and the blackberry. Among the other important food plants are cotton, alfalfa and tomato. A recent government bulletin records a total of 183 food plants observed in the cotton belt of the Southeast.

There is only one record of injury by this red spider to alfalfa. This was reported from Cochise, Arizona, a few weeks ago. This pest has done its greatest damage to cotton in the Eastern states where it has been estimated that the injury in some years amounts to \$2,000,000. It has not so far been found on cotton in Arizona, but it is practically certain that it will appear in cotton fields sooner or later, and it is important that cotton growers whose fields become infested discover the pest before it has an opportunity to seriously damage the crop.

The eggs are minute globular objects found on the under surfaces of the leaves. The young in the first stage have three pairs of legs, while in other stages there are four pairs of legs. This red spider is very variable in color; shades of green, yellow and red being common. The most typical coloration is brick red with two dark spots on each side of the body. The full grown females are less than a fifteenth of an inch in length and the males are much smaller than the females.

The leaves of infested plants turn ashy green in color as a rule but cotton leaves become rusty red and brown. Sometimes infested plants are more or less covered with a delicate web which is spun by the mites under certain conditions. The lower leaves of cotton plants are first infested and the mites spread upward as they increase in numbers.

It is believed that these mites do not pass the winter on cotton or in cotton fields, except in certain cases on wild food plants. In the cotton growing sections of Arizona the two spotted red spider is likely to pass the winter on strawberry plants, violets or other low growing food plants. Alfalfa fields should furnish favorable conditions for the overwintering of the red spider, but so far this crop has not been observed to be infested in cotton growing sections of Arizona. Cotton fields should be watched for plants presenting unusual appearances in order to detect this or other cotton pests before excessive damage is done. Weeds growing along roadsides or on the sides of fields should also be kept under observation or better still should be kept down. This will sometimes prove as important as cultivating or irrigating in producing a successful cotton crop.

After the red spider invades a cotton field two methods of checking it are available. First: when only a comparatively few plants are infested these may be pulled up and burned. Second: when the infestation is widespread control by spraying should be resorted to. For this purpose the best spray, so far as known, is made by dissolving one ounce of potassium sulphide in two gallons of water. The spray may be applied with a suitable garden sprayer if the infestation is limited to an acre or two of cotton. If the infestation covers several acres, however, a barrel pump carried on a wagon will be needed. Information concerning sprayers suitable for spraying cotton and other plants for the control of the red spider may be secured by applying to the state entomologist at Phoenix.

## Alfalfa Growers Association

Southern California alfalfa growers have organized in order to secure fullest possible return for their products. We have from the secretary, J. L. Farrar, the following statement of the methods of work of this organization. Mr. Farrar's address is Corona:

"The above organization has been going for some 12 months and up to the present time seems to have been very successful. It was started by the farmers in order to cooperate to get better prices for their product.

"The organization is made up of farmers. They elect an executive committee and officers to look after the business of the organization. These meet twice a month and discuss selling methods, market conditions, and matters of interest to the alfalfa grower. A central office is maintained with a man in charge, and through this office those members of the association who wish can sell their hay, the cost being to them 50 cents per ton. The central office in turn has connections with a broker in each county in Southern California, and he is allowed the 50 cents for handling

the hay. Thus the farmer's hay is handled at a minimum of expense and he is always assured the true market price. We have found that buyers going through the country greatly misrepresent market conditions. We keep in touch with the markets each day and inform the farmers of true market conditions.

"The expense of the central office is maintained by a levy of so much per acre. Next year we figure it will cost each member about 40 to 50 cents per acre for the running expenses of the organization. But that is cheap when you consider that this year we have brought the farmer a net increase for his hay of about \$3.00 per ton. Before it was the middleman who was making the profit. Our purpose is to prevent this and turn that profit to the farmer."

An apple grower of Watsonville, California, recently made a trip through the Northwest and finds apple crop prospects excellent. Rough estimates showed that Walla Walla will produce 500 cars, Yakima 3500, Hood River 1200, Medford 500, Wenatchee District 8000, Spokane 650, Southern Idaho 2200, Lewiston, Idaho 250.

# PLANT SUDAN HAY NOW!

Help your country tide over the hay famine—and make

some easy money yourself in doing it. Sudan grass is a wonder plant—grows like a weed in any soil. Produces eight to ten tons of sweet, nutritious hay per acre each season. Keenly relished by all types of stock. Thrives best during warm season. Crop matures in 50 to 60 days. Hay prices are soaring—plant Sudan now! Our big, free illustrated folder by return mail.

## Special Prices

Single pounds (enough for 50x50 feet)—36c.  
10-lb. lots (will plant half an acre, sown broadcast)—34 cents per lb.  
25-lb. lots—32 cents per lb.  
100-lb. lots—28 cents per lb.

**Saturday, August 4, 1917****OUR ADVERTISERS RELIABLE**

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

**THIS WEEK'S COVER**

California produces well up toward 10,000 tons of dried figs annually. Perhaps that figure will be materially exceeded this year. Compared to some of our other dried fruits, particularly raisins, these figures are exceedingly small but show possibilities of the development of a great industry. We hope it will make a showing equal to that of the California Black fig on the cover of this issue. This magnificent tree is located in Napa County where it was planted by the padres in Old Mission days. For drying this original type of fig has been largely supplanted by the Smyrna or other lighter colored figs, but for eating from the hand and for perishable market there is no finer than the old Black fig.

**HEADLIGHT LAW**

There have been so many accidents caused by defective headlights that practically every motor driver welcomes the new headlight law which went into effect, July 27. Presumably every auto owner has had his lights adjusted and dimmed according to provisions of the law, given on another page of this issue. We believe the new law will result in fewer accidents.

**EAT CORN**

In referring to the necessity of conserving wheat an Eastern paper remarks that while the American people are willing to forego their wheat bread to a limited extent to supply European consumers "our friends on the other side must share in the use of the inferior grain." Maybe corn is inferior to the more aristocratic wheat, but a good corn hotcake or muffin or now and then an old-fashioned bowl of mush and milk is no serious punishment for most of us.

We are willing for our share to take several rations of the "inferior grain," and California is growing more of it than ever before.

**ENCLOSE STAMPS**

Occasionally the writer of an article or an item to be used in our columns particularly specifies; "Do not give my name or address." This is often because many contributors have found that when they do permit their names to be used a flood of correspondence comes from interested readers who, while asking information of interest to themselves, forget to enclose the usual stamp for reply. Two cents is too small to mention, but where these requests for letter answers run into the dozens, the writer of the helpful article, while he may be willing to take valuable time to give the requested answers, when he discovers that he is fined for postage stamps in addition, usually rebels.

**PHOTOS**

We have often asked our subscribers to bear in mind that we are always glad to use photographs of different sections of the state in illustrating our columns. Note on page

**BETTER BE PREPARED THAN REGRETFUL**

Fires thought to be incendiary, at least in many cases, are occurring in all parts of the state. Whether incendiary or otherwise, it is the season of the year when the greatest care should be exercised by every Californian. Whether in field or forest, barn or home, every possible precaution should be taken. There are excellent fire extinguishers "ready to use," but the barrel of water, with plenty of sacks for wetting, a supply of buckets, and boxes of loose sand or dust, shovels, and other appliances which aid in extinguishing fire, should be provided.

A little bit of preparedness is worth tons of regrets.

101 of this issue where Mr. Shaffer is trying to reach the top of the product of one alfalfa root. This is a striking example of what California soil and climate will produce. It is a most interesting photo. Also note the Napa County big fig trees on the cover. Hardly a handsomer illustration could be imagined. These are good advertisements for the sections from which they come. Send in the photographs with pencil memoranda lightly written on the back, giving information regarding the place taken and other items of interest.

**STATE OWNED TRACTORS**

The advantages to farmers from the improvement in tractors and other farm power is becoming more and more apparent. The Kansas council of defense has taken steps to make a complete tractor census of that state. Other states have taken count of the number of their machines and have urged upon tractor owners the importance of keeping them busy as nearly 24 hours a day as possible. If their own farms are not of a size requiring their continuous use, the machines should be kept occupied on other places. The state of New York, finding a shortage of farm power, invested state monies in tractors which were distributed to advantageous points, and these are being used in the production of a greater amount of food.

**STATE AID**

Since the adjournment of the legislature we have had nothing exciting regarding the state market commission. Mr. Weinstock has won his point and is now offered the opportunity of a lifetime. The farmers have answered the call to "feed the world"; they now need a market or, rather, a medium of reaching the greatest market ever offered to Amer-

ican farmers. Whether it is better transportation or elimination of middlemen or securing just returns from the middlemen we are not certain, but sure it is that with more products of the farm, marketing conditions are not satisfactory.

In Riverside County there has been a combination of the county council of defense, the farm bureau and other forces, which is working satisfactorily.

**WHO'S WHO**

On page 112 of this issue starts a series of short articles on breed leaders. In a word this is the "Who's Who" of California livestock. Animals in all parts of California, which have shown their worth by their performance will be reported in these columns.

Another week the columns of the Cultivator will be open to another series of articles concerning the humans who are responsible for producing some of these great breed leaders. California has made a name for itself in a livestock way. The men to whom credit is due for this will be chronicled in this department, both with pencil and camera. It is planned for

tion by the federal government has proved that court plaster inoculated with the germs of tetanus, or lockjaw, has been peddled in this country. Arrests of peddlers have been made, two in California.

The dark ages showed no more cruel—no more damnable—methods than the Present Great World War. Non-combatants and the defenseless, even in the country of the enemy, have seldom appealed to soldiers of civilized peoples in vain. This war has reversed ideas, and the world is asking: "Is the human becoming more savage and brutal?" "What will be the next step in the slaughter of innocents?"

**Agricultural News Notes**

Missouri reports all wheat and oats in the shock.

A tractor demonstration was held at Brandon, Manitoba, July 16-20.

New York is taking up the matter of aiding in the marketing of farm crops.

The International Apple Shippers' Association will meet in New York City, August 15.

The National Tractor Demonstration at Fremont, Nebraska, will be held August 6-10.

Iowa's garden production of foods has increased more than 300 per cent over that of last year.

The state fair at Minneapolis makes a special feature of its tractor exhibits, and demonstrations.

Fertilizer dealers have received orders that all cars used in shipping fertilizer must be filled to the limit. Dealers are also urging orders at once for next season's delivery.

Humogen, a much advertised "fertilizer" offered to English farmers, has been tested at Rothamsted and found to be absolutely inert. It was claimed to be a form of bacterialized "peat."

Connecticut has just enacted a law to control the practice of stealing fruit, a form of petty theft common with "best intentioned" people. It provides a fine of \$100 or six months imprisonment in jail.

With Florida limes going to market at \$10 and \$11 per barrel the Florida growers are strictly in clover. West Indian lime growers are also a big factor in the Eastern market. Florida produces about 10,000 barrels of limes.

The hillsides of Sac and Ida Counties in Idaho are said to be the world's popcorn center. The section covers about 5345 acres, on which are produced 197,322 bushels of popcorn. The growing season covers about 130 days.

The use of fertilizer has greatly increased in the United States. The state using most freely is Virginia which makes an application on an average of 400 pounds per acre. The South uses far more fertilizer than the North.

The Ontario province of Canada contemplates the purchase of a tractor for every county in the province. It is now estimated that the Canadian yield of wheat this season will approximate 42,000,000 bushels. Sixty-three per cent of her winter crop was abandoned.

Chemists in Great Britain have discovered a substitute for basic slag in a substance which they term tetraphosphate. It is prepared by mixing powdered phosphorite with carbonates of alkaline earths and heating in special ovens. The mass contain 20 per cent phosphoric acid.

**SHORT CROPS**

From information sent out by the International Institute of Agriculture at Rome it appears that the world over, there will be a material shortage of foodstuffs this year. The efforts of the United States to meet the world's shortage have resulted in far greater planting, and doubtless in far greater production. The past few months proved disappointing, however, in some sections of the Middle West, for intense heat has followed weeks of drouth, and the corn is withered, but it is hoped that this drouth will soon be broken and that the vastly increased planting will still permit this country to produce in excess of its ordinary 3,000,000,000 bushels of corn. The crops of winter and spring wheat, both together, will be greater than in former years.

The Institute reports that in northern and central Europe the drawbacks resulting from the length and severity of the winter are still seriously felt. In the greater part of Russia, both European and Asiatic, temperatures below normal have prevailed to a disastrous extent.

**COURT PLASTER**

Don't buy of peddlers; buy of known reputable dealers, especially if one is buying foods, drugs or any proprietary articles which give opportunity for introduction of deadly infectious diseases into the home.

The court plaster story was at first declared to be from the imagination of the reporter, but careful investiga-

# Agricultural News Notes of the Pacific Coast

## Northern California

The first grapes from Vacaville, Solano County, were forwarded July 8.

The Sixth St. Helena Vintage Festival will be held August 31 to September 3.

Butte County's peach crop will be 5000 to 7000 tons greater than that of last year.

Apple growers of Napa County recently met and discussed the apple standardization law.

Napa County schools are to remain closed so long as helpers are needed in the fruit harvests.

The university farm at Davis wishes names of milch goat breeders who have animals for sale.

Butte County grain fields have stalled some of the combined harvesters because of the heavy straw.

A beet dump is to be erected at Davis, Yolo County. One rancher near here has 1000 acres in sugar beets.

Butte County is deputizing men to act as deputy sheriffs in protecting the crops of the county from incendiaries.

Hops have advanced from eight to 12 cents during the past two weeks and growers are anticipating still higher prices.

Chinese eggs are again being received in California ports, but an effort is being made by egg producers to stop their importation.

The State Poultry Association proposes to follow up its members who violate contracts made to market through the association.

The Napa County Fair Association has chosen the dates of September 22-26 and has named a bunch of committees to push for a big fair.

The state purchasing agent has been working in Alameda County to secure hay for state institutions. His plan has been to buy direct from the growers.

The Rice Products' Company of America has been incorporated at Gridley, Butte County, and will process and put in cartons high grade California rice.

The state reclamation board is consulting with engineers and trustees of levee districts along the Sacramento River, endeavoring to adjust levee assessments.

There will be constructed at Fyffe, Eldorado County, an apple evaporator to handle apples and other fruits of that section. This is the first fruit evaporator in that county.

It is announced that Mr. Burbank has developed a variety of wheat which will yield five times as much per acre as the average of wheat production throughout the United States."

A Vacaville peach dryer is succeeding in "peeling" his peaches by sulphuring heavily and removing the entire peel before the trays are placed in the sun. The fruit has to be exactly in the right condition of ripeness.

The Central California Berry Growers' Association, made up of producers in the great central valley, is being "investigated" because of a charge that they are working "in restraint of trade." They have little fear but that they can prove their organization to be purely one of cooperative producers.

## Central California

The Tulare County grape crop is 120 per cent of normal.

Tulare County creameries disbursed \$130,000 last month.

Leroy B. Smith is to be the farm adviser of Fresno County.

Lindsay, Tulare County, shipped out 500 cars of Valencias.

Eleven cars of Tulare County Valencia oranges netted \$11,678.

Kern County is estimating its output of food crops this year at \$10,000,000.

The price of dried peaches made two advances within three days' last week.

Dunkards are settling in the Waterford Irrigation District, Stanislaus County.

The Stanislaus Fair and Live Stock Show will be held in Modesto, September 17-22.

The grain acreage of the Tulare Lake District will greatly increase another year.

Oakdale, Stanislaus County, is building a \$100,000 flume to extend its irrigation system.

The Stanislaus County Live Stock Show and Exposition will be held at Modesto September 17-22.

Porterville, Tulare County, bean growers are combining and organizing a drive on the jack rabbit.

Carl Nichols, associate farm adviser at large for the state, is with County Farm Adviser Grass of Merced.

The date of the grape growers' meeting which was to be held in Lodi, July 21 has been changed to August 11.

Porterville potato growers propose to make potato buyers stand by contracts made earlier in the season at \$2.50 per cwt.

Two Indians of Fresno County who understood that jimson weed made an excellent beverage proved it out and died as a consequence.

Oakdale, Stanislaus County, is to build a warehouse for sulphuring and hulling almonds. The output this year will be its largest.

Fred K. Howard, horticultural commissioner of Kings County, is now waging a county-wide campaign against ground squirrels.

Dinuba is to have another cooperative growers packing company. Its name is Dinuba Fruit Growers' Company and J. F. Williams is president.

Modesto, Stanislaus County, is promised a branch of the Borden Condensed Milk Company, which will handle 100,000 pounds of fresh milk daily.

Fresno fruit interests are endeavoring to secure the location in that county of white American families which will be an aid in the fruit harvesting season.

An Exeter hog feeder has found that in finishing his hogs for market a liberal ration of raisins gives a flavor and quality of pork not to be secured by any other feed.

Kings County creameries report the last as one of the most successful months in its history. Central Creameries of Lemoore and Riverdale paid 39½ cents for A grade and 37½ for B grade; Laton, 39; Lucerne, 39½; Swift and Co., 39½; Maple Grove, 39½; Riverside Cooperative, 41; Corcoran, 38½.

## Southern California

The new fruit law takes effect August 1.

The Oxnard sugar factory opens August 11.

The market for all kinds of beans remains weak.

Orange County's harvesting of sugar beets has begun.

Apricot growers are anticipating prices around 18 or 18½ cents.

Many of the citrus orchards are showing the second, or "off bloom."

Riverside is considering the construction of a vegetable evaporating plant.

Ventura County will hold an agricultural fair, the site and date not yet named.

Imperial County is shipping cantaloupes and watermelons much later than usual.

The Downey Community Fair committee holds its annual fair this week, Saturday, August 4.

Ventura County reports its present holdings of Lima beans at one-fourth that of the 1916 supply.

Hemet, Riverside County, reports 2500 acres of beans planted in that section, promising a big crop.

Imperial Valley grapes are running around 16 and 17 per cent sugar. The market has proved exceptionally good.

Hemet apricot producers are finding a poor market for apricot pits. Germany has been the principal consumer.

Riverside is anticipating the construction of a factory which will handle and evaporate 50 tons of fresh vegetables daily.

Apple growers of Yucaipa, San Bernardino County, are to organize and cooperate in the marketing of this fall's apple output.

The California Lima Bean Growers' Association recently made a payment of over \$200,000 as the fourth installment from the Lima pool.

Imperial Valley will place a weir across the Colorado to divert water at its heading and will put up a \$100,000 guarantee bond to make good any damage caused by the weir.

Beet growers of Chino, San Bernardino County, recently met and discussed beet hoppers and the hiring of a chemist and tare man to be on duty at the Southern California factories.

Hemet, Riverside County, has had thousands of outside helpers in canneries and dryers and at one time had difficulty with I. W. W's. who were endeavoring to upset labor conditions.

The San Antonio Growers' Association cannery at Ontario recently found itself with 150 tons of apricots without sufficient help. The use of telephone soon brought additional helpers from surrounding towns.

Fruit growers have proposed to have full returns from crops in this year of high prices and in some sections have appealed to county sealers of weights and measures for establishment of just tare on orchard boxes.

San Bernardino County citrus growers who at first appealed to the board of supervisors for change in valuation by the assessors have changed their appeal to a reduction in the rate. To do this a reduction of county expenditures will be necessary.

## The Coast

Cherries are ripe in Wenatchee, Washington.

Arizona's state fair will be held November 12-17.

Arizona hay shipments are in excess of former years.

Several new cotton gins will be erected in the Salt River Valley.

A 35,000 pound car of mohair was recently shipped from Albany, Oregon.

Idaho wool growers are selling the new clip at around 58 cents per pound.

One cherry cannery at Cove, Oregon, is putting up over 400 tons of cherries.

Bellingham, Washington, creameries are paying around 46 cents for butter fat.

The first raspberries from Bellingham, Washington, were shipped out about July 16.

The cantaloupe shipping season began at Chandler, Arizona, about the middle of this month.

Several thousand feet of film have been taken of scenes in the cotton fields and camps of Arizona.

A Hampshire breeder of Oregon recently sold a carload of pure breds at an average of \$32.50 per head.

A streak of hot weather about the middle of July did serious damage to truck farmers near Dallas, Texas.

Cotton growers at Chandler, Arizona, recently met and discussed the matter of labor for the cotton harvest.

The state normal school at Lewiston, Idaho, is conducting a summer school of preserving, canning and drying.

Roosevelt Dam is again overflowing and alfalfa and cotton producers are assured of at least two year's irrigation.

The Salt River Valley Cotton Growers, Arizona, have fixed upon a two and a half cent price for picking cotton.

The first full car of butter was recently shipped from the Payette Valley of Idaho. It contained 21,983 pounds.

Colorado truck farmers are shipping cabbage, but celery and cars of mixed vegetables will not start until early in August.

A land company at Twin Falls, Idaho, is beginning the reclamation of 580,000 acres in Owyhee and Twin Falls Counties.

Several of the county agricultural agents of Arizona are making complete agricultural maps and surveys of their counties.

Six months ago Arizona had three county agricultural agents. Today it has 11, leaving but three counties in that state without agents.

Okanogan County, Washington, has greatly increased its output of hogs and is also materially increasing the number of dairy cattle in the county.

Snohomish County, Washington, farmers have been inconvenienced and caused material loss because lumber camps have drawn so largely on the farm laborers for help.

Salt River Valley, Arizona, has planted 40,000 acres of Long Staple Egyptian cotton. The crop is expected to produce about 16,000 tons of seed, which will yield 600,000 gallons of oil.

# LAYNE & BOWLER PUMPS

## Valuable Information for Prospective Pump Users

If you plan to purchase a pump you should exercise extreme caution. Our interesting catalog gives up-to-the-minute knowledge on pumps and irrigation and tells about the different kinds of systems. This information has been compiled by us at a cost of thousands of dollars. Be sure to ask for Catalog No. 30.

**Layne & Bowler Corp.**  
900 Santa Fe Ave. Los Angeles

## BRENNEIS Bean Harvesters

This illustrates our well known two row riding bean harvester. It is of first class mechanical construction made of strong seasoned wood and best grade steel. Cuts and windrows two rows of beans at a time. Easily controlled from handles projecting from rear. If you have a crop of beans don't take chances at present prices on unfavorable weather. Better have proper and plenty of labor saving machinery to handle the crop quickly. We make special designs to order. Buy our successfully proven bean machinery and be sure of satisfaction. Owing to the greatly increased acreage of beans we suggest that you place your order for harvesters early.

## August Vegetable Planting Calendar

### Northern California

Written for California Cultivator By A. R. Gould

**FROM NOW ON** for a few weeks it will not be possible to neglect any crops in the way of water and the liberal use of the hoe or cultivator.

Indeed this work will take up all our time and that of harvesting the crops. It is now too late to plant very much except lettuce, endive, carrots, turnips, radish, and towards the end of the month perhaps our winter cabbage, Brussels sprouts and kale will need transplanting.

Many root crops will now be ready to dig and can be stored in a shed, or the basement will prove excellent for this purpose and we shall deal with this more fully later on in this column.

**Celery**  
It will be time towards the end of this month to tie up the stalks of the variety known as the Golden Self Blanching, and this will assist blanching or the bleaching white process which takes place toward the center of the plant. Use raffia, a good tying material for this work. The varieties White Plume or Columbia may be blanched by tying brown paper or sacking around the stems.

#### Tomatoes

Follow out the directions as given last month in regard to these, and if they are being grown on the single stem method watch for the axil growths and remove them. It is a good plan to shake the plants every few days as this will help to fertilize the flowers and for a few weeks some varieties do not set well, especially in certain localities. Too much moisture in the atmosphere will also prove detrimental and cause the flowers to drop off. It is not advisable to water the plants too often from now on. Keep a close watch for aphids.

#### Turnips

It is possible to keep up the supply of this useful vegetable by sowing Early Snowball and the other varieties mentioned last month. Soot forked in lightly between the rows makes excellent fertilizer.

#### Radish

Sow winter varieties such as Chinese White Winter and Rose Winter and Early Scarlet Turnip and Long Scarlet for use in a few weeks. Keep this crop well supplied with water.

#### Lettuce

It will be possible to secure many plants from the sowings made last month and these, if carefully transplanted, watered and cultivated will provide good heads, but for a later supply sow Iceberg, which will stand the hot weather well and May King which makes rapid growth and is of fine quality.

#### Endive

This is an excellent vegetable for use as salad and may be used with lettuce. This may be cultivated practically the same way as lettuce, but just before maturing it should be blanched. The best varieties are White Curled and Giant Fringed.

#### Carrot

Continue sowing the varieties as mentioned last month to keep up the supply. They will keep in the ground for some weeks after maturing if water is withheld and, then later they will be found of great value for storing. Constant cultivation between the

rows is essential and will mean less watering.

#### Beans

This crop should now be ready to harvest, and the varieties will provide enough for present use in green podded state and in a few weeks for use as shelled beans. The later crop will need careful drying.

#### Winter Cabbage, Brussels Sprouts and Kale

Toward the end of this month the varieties sown last month should be ready for transplanting and meantime the plot should be well prepared, especially that portion intended for the Sprouts, as these require ground heavily manured and well repay any extra trouble.

#### Potatoes

The early crop will have been used up probably ere this and this month the main crop will be ready to dig. Do not dig these to store, until the tops have become completely yellow or dried as if the tuber is handled until fully mature it is likely to become diseased. They may be stored in dry sand in a dark cellar or basement or even in a heap outside if a small cover is placed over the heap. Examine tubers very carefully for any sign of fungous disease before storing.

#### Storing Vegetables—Dry Method

That it is a patriotic duty to help solve the food shortage problem no one will deny, and furthermore, speaking generally, the situation demands much thought and practical application. The need for storage was always there long before this unfortunate world

crisis came on, and this dry method was practiced successfully by private gardeners in England years ago. The farmers had a similar method for storing their beets and potatoes by the ton in well covered heaps out in the open field. If by storing up the surplus we have produced this year we can benefit mankind and perform a patriotic and sensible act we should do all we can in this direction. Only labor and some dry material is needed, and the following crops can be stored as ready: Carrots, beets, turnips, parsnips, rutabaga or Swede turnip.

These root crops should be carefully dug and the green tops should be cut off, but it will not be necessary to wash them. In fact they are not liable to keep so long if washed. But remove as much soil as possible and make a layer of dry sand or coal ashes one inch deep on the floor of the basement or cellar, then place a layer of the root crop. On this put a layer of sand or ashes, half an inch, then another layer of vegetables and so on until you have a good mound and have stored away those you are not likely to need for some months to come.

It is essential that they should be stored in a perfectly dry place and that no moisture should penetrate the mound; otherwise many of the root crops will be ruined and some start into growth.

Main crop onions should be well dried in the sun after being pulled and then strung up by the tops on a three-foot rope and hung up to the roof of the basement or some other dry place. It is best to hang them or tie them on the rope in alternate fashion. See that they are not bruised in any way. Some of the early and smaller type of onion may be hung up in bunches and will keep quite a long time. Of the main crop or long keeping varieties, Australian Brown, Ailsa Craig and Prizetaker are the best.

## Southern California

Written for California Cultivator By D. F. Reichard

**SO IMPORTANT** are the summer months for starting gardening in California that many of our leading authorities begin their planting calendars with either July or August operations.

The all important thing in starting a fall garden is to get the desired plot thoroughly soaked, preferably before plowing or spading. There should be applied water to the depth of at least four inches over the ground, which is equivalent to 7500 gallons for a city lot, or 50,000 gallons per acre. This will do for crops such as corn or beans that come up quickly and that can be cultivated and furrowed out for a subsequent irrigation in a couple of weeks, but for most garden crops another flooding equal to the first should be applied after the ground has been worked up from the first soaking. After the second wetting work up the soil and pulverize thoroughly to give a good seed bed. All this work may seem superfluous to the amateur gardener but it is very necessary that the ground to be planted during the summer or fall months should be well filled with moisture before the seeds are put in. This gives them ample time to germinate and get out of the ground before another wetting is required. Plant all stuff in rows so that the garden may be subsequently irrigated in furrows made between the rows of plants.

For those who have gardens made the same plan of procedure for start-

ing vegetables where crops have been harvested should be taken—thoroughly soak and work the plots for the reception of seeds.

In Southern California nearly all varieties of vegetables may be planted with success. Beans and sweet corn will develop in all but extremely cold sections. Potatoes are planted very extensively during the early part of August as they stand considerable frost during the later part of their growth. Sow seed of cabbage, cauliflower, Brussels sprouts, parsnip, rutabaga and kohlrabi for early winter use as these all produce the best during cool weather. Plant beets, carrots, radish, lettuce, spinach, turnips and bunching onions for succession. In the upper valleys cucumbers and summer squash and muskmelons, casabas and watermelons will make for late crops. In protected sections along the foothills tomatoes and peppers may be started for winter crops.

Some years early onions started during August make all right, but if there is a warm late fall many of them will run to seed. Rhubarb started now will give good strong plants for setting out next spring.

The state market director is endeavoring to hold a line on the potato market and get the potato growers in each county organized.

A barge of 14,000 sacks of grain struck a snag and sank in the Sacramento River near Meridian.

## August Ornamental Planting Calendar for Northern California

Written for California Cultivator By A. R. Gould

**T**HIS MONTH we should keep watch for insect pests, collect seed, prepare plans for our spring garden and sow seeds of various perennials

which will provide us with bloom the following summer. It will also be a good plan to make up a propagating bed in a warm but shady corner, in which cuttings of a few subjects such as daphne, Buddia, veronica, heather, hypericum, euonymus, privet, box, honeysuckle and deutzia, all flowering and evergreen shrubs and climbers, may be inserted. If you can fix up a box, filled with sand or sandy soil, and cover it with a window sash this will make a fine propagating frame. When selecting the cuttings see that none are flowering shoots. Cuttings of arabis, aubretia, alysium and viola may also be placed in the propagating frame now.

### Dahlias

Thrips, a small white insect, appearing on the underside of the leaves and young shoots, has made itself a source of trouble to many growers and should be looked for. Spray with a nicotine solution to keep this in check. The leaf eating beetle (*Diabrotica* soror) is also busy just now and will need hand picking. Mulch the dahlias with horse manure. When watered in it will form a good stimulant.

### Climbing Roses

Tie in all long shoots of these whether on the fence or on the wall. These shoots will provide material for next year's bloom.

### Seed Sowing of Perennials

Collect seed of hollyhock, lupins, digitalis, aquilegia, or columbine, gailardia, delphinium, geum and sweet

William and sow this on a shady but fairly warm border, and these will develop into flowering plants for next year. Keep them well watered and watch for slugs.

### Pansies

Seed can also be collected from these, and many young seedlings will also have made their appearance by this time in the flower beds. These can be transplanted and given a better chance.

### Perennial Asters or Michaelmas Daisy

These will now be coming into flower, and most of the varieties will require stakes for support. They will produce a wealth of flower for a long time.

### Selection and Taking Notes

Now that most of our choice flowers are at their best it is important that we should make notes of observation as it not infrequently happens, owing to the ways of nature, that there may be new types developing, and it is more than fascinating to watch this process. It may be that you planted a batch of seedling gladioli or hollyhocks, or even delphiniums, and amongst these some may be worth propagating largely. In this case now is the time to label them carefully for seed selecting later on. The same applies to dahlias, among which there may be many types worth saving.

Many beautiful flowers have been lost through the fact that many have neglected to give this matter of selection their attention. Nature is no respecter of persons and distributes her gifts to one and all. We owe many excellent types now in cultivation to the fact that they originated in some humble garden, and yours may yet be the home of a novelty.

## Contact Sprays for Aphids

**A**CCORDING to specialists in the United States department of agriculture, contact sprays are the only effective means of controlling the various kinds of aphids, the small insects which by feeding upon the juices of the plants do much damage to the fruit and foliage of orchard trees, currant, gooseberry and grape. As the aphids do not eat the plant tissues but drain the sap from them the various kinds of sprays containing stomach poisons, such as Paris green, arsenate of lead, etc., are ineffective. To do any good the sprays must come in contact with the bodies of the insects and great thoroughness in spraying is therefore necessary.

Nicotine has been found to be one of the most effective substances for killing aphids, and as it may be applied with entire safety to plants it is possibly the best suited of all the substances used in the control of these insects. The cost of the concentrated article is high, but as it may be greatly diluted the actual cost of applying the spray compares favorably with that of other contact sprays. Of the commercial preparations the 40 per cent nicotine sulphate is the solution in most common use. Weaker grades may be used if care is taken that the spray is made up to contain not less than 0.05 or 0.06 per cent of actual nicotine.

Washes made of fish oil or laundry

soap are also effective against aphids, and are especially suitable for use on a small scale. The fish-oil soap of different brands on the market varies greatly in water content, so that the precise quantity of soap to be used with a given amount of water will vary also. Manufacturers, however, are required by the Federal Insecticide Act of 1910 to state on the label the amount of active ingredients, in this case soap, and of inert ingredients. This will enable purchasers to make up a solution which should range from one pound of soap for five gallons of water to one pound for seven gallons, depending upon the amount of water present in the soap. As has been already said, soap should not be added to lime-sulphur solution. Nor should lime-sulphur solution be added to kerosene emulsion. This last may be used against aphids at the rate of one gallon to seven or eight gallons of water. The stock solution for this purpose is made according to the following formula: Kerosene, two gallons; fish-oil or laundry soap, half pound; water, one gallon.

### HOW TO CAN TOMATOES

Select firm, well-formed tomatoes. Scald  $1\frac{1}{2}$  minutes or until skins loosen. Dip quickly into and out of cold water. Peel and remove stems and cores. Pack directly into cans or hot jars. Press down with a tablespoon (add no water.) Add a level teaspoon of salt per quart. Put the rubber rings and caps of jars into position but do not tighten fully. Seal tin cans completely. Place the packed containers on a false bottom in a vessel of water sufficiently deep to cover them by one inch and allow to remain at a boiling temperature for 22 minutes when using hot water bath canners.

## The Dependable Hired Man

If you had a hired man available at any hour of the day or night--ready for all kinds of work, in the house, in the barn or out in the field--your greatest trouble would be over.

**G-E Motors** can do all this and more. Practically every farming operation can be performed cheaper, quicker and better by the use of G-E electric motors.

Ask your local power company what G-E Motors will do for you--or write our nearest sales office or G-E Motor Agency for detailed information.

### CLEAN TROUGHS

**A** YOUNG MAN who has had training at the university farm at Davis recently took charge of a herd of hogs. He was not pleased with the condition of the troughs in which the water was supplied and the grain fed. They were just ordinary wooden troughs such as hundreds of farmers have. So his first work was to give them a thorough cleaning. He first washed them out with water, then with a sheep dig solution, finishing up with a lime whitewash which left them sweet and clean. This is repeated once a week.

### PAINT THE NAVEL

The lives of many colts and calves can be saved if the navel is painted with iodine as soon as the animal is born. It is best when this is done before the navel has a chance to touch the ground or become contaminated in any way. If this is not done give the navel a thorough application as soon as possible.

Many germs can obtain access to the body of the young animal through the navel, and some may cause death. Sometimes this may not be the first day, but the animal may linger along for a week or so, but the cause of the death would be the entrance of some germ by way of the navel soon after birth.

It is an easy thing to have a bottle of iodine on hand, and it is a simple treatment to give.

### MUCH WATER NECESSARY

If a horse perspires 6.4 pounds—or over 3 quarts of moisture at rest; and 14 pounds, or about 7 quarts working at a trot, in 24 hours under ordinary conditions, the amount must be greatly in excess of this during the dry hot weather in California's interior valleys.

Added to this is seven pounds or about three and one-half quarts of moisture given off through the lungs and fat secreted and given off by way of the kidneys.

Animals suffer, and lose in weight

and condition, when they are not supplied with an abundance of pure water during this hot weather.

### USEFUL PONIES

You never realize how many really useful things the children can do on a ranch when they have a pony and cart or a little buggy.

They can make dozens of trips to town for repairs and supplies. They

Shetland ponies and ponies a little larger than Shetlands are very strong. Ponies 36 to 42 inches high, and weighing 325 to 400 pounds, travel 30 miles a day and draw a 1200 pound load on rails in the mines in the Shetland Islands. Because of the small size of the Shetland, it is frequently crossed with the Welsh or other larger ponies.

Welsh ponies are noted for their

## Practical Veterinary Science

Written for California Cultivator By F. M. Hayes, Assistant Professor  
of Veterinary Science, University of California.

**T**HE FARMER who will take the opportunity to attend the short courses at the university farm from September 24 to November 2, 1917, will

add to his stock of knowledge much information that can be practically applied to the conservation of his live stock through the prevention of disease.

### COLLEGE of AGRICULTURE

Throwing a horse

Vaccinating for Hog Cholera

A Patient of  
the Veterinary  
Clinic

The age of "wolf in the tail" and "hollow horn" is fast disappearing before the march of progress and enlightenment. Colts and calves are no longer altered by the phase of the moon. Science is continually bringing to light sensible and practical facts in relation to the causes, treatment, and control of animal disease.

The lectures and demonstrations by the veterinary science division during the farmer's short courses, September 24 to November 2, are for the purpose of teaching the student the essentials and fundamentals only of the prevention and control of diseases of animals, which will add income to the farmer and more than a "bit" to the

on digestive diseases of horses, including colic, on diseases of sheep, especially the parasites; on hog cholera and other diseases of hogs; on such widespread diseases as tuberculosis, blackleg, anthrax and contagious abortion; on retained afterbirth, calf scours and pneumonia, and udder troubles; on the treatment of various kinds of wounds; on the common unsoundness of horses, and on other subjects as may be brought up for discussion.

The University of California college of agriculture has for the purpose of giving this work to the Short Course students a veterinary building equipped with a pharmacy, surgical instru-

Give the sow a small feed of shorts and skim milk slop for two days before parturition.

In the farrowing pen place a two-inch by four-inch scantling eight inches from the floor and six or eight inches from the wall to prevent the sow from lying too close to the wall.

Provide the sow with a small amount of clean bedding.

Be on hand during the act of "pigging" to lend assistance in case of abnormal presentations.

Remove the mucous from each pig's nose as soon as it is born so as to allow breathing.

If the sow is feverish, restless, and consequently irritable, place the new

and the tonnage. Owing to the high prices being received for dry wine grapes for shipping East, it is doubtful if there will be general use of the fruit for stock. But properly handled, a large proportion can be so fed as a war emergency.—Sun-Maid Herald.

#### MEMORANDUM

The executive committee of the California Creamery Operators held its regular quarterly meeting at Petaluma last week. The time was entirely devoted to consideration of date and program for the coming annual convention of the association. The committee fixed upon October 4, 5, 6 as the dates. It conferred with officials of the Petaluma chamber of commerce regarding number of features of entertainment. A tentative program was arranged.

Cultivator readers are assured that there will be many new and attractive features on the program. More attention will be paid to the social side of the convention and members will be urged to bring their ladies. Petaluma is an ideal convention city. It is located in a good dairying section with two large and prosperous creameries located within the city limits. The efforts these two creameries will put forth, combined with the boost spirit that prevails in Petaluma, is all the assurance that anyone could want for an interesting and enjoyable convention.

The Cultivator will publish more details from time to time.

#### JERSEY CATTLE CLUB ACTIVITIES

R. M. Gow, secretary American Jersey Cattle Club, and Wallace MacMonnies, chief of the extension department, accompanied by Field Agent McLouth of Orland, will make a tour of California beginning at El Centro, August 14.

A five mile "dry zone" around military camps has been ordered by the president.

Kings County Poland Chinas  
Prize Winners on the Ranch of W. Bernstein near Hanford

necessary increase of animal food products.

Practical exercises in the examination of animals for such normal functions as the temperature, the pulse rate, the number of respirations, the heart, lung and abdominal sounds, are carried out. Demonstrations in making the tuberculin tests, administering anti-hog cholera serum, castration, spaying sows and heifers, dehorning, administering the milk fever treatment, injecting blackleg vaccines, giving medicines, throwing and restraining, bandaging and wound treatment, are all given during the courses, and in so far as possible the students take actual part in the exercises. The course is made as practical and interesting as feasible; the clinical work is supplemented by lectures, often in conjunction with clinical material, on digestive diseases of cattle, such as bloat, impaction of the stomach, etc.,

ments, bacteriological laboratory, and a hospital barn and stocks for the handling of animals affected with any disease. There is an abundance of clinical material available not only from the large number of animals owned by the university, but also from subjects brought in by farmers around Davis. The university farm maintains a clinic during the college year to which farmers may bring their animals and have them treated or have them prescribed for at the actual cost of materials used. Over 3000 animals have been treated in this manner during the past year. The Short Course students have an opportunity of seeing many of these cases during their six-weeks' course. In presenting this work to the farmer student the college of agriculture through the veterinary division, hopes to fulfill two of its most important functions — those of instruction and public service.

born pigs in a basket warmed by a hot-water bottle until the sow has finished farrowing when the youngsters can be placed to the teats without having been injured.

Remove the afterbirth and soiled bedding from the pen and bury it.

Do not disturb the sow by offering her feed for 12 hours after farrowing, but provide water to quench her thirst.

#### DRIED WINE GRAPES FOR FEED

The use of dried wine grapes for stock feed has recently been investigated by the state university farm at Davis. It has generally been considered that grapes at best are a poor hog feed. But recent experiments show that in many cases the grapes have been fed either as an exclusive feed or in too large amounts, causing digestive disturbances. In some cases the hogs cease eating them after a few days.

The recent experiments found that if fed with an equal volume of barley, alfalfa and other foods, the dried wine grapes make good feed for hogs and cows. The grapes should be allowed to become well ripened to decrease the acidity and increase the sugar

## The Brood Sow and Her Litter

By Wm. Hislop, Animal Husbandman Washington State Experiment Station

**T**HOSE who have been long engaged in the breeding of swine know that the new born pig is the mainstay of hog production. The much needed expansion of the industry depends largely upon the number and quality of the pigs that are raised. Many pigs are lost and many more are developed below their capacity because of careless treatment during their first weeks of life.

Happily, the late summer and fall farrowing sows are usually in better

health and more vigorous than those that gave birth to spring litters, consequently little trouble is to be feared. The run of lush alfalfa, clover and bluegrass pastures and the exercise obtained by foraging contribute most liberally to an easy parturition and a robust litter. The greatest danger lies in the possibility that the sow may smash her pigs. This misfortune is not entirely preventable, but the following conditions will reduce it to a minimum:

Have the sow in good physical condition at parturition.

## Shorthorn Bulls and Heifers

We have twenty bulls and ten heifers for sale at present. This is the best lot that we have ever had for sale. Mostly two year olds, registered, tuberculin tested and all reds in excellent condition and splendid individuals. Write for prices or better come and see them.

# Breed Leaders

Every breed of live stock has its outstanding character the same as the human kind. A great dairy cow has proved her ability to produce anywhere up to 15 tons of milk annually; the trotting horse has secured his record around two minutes; the beefmaker has shown his ability to make the least amount of feed into the greatest amount of food; swine, sheep and others of the live stock family have shown themselves great characters.

In addition—and here is where their worth is proven—these animals can transmit their productive power to their offspring, so the breeder seeks these great leaders, and we are glad to devote a few columns to referring to some of these Pacific Coast doers of things. Illustrations of animals of the different breeds will appear now and then with a few notes and performance records.

### PIETERTJE BLOOM

Written for California Cultivator  
By Professor Gordon H. True

N<sup>o</sup> every herd of pure bred animals there is usually at least one individual of such outstanding character as to be counted superior to the

Arthur Edwards, Salem, Oregon; and California Pietertje Pontiac, 137893 (never shown) head of the herd of J. N. Fulmor, Ferndale.

Among her daughters California breeders are all familiar with the names of Fidessa Bloom 110841, who in the herd of Miss M. M. Holdridge

Pietertje Bloom, 66816

A great butter fat producer and a great producer of other butter fat producers. She was bred and photographed on the University Farm at Davis.

rank and file of the herd. Such an one is the old cow, Pietertje Bloom, 66816, in the Holstein herd at the University Farm. "Old Piet," as she is familiarly called, was bred at the Sleepy Hollow Ranch of R. M. Hotaling at San Anselmo. Her mother, Prune Blossom, 52011 was one of four daughters of an old cow of Stanford breeding bearing the name of Preciosa Fatina. Three of these sisters made comfortable advanced registry records in the days when 15 or 16 pounds of fat was counted good. The sire of Pietertje Bloom was Captain Pietertje Netherland, 27416, son of the one time world's record seven day cow, Mercedes Julip's Pietertje, 39480.

Among the sons of the subject of this sketch are to be counted three herd sires; Sir Colantha Juliana 2nd, 98762, head of the university herd, junior champion at the California state fair as a calf, and whose first daughters are just now coming in milk; Sir Pietertje Bloom Fayne, 119325, also first in his class as a calf at Sacramento, head of the herd of

of Modesto made a seven day record of 26.83 pounds fat and sold to the Carnation Stock Farm at the time of the Panama-Pacific for \$1500. Creamcup Bloom and Pietertje Bloom 2nd, other daughters, have seven day records averaging better than 16 pounds of butter fat or over 20 pounds of butter as Holstein men are wont to figure it. The latter has a semi-official yearly record of 587 pounds fat, and a daughter that in the last 80 days with her second calf has made 191 pounds of fat, her best week showing a little over 20 pounds.

Not only as a mother of good ones is the "old cow" famous but her record of production of milk and butterfat is equalled by but few cows of the breed. Others have made outstandingly larger records for a single year, but few have done as well in the test of one year after another. Her average for four consecutive years of 19,447 pounds of milk and 640 pounds of butterfat is a record of performance surpassed by but few cows of any breed.

## Feed From Silo to Save Silage

The diameter of a silo should be limited by the amount of silage fed in a day. Fresh silage, exposed to the air, will soon spoil. This is especially important in summer feeding. If about two inches is fed daily, spoilage will be reduced to the minimum. This means that for a 10-foot silo there should be at least 17 head of stock; for a 12-foot, 25 head, and for a 14-foot, 30 head.

The following table, prepared at Iowa state college, gives capacities for a few of the more common sizes:

Diameter	Height	Tons	Acres to fill	Pounds to feed daily
10	34	56	3.7	525

## An Air-Tight Silo Keeps Silage Best

Practically all the trouble from spoiling of silage comes from the action of air on the material after the first necessary fermentation is over. The first fermentation or "heating" of the green material uses up all the

oxygen of the air which is present in it when it is packed into the silo. If no more air can get in, no further fermentation or decay can possibly take place. If the silo is air-tight, therefore, silage will keep indefinitely. Of

## GET YOUR DE LAVAL NOW

WHETHER you are selling cream or making butter, if you have no separator, or are using an inferior or half-worn-out machine, you are wasting cream, time and labor every day you delay the purchase of a De Laval.

You can't afford to wait another week. It means too much loss with butter at its present high price, and the importance of saving time and labor. Let the De Laval start saving cream for you right now, and it will soon pay for itself.

See the nearest De Laval agent right away and let him show you what the De Laval will save for you. If you do not know the De Laval agent, write direct for any desired information.

## CUTTER'S BLACKLEG PILLS

"California's Favorite"  
for nearly 20 years

For the Prevention of Blackleg  
in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock.

Use any Injector, but Cutter's simplest and strongest.

Prices:

10 dose pkge. Single pills \$1.00

50 dose pkge. Single pills 4.00

10 dose pkge. Double Pills 1.50

50 dose pkge. Double Pills 6.00

Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

SIMPLEX SILO

The Best That Money Can Buy

SANTA FE LUMBER COMPANY  
16 California St. San Francisco, Cal.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

course, most silos are open at the top and some spoilage will take place from the top of the mass downwards. But this can be prevented in large part by covering the silage, after it has finished settling, with a layer of chopped hay or straw well wetted down.—R. W. Thatcher, Iowa University Farm.

Field Notes from the Live Stock Men

Alex McDonald, who put California on the map as the feeder of grand champion steers at the Chicago International last year, is fitting a bunch of show stuff at the Davis farm to exhibit at the fairs this fall. Hopeful the Gibson estate and is planning improvements on the place and later on the addition of more cattle to the herd.

The Glide Shorthorns will be out on the circuit again this year and the string will capture plenty of ribbons in

Grades, but Good Ones Just the Same

Jersey cows on the A. J. and Nellie A. Morey Ranch, Orland. Cow in foreground headed Orland Cow Testing Association for month of October with record of 59.3 pounds fat.

Prince 2nd, who sired the prize winners last year, is being carried along on straight pasture and is in fine breeding shape. He is considered one of the finest bulls of the breed in the West.

Roselawn Shorthorns in Yolo County are in fine fettle, but their usual large show herd will be small by comparison this year because they have sold down pretty close. Carl Johnson, the herdsman who has been handling the old Tom Gibson herd for years, is still at the helm, and depend upon him to trot out something good when the judge calls for the beef classes. Dr. Elberg has taken a long lease on

the different classes. The two-year-old Cumberland-Villager bred red bull Mr. Glide purchased from the Sanders herd in Iowa, is looking fine and will attract a lot of attention at the fair. Wm. Gibson, the herdsman, will have the Hillcrest stuff ready when the bell rings. Hillcrest Mary, a Glide bred heifer, is going to take a lot of beating. A junior yearling red heifer, daughter of Lancaster King, will be up there too. The class in which she will show will represent the greatest line-up of young stuff ever seen in the West in one ring this year, as there are a number of possible champions in the lot.

Organization of Hereford Breeders

Active work in developing the industry of raising Hereford cattle on the Pacific Coast is to be prosecuted by the new Pacific Coast Hereford Cattle Breeders Association, organized at a recent meeting of the leading Hereford breeders of the state, held at the University of California Farm at Davis. The officers are: H. H. Gable of Esparto, president; W. D. Duke of Likely, vice-president; W. R. Madden of Dixon, secretary-treasurer. Besides promoting better acquaintance and cooperation among the breeders of Herefords, the association will hold public sales and promote exhibits at state and county fairs.

The possibilities of Hereford breeding in California are illustrated by the fact that the University of California farm has just sold for \$1000 (a record price for a California-bred Hereford calf) a three-months-old Hereford bull calf bred at the university farm. The buyer is John A. Bunting of Centerville. For the dam of this calf, Sophie, a 1700-pound cow, the university paid \$250, and for his paternal grandsire, \$400. The sire was "Hopeful Prince," a half-brother to the steer with which the University of California recently won the grand championship at the International Livestock Show.

Buy Feed

Cheap feed will be a rarity this year and yet the temptation may be strong to hold off buying until more satisfactory prices can be had than today. During the late fall and early winter season many hog feeders ran short of grain. This meant lots of soft stock going to market at comparatively low prices. The wise stock feeder should take advantage of every possible condition and lay in a supply of feeds. New grain is now coming to market and the feeder, by keeping his eye open, watching as to quality of different grains, and prices as well, may be able to put in an adequate supply for this season's feeding. Bar-

ley is comparatively reasonable at this time. It may be lower but all grain buyers are not united on this point. In any case let the feeder get wise and secure a good supply before abnormal advances are made.

**KEEP HOG CHOLERA AWAY**

The Imperial County hog growers are posting the following:

**NOTICE**

The hogs on these premises are free from cholera. Owners of infected herds are

**Warned to Keep Away**

No visitors allowed in hog pens or fields without permission. Trespassers will be prosecuted to the full extent of the law.

# Get Rid of Worms!

Many animals, especially hogs, are troubled with worms. When your hogs are unthrifty, you hear a little cough now and then, suspect worms.

## Dr. Hess Stock Tonic

**Keeps Hogs Healthy**      **Expels Worms**

So sure am I that Dr. Hess Stock Tonic will keep your hogs healthy and expel the worms, that I have authorized my dealer in your town to supply you with enough Tonic for your hogs and, if it does not do all I claim, just return the empty packages and get your money back.

My Stock Tonic is not a feed, but a true conditioner and tonic, highly concentrated, which contains blood purifiers, laxatives and drugs which are powerful worm expellers. Feed in small quantities, watch your hogs improve.

**NEVER PEDDLED. SOLD ONLY BY DEALERS.**  
28,000 reliable dealers in U. S. handle it. Why pay the peddler twice my price?

**25-lb. Pall, \$2.25; 100-lb. Sack, \$7.00**

Smaller packages as low as 65c. Valuable stock book mailed free, if you write for it.

**DR. HESS & CLARK, Ashland, Ohio**

### Dr. Hess Poultry Pan-a-cé-a

conditions fowls, makes hens lay and is a great help at moulting time. Valuable for chicks, for pullets starting to lay and for all grown fowls. Costs a penny for 30 fowls per day. 1½ lbs., 25c; 3 lbs., 50c; 7 lbs., \$1.00; 25-lb. pall, \$3.00. Guaranteed.

### Dr. Hess Instant Louse Killer

A reliable lice killer, very quick acting. For use on poultry and stock. Use by dusting and sprinkling. Destroys bugs on cucumber vines, cabbage worms, slugs on roses. In handy sifting-top cans. 1 lb., 25c; 3 lbs., 60c. Guaranteed.

Write Dr. Hess about any sick animal or live stock trouble, enclosing 2c stamp. He will advise you free.

## Poland Chinas, Medium Type

Choice breeding stock, both sexes, from Panama-Pacific International Exposition prize winning strain. 12 firsts, Junior Champion and Reserve Grand Champion Boar. Junior and Senior and Grand Champion Sows. \$2145 cash awards. Write to

**M. Bassett**  
Hanford, Kings County, Cal.

## ABORTION IN CATTLE

**PREVENTED AND CURED PERMANENTLY**  
**YOUR COWS MADE PROMPT, REGULAR BREEDERS BY**  
**STERILOID**

**STOP LOSING CALVES**

**TREATMENT:** If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

**GUARANTEE:** We will refund money in every case when STERILOID FAILS to make good. Price \$1.00. Mail postpaid, in plain wrapper.

## Care of Growing Chicks During Warm Weather

**C**ARE of growing chicks during the summer is one of the most important factors in poultry raising. The chicks may be hatched from strong, vigorous stock and carefully brooded, but unless they receive the proper attention during the warm months their

growth may be retarded. In other words, they should be so managed that they will mature into well developed fowls.

### Proper Housing

Growing chicks should be provided with a house that will give them a place to stay in bad weather and at night. No particular style of house is recommended, but it should be so built that it will provide the chicks with ample ventilation, dryness, sunlight, freedom from drafts, and be so arranged that it can be cleaned easily and frequently.

Care should be taken not to crowd the chicks by placing too many in any one house. When the chickens cover the greater part of the floor at night, it is an indication that they are too crowded. At such a time they should be thinned out and placed in another house.

### Feed and Water

In addition to the grain feed that the chicks are likely to find when on free range, a grain mixture should be given morning and evening. The following rations should produce good results:

Equal parts of cracked corn and wheat. As the chicks increase in size, oats may be added. To cheapen this ration it may be changed to two parts cracked corn and one part wheat. When one part of oats is added to this mixture, as the chicks increase in size, the ration may be changed to three parts cracked corn, one part wheat, and one part oats.

In addition to the above a dry mash should be fed in a hopper to which the chicks have access at all times. The following mixtures are suggested:

Two pounds corn meal, one pound middlings, four pounds oat meal, two pounds wheat bran, two and one-half pounds beef scrap.

Two pounds corn meal, one pound middlings, two pounds wheat bran, two and one-half pounds beef scrap.

Three pounds wheat bran, three pounds middlings, three pounds corn meal, one pound crushed oats, one and one-half pounds beef scrap.

Charcoal, grit, and oyster shell should be provided so that the chicks can help themselves whenever they want to.

If a continued supply of sour milk can be obtained it may be fed separately and the beef scrap in the above rations reduced one-half. Sour and sweet milk should not be fed alternately as such practice is likely to cause bowel trouble. Whenever it is possible growing chicks should be allowed free range so they may obtain as much natural green feed as they need in addition to bugs and worms. When green feed can not be obtained on range such feed as sprouted oats, cut clover, mangle-

wurzel beets, etc., should be fed daily.

The importance of clean fresh water for chicks can not be overemphasized. In very hot weather fresh

water should be given to them twice a day. Whenever possible the pan of water should be placed in the shade to keep cool. The water pan should be cleaned every day before fresh water is added.

## Oats to the Rescue

Written for California Cultivator By Nettie Metcalf

**T**HE cry of the multitude of poultrymen right now is in protest against the high price of feed.

It will be found that oats will help out wonderfully, and when chicks are half grown oats should form a good share of their diet, if large frames are desired, on account of the bone framing material contained in them.

Sometimes I pour scalding water over them at night, to soften the hull and swell the grain, leaving them covered until morning, but usually I feed just plain dry oats in the morning and follow up with beet or other greens to pick at during the day, and when all other greens are scarce, I have found that oats can be sprouted in a short time. Instead of putting the grain to be sprouted into boxes as we used to do, I now dig up a place in the poultry yard, wet well, and sow thickly to oats. I have a frame about 3 feet square and 10 inches high, just four boards nailed together, (6 inch boards would do nicely). This I put over my bed of oats and over this a frame of screen wire, upon which I can throw bagging for shade. I sprinkle thoroughly and often and am rewarded by a luscious crop of green in a few days, when another bed is prepared and the frame moved to that. This process also keeps the yards sweet, as the growing grain purifies the ground. The deeper you work the

soil under the frames the better the crop will be and the longer it will last. Let the oats grow until 4 to 6 inches high before taking the frame away and if a piece of wire netting is put over the greens to prevent the roots being dug out the patch will last longer, but it won't last long. Barley will grow almost as well as the oats.

Now while there is some complaint that the increase in the price of eggs and poultry is not equal to the advanced cost of production, we used to have an old saying that "Dear feed makes cheap cattle" which applies to the present condition very aptly; so many people selling off and reducing their flocks, thus flooding the market and bringing down the prices, but just wait, the pendulum is going to swing the other way before long, and what with these depleted flocks and the new crops of grain coming in, there will be such a demand for a stock of eggs another season that those who can and do hold on will surely reap their reward.

And the hens cackle on undisturbed by the high cost of living knowing they are "doing their bit" every day of their lives. I do not know of a single flock that is not holding its own, and most of them are paying a small profit, even now; not all that the work of caring for them should bring, but few forms of business are paying as well as they should just now.

## American Egg Laying Contest

By T. E. Quisenberry

**L**EGHORNS and smaller breeds in the American Egg Laying Contest at Leavenworth, Kansas, showed quite an increase in egg production for June. Eight out of the ten highest pens for June were Leghorns. The third highest pen for the month was a pen of Black Rhinelanders. While the larger breeds were broody in June, the smaller varieties kept busy.

The ten highest pens of five pullets each for June were as follows: Single Comb White Leghorns, Illinois, 119 eggs; Single Comb White Leghorns, Missouri, 110; Black Rhinelanders, California, 107; Single Comb White Leghorns, Illinois, 107; Single Comb White Leghorns, Missouri, 106; Single Comb White Leghorns, Illinois, 105; Single Comb White Leghorns, Nebraska, 104; Single Comb White Leghorns, Kansas, 104; White Wyandottes, Illinois, 103; Single Comb White Leghorns, Wisconsin, 102.

A Barred Rock from Missouri and a Black Rhineland from California

have tied for first place as an individual. One hundred and seventeen pullets have laid over 120 eggs each in eight months, which entitled them to be registered. Over half the pullets will pass this mark for the year. The ten highest individuals to date are as follows: Black Rhinelanders, California, 189 eggs; Barred Rock, Missouri, 189; White Wyandotte, Arkansas, 178; White Wyandotte, Arkansas, 171; White Orpington, Missouri, 170; White Wyandotte, Illinois, 163; Barred Rock, Kansas, 162; Barred Rock, Missouri, 160; White Wyandotte, Illinois, 159; White Wyandotte, Illinois, 157.

White Wyandottes and Barred Rocks have tied for the eight months period. The ten highest pens to date are as follows: Barred Plymouth Rocks, Missouri, 730 eggs; White Wyandottes, Illinois, 730; White Wyandottes, Arkansas, 697; Single Comb White Leghorns, Pa., 662; Single Comb White Leghorns, Missouri, 660; Black Rhinelanders, California, 653; Barred Plymouth Rocks, Kansas, 630; White Wyandottes, Illinois, 611; Barred Plymouth Rocks, Maine, 600; Single Comb Rhode Island Whites, Michigan, 598.

### POULTRY

Day Old Chix—Barred Rocks, Rhode Island Reds, Black Minorcas, Brown Leghorns, Buff and White Orpingtons. Other popular breeds a matter of correspondence. Enoch Crews, Seabright, Calif.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., 607 E. Third St., Los Angeles, Cal.

200-290 Egg Leghorn, Wyandottes, Rocks, Reds, Anconas, Orpingtons, pullets, cockerels, breeders. August half price sale. Money-makers. C. Beeson, Pasadena, Calif.

"Eastman's Bred-to-Lay" Barred Plymouth Rocks, August chicks and eggs. Fairmead Poultry Farm, Fairmead, Cal.

### PATENT ATTORNEYS

Patents that protect are secured through The PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "PATENTS."

### HOGS

Chester Whites, the Billiken Brand.—Your duty is to raise more hogs and increase the meat supply. The demand for pork exceeds the production. Get started with some of these Chesters; 3 bred sows farrowed in April, 1916, due to farrow in September, and October; 18 October gilts bred to farrow in October; 3 October boars ready for service. All first class in every respect and good enough to fit and show at the different fairs this fall. All are cholera immune and will be registered free. Write for price list and booklet. C. B. Cunningham, Box C, Mills, California.

Grape-Wild Farm Berkshires—World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Large Yorkshires—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

Superba, World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

Rancho Rubio Durocs—Only a few September gilts left. One corking good fall boar by Orion Model, son of the last International grand champion. Place your orders now for weaned boar pigs. Best I ever raised. Elmer Lamb, Ceres, Cal.

Wanted—Farmers, orchardists, livestockmen to use classified liner advertisements like this. Thousands of people read every ad and the cost is only 3 cents per word per issue, minimum 35 cents. Extra lines of white space above and below cost only 16 cents per line.

Choice Berkshires—We are overstocked with young hogs, boars and gilts by Artful Duke 32nd, Rancho Otto and Ames Rival 131st from prize winning sows. We are offering some fine bargains to early comers. Hollow-Hill Farm, Colton, Calif.

Biggest Prize Package Yet—Three brood sows, eight months old and one herd-boar eighteen months old. All best I. O. C. breeding. \$180 takes the lot. G. H. DuBois, San Martin, Calif.

Big Type Durocs. Well grown out February and March pigs of either sex in any quantity. We ship only the tops and butcher the culls. F. M. Johnson, Napa, Cal.

Cholera Immune Duroc-Jerseys. Big type. Weaned boars and gilts from 500 to 700-pound sows. Prize winning stock. Derryfield Farm, I.O.O.F. Temple, Sacramento.

Choice Boar Pigs for Sale—Sired by Superba 220620, champion Poland boar at San Francisco. Prices right. C. R. Hanna, Riverside, Cal.

Poland-China Swine Recorded. Stock for sale at all times. We please you or refund your money. W. A. Young, Lodi, Cal.

Most Money in Duroc-Jerseys. Bred sows and weanlings, either sex all the time. Delta Farm and Live Stock Co., Colton, Cal.

One Large and two medium type boars extra choice, 9 and 10 months old. W. Bernstein Ranch, L. C. Trehwitt, Mgr., Hanford, Cal.

Large Yorkshires—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

Duroc-Jerseys—Few choice March males from best eastern stock. Reasonable prices. W. M. Taylor, R. D. No. 1, San Bernardino.

Large Type Poland Chinas are prolific and profitable. Can furnish boars any age at reasonable price. J. A. Crawshaw, Hanford, Calif.

Model Herd Berkshires bred for size and quality. Weanlings and gilts. J. L. Gish, Laws, Calif.

Carruthers' Farm Berkshire Hogs. Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

Duroc-Jerseys—Headquarters in the west for Golden Models. Peters, Lamson & Walker, Devore, San Bernardino County.

Berkshires—Two hundred pounds at six months. Ray C. Hannan, Corning, Cal.

Poland-Chinas—A few good breeding boars. S. F. Williams, Orland, Cal.

### AGRICULTURAL IMPLEMENTS

Large Assortment slightly used and agents' sample plows, harrows, cultivators, wagons. Call and see them before buying. Save 50 per cent on some Four floors. Largest stock. Arnott & Company, Ranchers' Supply House, 112 to 118 South Los Angeles St., Los Angeles.

### HORTICULTURAL PRINTING

Catalogues—Good Printing. Specialists in preparing nursery, seed, poultry and live stock catalogues and all kinds of commercial printing. For prices and information address WOLFER PRINTING Co., 424 Wall St., Los Angeles.

### LIVE STOCK

On the Lawrence ranch, two miles northwest of Modesto, Wednesday, August 8, 1917, I will sell the following live stock: 33 good dairy cows, 17 Holsteins and 16 Jersey and Durham; 8 Holstein calves; 1 registered Holstein bull two years old, 17 extra choice brood sows, all due to farrow by the 12th of October; two herd boars, all pure bred Durocs. Registration papers furnished with each hog. One expert stock horse and saddle.

Lease expires on the Lawrence ranch, reason for selling.

Terms of sale: Credit of six months will be given purchaser on approved notes, without interest, if paid when due; seven per cent from date if not paid when due. No discount for cash.

Come everybody—you are welcome. Ladies especially invited. R. J. Ross, owner; Frank Hatch, clerk. Col. Cy N. Clark, Modesto, auctioneer.

D. E. Kellner, importer and breeder of Hampshire sheep, Eugene, Cal., offers for sale a choice lot of Hampshire ram lambs, sired by Walnut Hill and Butterfield Rams, purchased at Salt Lake, August, 1916. Lambs ready for delivery after July 15th, 1917. Inspection and correspondence invited.

Butte City Shorthorns, Shropshires, Berkshires and Ponies. Stock of all ages for sale. Can supply one or a carload. Get our prices and descriptions before buying. Butte City Ranch, Box C, Butte City, Glenn Co., Cal.

At Last the Perfect Silo—the Stay Round. No hoops, no bolts. No experiments. Any one can erect. Close price. Address D. O. Lively, 215 Hobart Bldg., San Francisco.

For Sale—100 good young dairy cows and heifers, 25 calves, 150 hogs, pigs, Percheron stallion, year-old jack. Want to lease pasture near Madera. A. H. Tilton, R. D. Box 164, Madera.

Registered Shires—Blackhawk Stock Ranch. Importers and Breeders. Easton & Ward, Burlingame, Cal.

For Sale—3 light driving and riding mares and one pony. Hollow-Hill Farm, Colton, Calif.

Goats—One Saanen buck, two does. Bargain. C. A. Newton, Corona, R.D.No. 1.

### CATTLE

Holstein Herd for sale: Herd consists of seven females and five bulls, including a splendid cow, her four daughters and a grand daughter, all registered stock of good breeding. Priced for quick sale. P. A. Hogaboom, Route A, Fair Oaks, Cal.

D. O. Lively Stock Farm, Inc., 215 Hobart Bldg., San Francisco. Breeders of Hereford cattle. A few choice heifers for sale. We buy and sell live stock on commission. Farm at Mayfield, Cal.

Registered Holsteins out of ARO Dams. Grandsons of Pieterje Malt Ormsby, 35.55 pounds average 5.31. Geo. Kounias, Modesto Farms, Modesto, Cal.

Venadera Jerseys, the herd with official yearly records. Calves of both sexes for sale. Guy H. Miller, Route 1, Modesto, Cal.

Thirty high-grade Holstein Cows and one registered Holstein bull. Chas. Hubbard, Riverdale, Calif.

Young Holstein Bulls, bred right, grown right, priced right. Creamcup Herd. M. Holdridge, Modesto, Calif.

N. H. Locke Co., Lockford, Cal.—Choice young Jersey bulls for sale.

Holstein Bulls from record cows. Prices right. A. M. Bibens, Modesto, Calif.

### MACHINERY

WHY BUY NEW? SAVE HALF. Material guaranteed. It's second hand after used few times, but not worn out.

Let the wind do it. 8-ft., \$27.50; 10, \$35; 12, \$55; 16-ft. mills, \$125; cost new \$235. Pump as much as a h. engine for nothing once installed. Why buy gas?

### TANKS—TANKS

New, used tanks, guaranteed: 1500-gal. galv. with cover, \$25; 16,000, \$250; 10,000 redwood, \$75; 10,000 fine heavy galv. tank, \$135; SOME TANK. Big 100,000 gal. redwood storage tank, round lug hoops, cost \$1200, our price \$400 before we move. Has mile of lug hoops alone, cost over \$600, also has low stand. Be quick. See who's cheapest.

### ENGINES, PUMPS, PIPE

Centrifugal pumps; plunger pumps, \$5 up; Big Bulldozer single acting jacks, \$68; double-acting No. 30 Ames, \$350; cost \$1000; 2 1/2 hor. 2 step centrifugal pump, \$40; large Addison double-acting plunger pump complete with 35-ft. 10-in. pipe, 9-in. well brass cylinder, double rods, pumps 50 in.; outfit cost \$1500; snap at \$475; 9-h. p. Foss, \$135; 8-h. 12 Fairbanks, \$165; 6-h. Stearns, \$99; 2-h. Fairbanks with direct connected walking beam pump jack, cost \$125 new; our price \$68. Many other first class engines very cheap.

Brass cylinders, Plunger rods, pipe. Fittings, Ranch Machinery, Sundries. Fine, 2-gang mouldboard plow, \$45; 3 or 4-gang disc tractor plow; alfalfa renovator, \$25; 24-disc, 4-horse harrow, \$38; mowers, buck rake, feed cutter, \$8.50; bone grinders, \$6 to \$12; feed mill, \$10.50; water trough, \$4; cement mixer, \$25; sprayer, \$19.50; new discs, \$1 each; 68 ft. 8-in. rubber belt, half price.

Wanted to buy first class material. No junk wanted. Pioneers in our line. DEMMITT CO., Office Upstairs, 120 N. Main. Yards, 816 Yale, Los Angeles.

For Sale—Pumping plant, 25 h. p. Commercial engine. No. 5 Krogh pump, belt, shafting, drums, tanks, etc. Ready to start work. Price \$300.00. Ward N. Fancher, Indio, Calif.

Several new and slightly used engines at a bargain. Best makes. 1 to 35 h.p. Arnott & Company, Wholesale Machinery and Implements, 112 South Los Angeles St., Los Angeles, Cal.

### LUMBER

Lumber—Sash—Doors—Plumbing Supplies—Building Materials of all kinds, new and 2nd hand. \*A.R.W. Shingles 50c per bundle. Send list for estimate. Dan P. Dolan, 1670 Mission Street, San Francisco, Cal.

### MISCELLANEOUS

For Sale—575 two-gallon orchard heaters if taken soon 10c each. One 5,000 gallon galvanized iron tank. One 250 gal. galvanized iron tank, about 3500 gallons of Star fuel oil. Inquire of J. Earl Talcott, Anaheim, Calif.

To Fruit Growers—New simple process for crystallizing figs and all other fruits. Instructions, terms, on application. Correspondence with fruit growers solicited. Monteith & Co., Santa Rosa, California.

Slacked Lime—Send for sample and information. Price right. Let me help you. H. B. Matthews, 350 Woodberry Road Pasadena.

For Sale—Ice box suitable for store, hotel or dairy, galvanized lined, capacity 900 lbs. ice. Hollow-Hill Farm, R. F. D. No. 1, Colton, Calif.

To Reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

Send One Dime, receive 25 cent cake best skin and scalp soap, postpaid. Healing Soap Co., 1704 Oregon St., Berkeley, Cal.

### RABBITS

Raise Rabbits For Us—We sell you foundation stock and buy back what you raise, paying \$1.75 and \$2.00 each for them. Send 25c for our proposition, our book on rabbit culture and our supply catalog. Gilmore's Rabbit Farm, Dept. C, Santa Barbara, Cal. (The rabbit farm of international reputation.)

"The Western Rabbit Book" containing everything pertaining to the rabbit business. 15 chapters, illustrated. Price 50c. Mrs. C. A. Richey, 616 N. Benton Way, Los Angeles, Calif.

### MOTOR CARS IN THE UNITED STATES

In 1916 there were 1,067,332 more motor cars registered in the United States than in 1915. This was an increase of 43 per cent. The gross total of registered cars, including commercial cars, was 3,512,996; the number of motorcycles registered was 250,820. The several states collected in registration and license fees, including those of chauffeurs and operators, a total gross revenue of \$25,865,369.75. Of this amount 92 per cent, or \$23,910,811, was applied directly to construction, improvement, or maintenance of the public roads in 43 states, according to figures compiled by the Office of Public Roads of the United States Department of Agriculture, in Circular 73, "Automobile Registrations, Licenses and Revenues in the United States, 1916."

The figures for 1916 correspond very closely with the annual percentage increase of motor car registration of the last three years. This yearly increase has averaged 40 per cent in the number of cars and 50 per cent in revenues.

When viewed over a period of years, the increase in motor-car registration and gross revenue has been remarkable. In 1906 the total state registrations were approximately 48,000 cars, on account of which the several States collected in fees and licenses a total gross revenue of about \$190,000. Only a small part of this was applied to road work. In 1916 the \$25,865,369.75 collected formed nearly 9 per cent of the total rural road and bridge revenues of the states.

Recent years have shown an increasing tendency to put the spending of the motor-car revenues directly in the hands of the state highway departments. Of the total amount applied to road work in 1916, 70 per cent, or \$16,411,520, was expended more or less directly under the control or supervision of state highway departments. Only 13 states did not exercise any direct control over the expending of the net automobile revenues.

### POULTRY AND PET STOCK SHOW

Plans are now being made for the annual poultry, cat, dog, rabbit and pet stock show to be held at San Jose in October. It will be held under the auspices of the Santa Clara Valley Poultry Association, the Garden City Kennel Club, the California Pet Stock Association, and the Pacific Pet Stock Association. Arrangements are being made also to make the American Red Star Animal relief the beneficiary of the show.

## The Cultivator Patterns

8423

8408

8411

8409

8430

8180

8423—Children's Rompers. Cut in sizes 2, 4 and 6 years. Kimono waist is in one piece with short sleeves.

8169—Ladies' Russian Blouse. Cut in sizes 34 to 42 inches bust measure. Jersey cloth, satin, silk or crepe can be used for this blouse.

8408—Ladies' Shirtwaist. Cut in sizes 36 to 42 inches bust measure. The waist has a detachable collar and long or short sleeves.

8430—Ladies' Dress. Cut in sizes 36 to 42 inches bust measure. Long or short sleeves may be used and the skirt is cut in one piece.

8411—Ladies' Dress. Cut in sizes 36 to 44 inches bust measure. The dress has a two-piece, gathered skirt.

8180—Children's Dress. Cut in sizes 2, 4, 6 and 8 years. The waist is plain and the skirt is cut in one piece.

8409—Ladies' Skirt. Cut in sizes 24 to 32 inches waist measure. The skirt is cut in two pieces.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address:

### THE FLAG OF THE U. S. A.

By E. A. Brininstool in Wells-Fargo Messenger

Against the sky it is fluttering high,  
In the winds of a tropic breeze;  
It swings and dips from the great gray ships

That buffet the foaming seas.  
It backs the guns of the Yankee sons,  
As its rippling colors sway  
To the marching feet down the dusty street—

The Flag of the U. S. A.

It flutters free on the land and sea,  
With its Red and its White and Blue;

Wherever it goes against its foes,  
'Tis followed by soldiers true.  
To the rattling thrum of the throbbing drum,

It gleams in the battle's fray.  
And never, as yet, has its match been met—

The Flag of the U. S. A.

It waves and runs with the frowning guns,  
No matter in war or peace;  
Midst the cannon's cry it will bravely fly

Till the sounds of the conflict cease.  
With its filmy stars and its blood-bought bars,

Men follow it day by day,  
And die to defend to the final end—

The Flag of the U. S. A.

Through the battle's blast, from the staff or mast,

Does the Starry Emblem wave;  
It sings a tune in a gentle croon,  
O'er the martyred soldier's grave.  
It swings aloft in the breezes soft,  
In a quivering, peaceful way,  
That banner fair and without compare—

The Flag of the U. S. A.

Through the shot and shell of seething hell,

Where the crash of war is heard,  
It grimly waves o'er its gallant braves  
With a glory yet unblurred.  
It leads the van of the fighting clan,  
When raised, it is up to stay!

For by never a foe shall it be trailed low—

The Flag of the U. S. A.

### FROM AN AIRPLANE

With nearly a billion dollars appropriated to send flyers over Germany there is keenest interest in the questions which aviators have to consider. One of the most interesting statements we have seen on this line, and from a scientific standpoint, is that of Ford A. Carpenter, meteorologist of the weather bureau of the department of agriculture, and local forecaster for the Los Angeles district. The close cooperation between the weather bureau and the aviator is indicated by Dr. Carpenter in "The Aviator and the Weather Bureau," published by permission of the Weather Bureau by the San Diego Chamber of Commerce. Dr. Carpenter says: "In order to qualify as meteorologist competent to confer with aviators, it seemed desirable to become personally acquainted with some of the conditions that confronted them." Therefore, he put himself in the student's place and learned at first hand the practical facts by weather observation up where the weather is made. He sought to determine the height of the upward trend of the sea breeze over Point Loma, also to observe the extent, form and condition of the velo cloud which is the characteristic sun cover of California, and other lessons. From Dr. Carpenter's story we quote:

VIATOR Inspector Oscar Brindley (the 1915 winner of the Curtiss trophy), in military tractor No. 50, was assigned as pilot. It may be stated here that the accepted definition of aviator is a pilot of a flying machine heavier than air. The airplane used in my first flight was made in Los Angeles and is the present standard army model. This tractor has an 80-horsepower engine and 8-foot propeller. It is 21 feet long, has a wing-spread of 38 feet, supporting area 364 square feet, and a flying radius, with two persons, of 300 miles. The maximum altitude attained with this model at San Diego was 13,000 feet. Before being placed in service the machines are thoroughly gone over at the repair shop, and the motors are run at full speed for 24 hours, after

which they are taken down and subjected to scrutiny for possible defects. All of the struts, guys, and wires are closely examined; the boltheads are all drilled, wired, and soldered so that no amount of vibration will loosen them. Regardless of the length of the flight, each machine, before going up again, is given a rigid inspection and not until the mechanics have tested every part is it pronounced ready.

Not being prepared with a regulation aviation suit, I was loaned a leather jacket by one officer, face-goggles and safety helmet by others. I then took my place in the observer's seat forward and was strapped into it with the safety belt. I was cautioned to let my body give way as the waist-controls were moved from side to side and not pay any attention to the steering rudder wheel which had a way of mysteriously revolving, advancing and receding.

In cranking an airplane, a certain formula is always gone through. The mechanic at the propeller calls out, "Closed!" The aviator closes the switch and repeats the word. This short-circuits the ignition apparatus so that no spark occurs in the cylinders. The propeller is turned in order to introduce explosive mixtures into the cylinders. When ready to start the mechanic says "Open!" The aviator opens the switch and repeats the word. The charges in the cylinders then fire when the propeller is turned.

After the engine starts, the machine is "timmed" by helpers and jockeyed for a favorable "take-off" into the air. This model of airplane climbs on a gradient 1 to 7; its minimum speed is 41 miles per hour. In other words, if the speed is less than 41 miles per hour the machine will not fly horizontally.

### The Ascent

The tractor was headed into a 30-mile northwesterly wind so that the "take-off" was quick and easy; there were only a few seconds spent rolling over the field, when the airplane left the ground and I felt the never to be forgotten cushioning feeling of the air. For ten seconds there was experienced a decidedly weakening nervous chill, which occurred to me once before when making a high dive from a spring-board. It was the sort of physiological disturbance that can only be counteracted by immediately pulling one's self together saying, "Well, here goes nothing!" The momentary depression was immediately followed by a corresponding elation of feeling which strange to say did not leave me during the trip and is always associated with thoughts of the journey. There was no dizziness, although I am peculiarly susceptible to the least change in balance. The earth did not recede as we progressed steadily upward; we seemed part of the earth, but not of it. Although the airplane reached an altitude of 3000 feet in a comparatively few minutes, the barometer falling from 30.0 to 27.0 inches, the decreased bodily pressure was not at all noticeable.

Next to the supporting quality of the atmosphere I had noticed the 70-mile blast of air as the airplane pushed its way steadily onward and upward. Naturally, the exhaust of the motor in addition to the roar of the wind made conversation impossible. Some airplanes have telephone communication between observer and pilot. During one flight in a machine

not so equipped, the passenger noticed the breaking of some apparatus. Knowing that it was impossible to make himself heard he hastily scribbled the word "Accident!" on a bit of card, whereupon the pilot shut off his engine and glided to earth.

### Two Thousand Feet Above Point Loma

Carrying out my suggestion as to investigating the "woolly," the pilot drove the machine straight for Point Loma and those unseen aerial breakers. Suddenly there were two distinct "wallops" and I felt the fuselage, beneath me respond as if struck by a stuffed club. There was evidently first a surge then a drop, and it was the descending current of air that deprived the airplane of the supporting medium, hence the shock. Point Loma itself, from this altitude, and seen directly from above, looked very like a barracuda's backbone—long, low, and ugly. Although this peninsula is less than 500 feet high it so effectively deflects the prevailing northwesterly wind that the upward surge has been noticed by aviators at an altitude of 4000 feet. It is no wonder then that these descending winds, called "woolies" (from their churning the water into isolated masses which look like tufts of wool), are dreaded alike by yachtsmen and birdmen. They have been known to carry away topsails from too closely venturing schooners and student aviators always give the vicinity of Point Loma a wide berth.

### No Winds Aloft

We had not changed our direction since leaving the ground, but after passing over Point Loma the airplane was put sharply on a port course. I had been expecting this and must confess, somewhat dreaded it, innocently thinking that a 30-mile wind added to our 70-mile rate of speed would "heel" the craft to an uncomfortable angle when the course was changed from

northwesterly to southerly. What was my astonishment to find that the putting about was unaccompanied by any of the nautical motions such as tilting or canting. Theoretically one may be ever so well grounded in physical laws but it seems to take actual experience to bring their truth home to us. Of course there can be no wind in the air; when we entered the air it was moving 30 miles an hour in relation to the earth but as soon as we were free from the earth the velocity of the wind had no effect on our flight. No matter how strong the gale, so far as it concerned the airplane, if the wind be steady no difficulty is experienced; the aviator is concerned only by wind-shifts.

#### The Velo Cloud Seen from Above

In kindergarten days I remember that one of the first questions I asked was "Are clouds smoke?" And this early query was really first answered in the air. Fog on a mountain top may be cloud, but somehow cloud free from close proximity to the earth seems different.

The machine was put through the cloud blanket much as a horse takes a hurdle; it seemed unlike fog and more of a palpable substance. As we emerged, the sun was shining on it like a silvery sea with gently undulating surfaces and it looked for all the world as supportable as layers of cotton-wool. Many times have cloud-banks from mountain tops been observed, yet the upper side of the velo cloud from a flying-machine looked very different. The cloud was only four or five hundred feet thick and extended inland a few miles in irregular outline. The seaward edges of the velo cloud were not ragged, and apparently paralleled the coast for 10 to 15 miles.

Such was the exhilaration and confidence the air gave that I can understand how parachute jumpers confidently step off into space, for to them the air is a supporting medium no more terrible than a transparent sea to a good swimmer. I believe that the record parachute drop was made in 1916 by Colonel Maitland, of the English Royal Flying Corps, who descended in a parachute 10,000 feet from an airplane. Fifteen minutes was occupied in the descent.

#### Ease of Vision at 3500 Feet Altitude

At this altitude the ease of vision is most remarkable. At this height, with perpendicular vision, the eye is possessed of wonderful powers. In those "solitudes august with stars" men not only "mount up with wings as eagles" but are given the eagle's unobstructed vision. Birds have been credited with much too keen vision. From this height of several thousand feet every object stood out with remarkable distinctness. Automobiles racing along the El Cajon boulevard to Lakeside were readily picked up with the unaided eye although 20 miles away. Looking down over the aviation field the long compass mark and the wind-direction pennant were easily distinguished. The bay and ocean, however, gave the most remarkable revelation, for the bottom of the bay and the shallow ocean shore were plainly discernible. The absence of water as well as air refraction explains why submarines cannot hide from the airplane: one of the army aviators told me that a submarine cannot ordinarily sink so low that it cannot be seen from an airplane.

#### Color of Landing Ground Important

Owing to the absorption and reflection of sunlight, there is a distinct variation in the character of otherwise similar landing ground. A field,

dark from recent plowing (or burning), will heat the air over it faster than will a field of stubble, hence over the former field there will be the greater air disturbance, and this will affect the ease of landing. Air is heated by contact and convection. One of the aviators said that recently he was descending, and had all but reached the ground when a localized convectional current hurled his machine upward some distance but immediately afterward deposited him on the ground without damage.

#### Spiraling Down 3000 Feet

Speeding ever in wide circles the course lay southeast over the upper part of San Diego Bay. The city of San Diego presented the usual check-board appearance, and even at this altitude it would seem easy to drop an orange at almost any point. The velo cloud was lifting and we could see the gradual disappearance as it melted rather than drifted from North Island.

The gliding descent was made from an altitude of 2500 feet, starting above San Diego. As the aviation school was approached, we could see a number of machines in the air, three below and two above us, circling about like hawks. And, like soaring birds, these machines had their air-lanes, designated courses and levels being devoted to the different classes of machines. The landing was made without incident and the hour's flight was ended.

#### TO CAN SWEET CORN

Can as soon after the corn is gathered as possible. Remove husks and silk. Blanch by placing in boiling water for five minutes. Remove and dip quickly into and out of cold water. Cut the corn from the cob and pack directly into hot jars or cans to within one-fourth inch of the top. Pour in enough boiling water to fill the container. Add one level teaspoon of salt to each quart. Put rubber rings and caps of jars into position, but do not tighten the wire clamps. Seal tin cans completely.

Place containers on a false bottom of wooden slats or wire mesh in a vessel of water deep enough to cover the containers completely. Keep the water boiling for three hours.

Remove the jars, tighten covers, invert jars to test seal, and cool (not in draft as jars might crack).

Tin cans may be placed in cold water for rapid cooling.

After the containers are cool store in a dark, cool place.

Rapid preparation for canning is especially desirable for corn if a good quality of product is to be obtained. The best results can be secured when one person cuts the corn from the cob and another fills the containers. If it is necessary for one person to work alone she should cut off sufficient corn to fill one jar, pour on boiling water, add salt, place the rubbers and caps in position, and put the jar or container into hot water at once. The extra cooking which will be given to the cans filled will not be injurious and a better product will be secured than if the cut corn were allowed to stand until all jars were filled.

#### MAKING POTATO STARCH

The Sacramento Bee is authority for the following simple method of making potato starch. It might be worth trying.

"Potato starch is easy to make. Potatoes or potato peelings may be grated or ground in an ordinary food chopper and then washed in clean water. The starch particles become suspended in the water and after the coarse material is removed, will settle to the bottom. To make the starch perfectly clean, the water with the starch particles suspended in it may be run through a cloth filter.

"The uses of potato starch are many. It may be used in the making of bread and gives a fine texture to all sorts of pastry. Steude says the war bread of Germany contains two-thirds other flour and one-third potato flour starch."

The parting gift—

## A Vest Pocket Kodak.

It is monotony, not bullets that our soldier boys dread. No fear, when the time comes, they will uphold bravely the traditions that are dear to every loyal American heart. But in the training camps and during the months of forced inaction there are going to be some tedious, home-sick days—days the Kodak can make more cheerful.

Pictures of comrades and camp life, pictures of the thousand and one things that can be photographed without endangering any military secret will interest them, and will doubly interest the friends at home. Tens of thousands of brave lads in the camps and trenches of France are keeping their own Kodak story of the war—a story that will always be intense to them because it is *history* from their view-point. And when peace comes it will make more vivid, more real *their story of their war* as they tell it again and again to mother and sister and wife and little ones.

The nation has a big job on its hands. It's only a little part, perhaps, but a genuine part of that job to keep up the cheerfulness of camp life, to keep tight the bonds between camp and home. Pictures from home to the camp and from camp to the home can do their part.

There's room for a little Vest Pocket Kodak in every soldier's and sailor's kit. The expense is small, six dollars. The cheerfulness it may bring is great. They are on sale by Kodak dealers everywhere.

EASTMAN KODAK CO., 473 STATE ST., ROCHESTER, N. Y.

## THE PASTE THAT KILLS KELLOGG'S ANT PASTE MAKES ANTS DISAPPEAR

One application of Kellogg's Ant Paste and your ant troubles will be over inside of 24 hours. No need to suffer longer when this magic preparation is available. Accept no substitutes. Look for the rattle-cap package.

## WHERE THE BREEZES BLOW

Written for California Cultivator  
By A Native

CALIFORNIA breezes will keep you cool if you but give them a chance. In order to do this you must cultivate the outdoor habit. Learn to live, sleep and eat where the breezes blow. No day is so hot but there is a cool corner somewhere and there you should be.

We all enjoy a camping trip and the freedom from the thousand petty conventions that harass us at home; but few of us realize the possibilities for enjoyment in our own surroundings. We have well kept lawns and prim front porches for other people to look at; while we toil in stuffy kitchens and sleep shut in by walls.

If you wish to enjoy your summer, close up the rooms that require so much attention to keep in order, and improvise quarters on porches, in shady nooks or tents. Under no circumstances allow the lack of conventional sleeping or screen porches to prevent you from enjoying the life-giving ozone blowing free for all.

A little ingenuity and work will provide substitutes for anything you may lack in the way of summer quarters. An ingenious friend of mine, who was

fortunate enough to have large trees at the back of her house, suspended her bed springs by heavy ropes from the limbs of the trees like a hammock and had an ideal sleeping room. The prettiest dining room I ever saw was a large white oak tree, from the limbs of which the table hung, suspended by wires. The green rafters overhead and hard packed earth beneath, with soft breezes playing through, left nothing to be desired.

I once spent a summer in Lake County and was charmed with the unconventional, outdoor life of the people. Under one large oak tree you would see a cook stove, with its attendant pantry shelves, under another the family dining table. Any little backyard shady nook served for a bedroom. There was a free vacation spirit about it all that removed the dragged out drudgery of hot weather.

This does not apply alone to the isolation of the country home. In a little town of the San Joaquin Valley there is a popular form of outdoor sleeping room that is worthy of imitation. Four tall posts form the corners, sheeting or muslin the walls, while the ceiling is the high blue sky, dotted with its myriad stars. Everyone knows the restful joy of sleeping under the stars. There is something

about the eternal unchanging stars keeping watch above your head that soothes the restless, chafed spirit and restores the calm serenity of the soul. In the morning the cool fresh dawn calls you from restful slumbers and the smiling face of nature greets you as you go forth to meet the day.

## KEEPING KOOL

Written for California Cultivator  
By Elinor Rives, Burbank

What's the best way to keep cool? Don't think about the weather! It's a very foolish rule to be always wondering whether it's a hotter day today than it was the day before and does the morning paper say we're likely to have any more? Don't be thinking of the beach where the cooling breezes blow, there is joy within your reach, be the mercury high or low. Keep your temper, "There's a reason" why you should not fume and fret, peace and quiet at this season you will find your "one best bet." Why not cook, eat, sleep outdoors? On the porch or 'neath a tree, save yourself from scrubbing floors, smiles on weary face you'll see. Say farewell to heavy foods, kiss the buckwheat cakes goodbye, in these "sylvan solitudes," eat more fruit and "cut out" pie. Lots of water every day, both outside and inside, too. How the kiddies love to play with the hose an hour or two. Just let old Sol do his worst, plug along the same old way, but please don't assuage your thirst with ice water, it doesn't pay. You'll be cooler if you'll send the thermometer to—the cellar—all things must come to an end. I can't find a rhyme for "cellar."

## PICKLED WALNUTS

The walnuts must be gathered while young and green and be laid in strong brine. Leave them in this for a week, changing it every other day. Take them out, dry them between two cloths and pierce each with a large needle. Throw them into cold water and leave them several hours before packing them in small jars and pouring over them scalding hot seasoned vinegar, prepared in the following proportions: Four quarts vinegar, one cup sugar, three dozen cloves, three dozen black peppers, 18 whole allspice and 12 blades of mace boiled together for five minutes.

## A WORD FOR THE CANDLE

The candle still has a place. The home that cannot have electric or gas lights probably can afford a pretty candelabra for the dining table. This, when filled with well trimmed candles, makes a table centerpiece that will give distinction as well as plenty of light for the meal. Candles are also nice for bedrooms, and many housekeepers like them to use in the kitchen to supplement a bracket lamp.—Southern Agriculturist.

The mother who always lets her children disregard the attentions that are due her pays for it, not only in the lack of good manners which her children show through life toward older people, but she also oftentimes receives from her sons and daughters less affection than the mother who rears her brood in the fear of good manners.

Friendship and charity and a kindness that includes all the varying people of this varying world are within the reach of all, while play, recreation, the art of joy and laughter, are accomplishments we may every one of us acquire, even though we begin late in life!

Are you a companionable mother? Have you time for the children and their questions even though busy with housework or sewing?

## A GLANCE AT WORLD MARKETS

Imperial is practically out of the cantaloupe market for this year. More than a week ago San Francisco was receiving her entire stock from Turlock.

Sacramento River Bartlett pears, No. 1 grade, are being held by the new Pear Growers' Association at \$40 per ton. Marketing headquarters of the organization is at San Francisco.

Contrary to earlier predictions California's apricot output will be large. It would have been still greater had the labor situation permitted.

The onion outlook in the Sacramento section is far better than a fortnight back.

Potatoes are stronger and growers are now securing around \$2.20 to \$2.25 per cwt.

Because of labor troubles in the canneries, beans and many other vegetables have struck a glutted market during the past two weeks.

Especially fine potatoes in the Los Angeles market have commanded as high as \$3.00 and will be higher before they are lower; sweets have commanded around six and seven cents.

Eggs are stiffening every day, and except for local fluctuations will probably advance for some months. Note on opposite page this year's prices in comparison with those of same date last year.

The higher prices of canned meats are reported to be the cause of lessened demand, and jobbers who bought expecting material advance, are reported to be disappointed.

Notwithstanding the immense crop of corn anticipated this year, immense quantities will be imported from South America. One particular feature noted in the corn market was fluctuation caused by conditions in Venezuela. This is the first time conditions in that country have affected the market in this country.

The sizzling heat, with weeks of drouth, is causing western Kansas, Texas, Oklahoma and Nebraska sections to materially scale earlier predictions as to this year's corn crop.

The drouth and heat have not materially affected wheat conditions. Most of the winter wheat is safe and in addition soaking rains have visited many of the wheat growing states.

Oats have been affected somewhat by the price of corn but are holding level. Holland is making heavy demands for export, but as yet has received no permit.

## Book Review

## ENFORCED PEACE

"Enforced Peace," Proceedings of the First Annual National Assemblage of the League to Enforce Peace, Washington, May 26, 27, 1916, published by the League to Enforce Peace, 70 Fifth Avenue, New York.

This league is one of the active supporters of the United States government in the present war. At the same time the book discusses in a most sensible way methods which will lead to an enforced world peace at the close of this war.

## Book Review

## ENGINEERING REPORT

The Fifth Biennial Report of the Department of Engineering of the State of California has a wonderful fund of information as to some of the problems confronting California. The report proper covers 208 pages, then follows a still greater number of pages in various appendices, with information as to irrigation districts of California, alfalfa irrigation in the Sacramento Valley, flood water control in the Coachella Valley, and other most interesting matter.

## ALL THE YEAR ROUND

Cooler cooking in summer—better and more economical cooking all the year 'round.

A good oil stove will cook anything that any wood or coal range will cook, and do it better because of the steady, evenly-distributed heat. All the convenience of gas. Meals in a jiffy, and a cool kitchen in summer.

The long blue chimneys prevent all smoke and smell.

In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

NEW PERFECTION  
OIL COOK-STOVE

STANDARD OIL COMPANY  
(California)

Get the Light  
and Power You Need

from your own generating plant

The UNI-LECTRIC lighting system will put electric light in every room in your house, will run your sewing machine, electric iron, vacuum cleaner, churn, washing machine, etc.

It is Economical and Efficient—Always Ready

Operates with a silent gasoline engine of high speed, generator and automatic governor. Uses standard globes and fixtures. Is easy to install.

Can be used for one or more houses, barns, sheds, work shop and any place where you need light and power.

HAY

Under date of July 28, Scott, Magner & Miller say:

Receipts past week 1785 tons, last week 2291 tons.

This decrease was wholly unexpected, but can, no doubt, be accounted for by the fact that it is already most difficult to get cars for loading hay at shipping points. The railroads claim car shortage and are refusing in many instances to give anything but gondola cars. Demands for box cars are absolutely refused. The most of the arrivals were by boat. Receipts of fancy wheat are small with a good demand. Fancy red oat is plentiful. The government is taking 2000 tons for export this week on the transport "Dix." This hay was purchased in May. In other respects export trade is dull.

Alfalfa arrivals are lighter than usual, with good demand.

Straw is nominal, new crop not having made its appearance.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market. For prices to consumers charges of cartage, commission and handling expenses must be added.

Citrus Fruit Market

LOS ANGELES, August 1, 1917.

Oranges have had an uncertain week and off size and low grade fruit had a hard time to get satisfactory prices. Strictly first class fruit has sold well.

The weather has put lemons on the up grade and some spectacular sales have been made.

Shipments

Shipments of oranges from Southern California since November 1, 1916, 34,780 cars, lemons 6764, total 41,544; to same date last year oranges 27,329, lemons 5862, total 33,191. From Central California to date this season oranges 5042, lemons 164, total 5206; to same date last year oranges 5398; lemons 146, total 5544. From Northern California to date this season oranges 845 cars; to same date last year oranges 610; lemons 1.

### Greatest Book on Feeding.

"Feeds and Feeding", by Henry and Morrison, is the recognized standard authority on the feeding of dairy cows, beef cattle, calves, hogs, horses and sheep. The authors at great expense and with much time and labor, have compiled the most important findings of the investigators of both the Old World and the New in the science of animal nutrition, together with the vast number of feeding trials, conducted in California and the experiment stations of other states, the whole being rounded out by the practical experiments of many of the leading stockmen of America.

## How to Get Best Results Feeding California Barley

"Feeds and Feeding" is a large volume, 701 pages in substantial cloth binding, clearly printed in large type and written in plain, understandable language. It is intensely interesting throughout and represents the sum total of hundreds of experiments, trials, and record tests on practically every feeding combination ever attempted and the personal experiences of the authors and many other noted feeding experts from California to Maine.

Full and complete information is given in regard to the feeding and feed value of California barley, how to obtain the best results, and giving the results of many barley feeding tests. (Pages 162, 303, 309, 360, 414, 454, 525, 590.)

### Only takes a Little Time.

You can obtain one of these valuable books at no expense—just a few minutes' easy work. To any reader of California Cultivator who will secure for us only three new yearly subscriptions to California Cultivator at \$1.00 each—the regular subscription price, we will send a copy of the latest edition of "Feeds and Feeding" by Henry and Morrison. If you want to buy this book it will cost you \$2.25 anywhere. You know California Cultivator and how much valuable information you get from its columns each issue. You receive the best thought and experiences of many of the West's most authoritative writers, the results of many tests and experiments and the live stock, dairy and agricultural news of what is going on over the entire Pacific Coast at a cost of only \$1.00 per year. Your neighbor, if he is not already a subscriber, will be glad to have you show him a copy. You can get three new subscribers at \$1.00 each quickly and easily. Send us the \$3.00 and the subscribers' names and addresses and we will send the book to you postpaid. You may include your own subscription by paying a full year in advance of this date and including two new subscriptions at \$1.00 each. There must be at least two new subscriptions for one year.

## New Record Book for California Producers

The California Cultivator has just published a new and most useful Record and Account Book for California Fruit Growers, Farmers, Live Stock Men, Dairymen, Beet Growers, Poultrymen, and all other California Producers,—something that has long been needed but never before attempted, to suit the peculiar diversity of products of this state.

Among the special pages provided are the following:

"Fruit Crop Record," "Live Stock Record," "Poultry Record," "Daily Record of Labor," "Individual Tree Record," "Dairy Record," "Farm Crop Account," "Live Stock Account," "Household Expenses," "Field Expenses," "Cash Receipts," "Inventory," and others that form a complete, easy-to-keep record system.

There is nothing complicated about this Account Book but it is complete and will be of great value to anyone wishing to know "where the money goes," which crops pay and which do not, who owes you and how much, and many other things to which you may quickly refer.

A copy of the California Cultivator Farm Record and Account Book will be sent to any address prepaid and a year's subscription to California Cultivator, new or renewal will be credited upon receipt of \$1.25. Send all orders to

## To Reduce Feeding Costs

Feeding Live Stock is a Problem and the Poultryman's Problem is Even Greater. Wheat has been his Standby but its Price is now Prohibitive. Corn is Almost as Impossible. How Feed Costs Can be Reduced is Touched Upon for Cultivator Readers by Cornele G. Ross.

**I**N a recent issue of the Cultivator was given under the heading "A War Time Poultry Ration" advice which would seem to me hardly applicable to California conditions. I have no doubt that this method of feeding would apply admirably to conditions in the Central states at the time it was written, but as cracked corn is not a California product, and we have to add materially to the price Prof. Quisenberry quotes to lay it down here, this makes the cost almost prohibitive, and I feel that California poultrymen should take the advice with a pretty considerable "grain of salt."

Even with cost in its favor there is one point in the article which I think needs correction, at least for California conditions, and that is that the meal and fine particles of corn screened from the cracked corn would be wasted unless put in the mash. Possibly many of the poultrymen in the vicinity of Leavenworth crack their own corn, but here we have to buy the

article, and the screenings cost as much as the cracked corn, and if added to the mash must be paid for, besides this, if added in any appreciable amount it would altogether change the composition of the mash. I think here in California we should aim to use local products, especially in the grains we feed our poultry, and with barley and the sorghums we can make up as good a grain ration as one could ask. Just at present the sorghums are rather high in price, owing to their scarcity, but barley can be obtained at very reasonable figures, and if one will compare its composition with corn he will find it comes pretty close, except that the barley carries a little less fat and more fiber.

Many poultrymen have successfully used a grain ration of sorghums alone, when prices were right, while others have been successful with an entire barley ration, so that the writer feels that with the combination of the two grains there should be no trouble in obtaining good results.

At present costs probably 75 to 80

per cent barley and the balance milo or Egyptian corn would work well with any good commercial mash, or even with the mash suggested in the article referred to, but it would be advisable to use some little time in making the change from your present ration. If used with the mash suggested by Prof. Quisenberry it would require about equal parts (by weight) of mash and grain. Some poultrymen feed the barley just as it comes from the field, others prefer to have it re-cleaned, or even scoured, while others soak and drain it before feeding, claiming that it is more palatable to the hens in this condition.

The writer is feeding it all dry on one day and on the following day about one-third of the barley soaked and drained, taking about 48 hours, so that it is hardly what one would call sprouted.

I am feeding about 80 per cent barley and 20 per cent milo, but the milo and a portion of the barley are not soaked so that when the soaked and drained barley is mixed with the dry

grain at feeding time it usually absorbs enough of the moisture from the soaked grain so it can be fed in litter without difficulty.

For comparison, taking the quotations from the daily papers of July 28, the cost of these rations would compare as follows; the cracked corn in the Quisenberry ration would cost \$4.65 and his mash \$3.18 per 100 pounds, the latter figuring bran at \$2.45, shorts at \$3.05 and beef-scrap at \$4.50, and this would make the total ration cost \$3.91, while if you substitute a grain ration of 75 per cent barley and 25 per cent milo, or Egyptian corn, with barley figured at \$2.50 and the corn at \$4.30, the cost of the ration would be reduced to \$3.06 per 100 pounds.

With California conditions so well adapted to the raising of barley and the sorghums it would seem as though it would be a great help to us if our state experiment station at Davis would give us some comparative tests as to the value of these different

## Growing Peas in the Citrus Belt

Rainbow Chasers May Induce Effort at Intercropping Which May Result in Loss to the Citrus Grower. He Should Know His Crop and How to Grow it.

Wm. M. Bristol of San Bernardino County Writes of His Experience With Peas.

**T**HE intensely hot wave that swept the Southern California citrus belt in June and destroyed approximately 90 per cent of the young navel oranges has naturally raised the question of an alternative income for the orange growers.

In San Bernardino County it has been proposed that the citrus orchards, or the younger ones at least, be planted to peas and that a cannery be installed to can them. The project is being pushed by the commercial bodies of the towns rather than by the growers themselves, and the roseate statement is made that the plan is doubly commendable because it will give the growers an income in an otherwise lean year and at the same time establish a new canning industry in the region.

In one of the fanciful tales I heard in my youth it was said that a pot of gold might be found at the base of the rainbow—but I never heard that a single rainbow could be made to yield two pots. Whatever crops may fall in this war-ridden year it is plain that there is to be no shortage in the crop of "advice to farmers." Patient and frugal 16-hour plodders, they are too busy to give heed to the well-meant advisory measures formulated by the chamber of commerce, though they do find time to smile and chuckle as they pursue the even tenor of their industrious way. Knowing full well how many years are needed to master any certain calling even approximate-

ly they refrain from offering to the merchants and bankers any prescription for their respective callings in war-time, feeling that every consistent man, whatever his occupation, will make no radical changes, but will simply be a little more industrious and a little more economical than in times of peace. When President Wilson, addressing the members of the National Grange assembled at Washington last spring, urged them to plant bigger crops and said, "It will not do to be niggardly in respect of the world's food supply," he cast an unintentional aspersion upon the only people in the land who toil without giving heed to the clock.

Having given voice to this little preachment I shall return forthwith to the subject of peas—for I have had many years experience in growing them and feel it my duty to tell what I know in connection therewith.

Advice to those contemplating marriage is sometimes summarized in the single word "Don't." To those who are listening to the pea-planting song of my good chamber of commerce friends I would say, "Don't—unless." And then I would continue by enumerating a half dozen conditions which must be present to promise even a measure of success.

There are many things I do not know about growing peas for canning, for I have never seen them grown for that purpose and do not know that the experiment has ever been tried hereabout. The only difference, however,

between growing them for canning and growing them for immediate consumption would, if done in the orange orchards, lie in the time for planting.

I should state that my experience has been chiefly on my own place of 40 acres on the East Highlands mesa, known as the "Way-up Ranch." Lying as it does on a rather steep southern exposure and a couple of hundred feet above the adjacent valley it is plain that climatic conditions are as favorable for winter gardening as can be found in San Bernardino County. With the exception of the freeze of January, 1913, no injury has ever occurred here to even the tenderest leaves on the orange trees, and yet peas have frequently been frozen. So seldom have the half-dozen favorable conditions been in conjunction that for several years I have grown no peas at all, even where the orange trees were small enough to permit it.

Unless the soil is fertile and in good physical and mechanical condition—that is to say, well supplied with humus—peas will not thrive. It is doubtless true that leguminous plants will take nitrogen from the atmosphere, but it will surely require one pioneer generation of them to make life worth while for the next one.

In the aforesaid advice to pea planters it is affirmed that peas may be planted as late as September 1. This is equivalent to saying, plant them in August. Now, be it known, peas do not thrive in hot weather—

and September in the inland citrus belt is almost always hot. After a dozen years experience I decided that September 20 was the earliest date on which it was safe to plant. If started sooner they seem to become discouraged and the vines are frequently destroyed by a worm which has never molested the later plantings. Young pea plants will withstand a greater degree of cold than those which are in bloom; and, even if peas planted in August happen to thrive, they are likely to be in bloom when the January cold spell strikes them.

On the other hand I found that peas planted later than October 10 get into market so late that they come into competition with those grown by cheap Asiatic labor on lower-lying land—and the Caucasian has not yet mastered the Oriental mode of life.

Another difficulty in growing peas lies in the problem of eliminating the weeds. If there happens to come a rain within six weeks after planting there will be a crop of weeds that will be exceedingly troublesome—unless the weed seeds are all started by copious irrigation before the ground is made ready for the peas.

If, instead of a winter that is too cold there comes one that is warm and wet, it is almost certain that mildew will be rampant and will interfere with best results. If the ground to be planted is near any wild land there will be rabbits and quails to contend with. It is a matter of record, however, that no game warden has yet

found a jury that would protect these pests on the Way-up Ranch.

If, in conclusion, the pea crop has passed safely through all these vicissitudes, it has yet to be picked and marketed; and there is no more soul-trying experience than getting peas picked in the proper stage of development. I think it was this one difficulty more than any other that terminated the industry on my place, while there was yet abundant room between the trees.

Frankly, I think the planting of peas in orange groves for canning purposes will prove a disappointment. I do not know where the canned peas of commerce are grown but believe it is in regions of cooler summers where they may be planted after danger from winter cold is past.

#### Postscript

If one rainbow is good for two pots of gold there is no reason why one pea-planting story should not be permitted to produce two pots of pessimism—one at each end. And this is the burden of my second preachment:

The time is at hand for a new code of calculations in connection with the citrus industry in California. For a number of years prior to the big freeze the orange orchards of Southern California, the majority of them being in their prime, yielded good crops and brought good prices. Exceptional yields and exceptional prices were used by speculators to boost the price and the supposed value of land planted to oranges. Many people from the East were induced to purchase orchards at prices based upon regularly good annual crops and regularly good prices. Any man who warned a tenderfoot to wait a year before buying real estate in California was branded as a traitor.

Well, it is now apparent that orange growing, instead of being a gentleman's pastime, is simply one branch of agriculture—and agriculture in all ages and lands has been successful only when based upon industrious toil and frugal economy. Speculation has no place therein; and the evils engendered by speculation in California orchards must be eliminated. Instead of a doubtful search for something to bring an income from an orange orchard without oranges the assessment and the price of the orchards must be lowered to the point commensurate with an occasional loss of crop; and in this connection it must be remembered that the loss of one year's crop means the loss of two or three year's profits—for it costs just as much to care for the orchard during a year of failure as during a year of success.

No, I am not a pessimist, nor yet a traitor to the state of my adoption. After a residence here of more than 30 years I feel that I would rather live in a tent in California than in a palace East of the Rockies. But God forbid that I should be guilty in any degree of inducing any stranger in this land of great possibilities to spend his time and his money in digging at the base of rainbows.

#### CALIFORNIAN INVESTIGATING CITRUS CANKER

Field Deputy Avery S. Hoyt of the Southern California district of the state horticultural commission left last week for Florida and other South-eastern states to gather data on the citrus canker, which it is hoped can be used to advantage in protecting the growers of California.

# Effect of the Heat Wave on Citrus Crops

Written for California Cultivator By G. W. Waterbury

**T**HE heat wave of the middle of June, culminating in the unprecedented temperatures of June 16, 17 and 18, was disastrous to our coming citrus crops, but not to the trees themselves, except in Ventura County, where the added presence of forest fires caused such abnormal temperatures that some foliage was injured and young trees destroyed.

During this time the temperature at the government station at Needles went to 120; temperatures in the Imperial Valley were reported at 124; and for over a week the mercury registered between 110 and 118 each day in the citrus growing belt of Southern California. Central California got off easier with temperatures about five degrees below those in Southern California.

The peculiarities manifested by the heat wave upon citrus trees were noticeable in the failure of the Navel and lemon trees to hold fruit and the apparent indifference among the seedlings to such damage. Sweets set about as usual; Bloods are holding considerable fruit, as are Valencias and St. Michaels. From present indications there will be about 20 per cent of a crop of Navels; 50 per cent of lemons and 85 per cent of all other varieties in Southern California. Central California will do much better, with fully 50 per cent of a crop of Navels.

Circumstances affecting the set of fruit this past spring were an exceedingly late spring and a very abrupt ushering in of summer in June. Navel blossoms that sometimes appear the middle of March were still on the trees during May. Lemons had borne heavily during the past winter and set fruit generally late in April and during May. And it was the small fruit that universally succumbed to the forces of heat.

When the heat wave had passed it was noticed that all small fruit recently set had been charred on the trees. The form was all there but blackened and still clinging to fruit wood that would never mature it. Larger fruit, about the size of a walnut, usually remained untouched, unless exposed on the south side of the tree to the full blistering heat of the sun for a considerable portion of the day. Valencias, however, seemed to set while very small on the trees.

The set of fruit, in most sections, can be traced quite accurately to the conditions of the orchard, but this condition runs back several years. No Navel or lemon orchard that had not been properly fumigated, fertilized and pruned for several years past set fruit this spring and held it during the heat wave. It was a question of new, vigorous growth last year, which had to be helped along by heavy pruning on all old trees. Fruit wood which has borne for a number of years has outrun its purposes and then becomes a liability to the tree and to the orchardist's pocket book unless removed. The mere size of the tree should be no criterion to go by, although large sized trees, if heavily fertilized and kept religiously free from scale insects by fumigation, will yield more fruit than smaller ones, other things being equal. But no citrus trees, when annually accumulating poor and

useless wood, should ever be kept at any fixed size.

The unpleasant features of this severe crop shortage are that orchards must now be carried 18 months before much income arrives. It also means that no orchardist who is in the business to stay can let down on giving his property the same usual good care as formerly. If during the coming year scale accumulates in his orchard to an alarming degree; if cultivation is neglected and especially pruning is not well done, then the trees will deteriorate and no crop will be forthcoming when the next year's harvest arrives. Probably fertilizing can be cut some, for the absence of fruit this year will cause little loss of fertility from the soil. The growing of intercropping produce in old orchards is impractical and a heavy drain on the soil and water during the warm months.

The one good feature of last month's heat was the stimulating features to the trees themselves; and most of the older orchards needed it pretty bad. Since the first freeze new growth has not appeared on our trees as it did in former years. The leaves looked old and lifeless or tinged with mottle. The trees were filled with sapless fruit wood, and the north sides of our trees in many sections had been barren of fruit for some years past.

But the heat changed this to an appreciable degree, first by relieving the overworked trees of about all their fruit and second by warming the soil to a depth that it had not been warmed before. Two things citrus trees like: warmth and moisture in the air. Had our humidity been high during the heat of June our trees would have laughed at the warmth and set fruit and put out new growth at the same time.

Fruit trees are under their greatest strain during blossoming time, and the returning warmth with moist atmospheric conditions bring this about. But without a certain amount of moisture in the air no amount of water in the soil will cause blossoms to spring forth from even a lemon tree. After the young fruit is well set a good supply of water in the ground will cause rapid sizing of the fruit. Unquestionably large amounts of scale have been killed, but the proportion will depend upon how open and well pruned the trees were and when the hatch was maturing. A thick, dense tree provides cool, moist conditions that all scale thrives on, especially the black. The red, purple and yellow can stand a good deal of heat and the citricola thrives upon it.

Good advice relating to fumigating this fall would be for all those whose orchards were in good shape last fall and this spring to fumigate late, if at all, and for all those who have owned chronically bad orchards to fumigate early this fall and by the aid of the recent heat try to bring about normal conditions where such have not been the case for many years.

Expense should be reduced first in the packing and handling of our fruits. Common labor cannot be reduced appreciably, if at all, but packing house forces can, and the managers, where paid high salaries before for handling big crops, should not ex-

as much for handling very small puts.

Exchange houses there should be getting together for greatest efficiency and least expenditures. The members are all for vigorous cooperation except where packing houses are concerned; a place where the largest amount of duplicated waste occurs. The managers of big and profitable businesses showed us that; they began a few years ago closing up all unnecessary houses, beginning with the forest plants, and so vastly reduced the cost of the produced article. Today there is absolutely no justification in two Exchange houses being located within one mile of each other, sipping through the same Los Angeles office and using the same methods for harvesting and distribution. That is, except human obtuseness and reasonableness. We all agree that a well paid manager is better than two or three poorly paid ones and that one well equipped plant is more desirable than half a dozen poorly equipped ones. A psychological distrust of other members of the same cooperative concern is the only excuse for complicated Exchange houses in the same vicinity. And the California citrus crop has been cut by the recent heat wave to one-third its usual yield, way below operating expenses, and the citrus orchardist now has 18 months before pay day.

#### CROP REPORT

**T**HE state commission of horticulture has issued its monthly report of condition of the fruit crops of California. It is dated August 4. From it we take:

Apricot harvest finished in all counties but San Luis Obispo and San Diego; the former with 80 per cent of crop, the latter with ten. Cherries all harvested. Berries about half harvested; Alameda, Nevada, Sacramento, San Benito, Santa Clara, Sonoma and Stanislaus Counties from present indications will have a full crop, or 100 per cent.

**Almonds**  
The output of almonds for the state will be about 59 per cent. San Joaquin and Stanislaus Counties will have a full crop; Contra Costa, 70 per cent; Sutter, 65 per cent; Sacramento, 60 per cent; Yolo, 50 per cent; Tehama, 40 per cent; Butte, only 15 per cent; and Solano, only ten per cent.

**Apples**  
California will produce 90 per cent of a normal apple crop.  
Santa Cruz, which produces half the apples of the state, reports a 100 per cent crop. Kern, Lake, Mendocino, Sacramento, San Benito, Santa Barbara and Sutter Counties also report 100 per cent crops. Sonoma has an 80 per cent crop; Monterey, 75; San Bernardino, 95; Nevada, 80; Los Angeles, 85; Humboldt, 80.

**Figs**  
Figs are California's heaviest averaging crop this year, 97 per cent of normal the state over.

In figs, Fresno County, producing 53 per cent of the total output of the state, reports a 100 per cent crop. Other counties reporting a full, or 100 per cent crop, are; Butte, Colusa, Madera, Merced, Tehama and Tulare. Stanislaus will have 110 per cent; Yolo will have 80 per cent; Yuba, 90; Sutter, 60; Los Angeles, 75.

**Peaches**  
State average, 88 per cent of normal. Fresno, the largest peach producing county, reports a 90 per cent crop. Tulare, the next largest producer will have 100 per cent, as will Contra Costa, Los Angeles, Merced, Orange, San Benito, San Bernardino, San Joaquin, Stanislaus. Madera reports 120 per cent; Sacramento, 105. Kings County reports 95 per cent.

**Pears**  
State average for the pear crop is 87 per cent. Sacramento, the biggest pear county, reports a big crop, 120

per cent. Napa County will have 110 per cent. The following counties report 100 per cent; Colusa, Kern, Lake, Mendocino, Nevada, San Benito, Solano, Sutter and Yuba. Alameda reports 80 per cent; Butte, 20; Contra Costa, 70; El Dorado, 85; Placer, 50; San Joaquin, 90; Santa Clara, 65; Sonoma, 90; Tehama, 50; Yolo, 75.

#### Plums

Plums average a little better than half a crop throughout the state. Of the larger plum growing counties: Placer, growing more than one-third of the state's output, reports only a 35 per cent crop. Santa Clara will have 72 per cent; Solano, 75; Sacramento, 100; Los Angeles, 80; Tulare, 95; Yolo, 80.

#### Prunes

The prune yield of the state will be about three-fourths of normal. Santa Clara, which normally produces 55 per cent of California's supply of prunes, this year reports a 72 per cent crop. Sonoma, next in order as a prune producer, will have 70 per cent. Of the other commercially important producers, Butte reports 60 per cent; Napa, 100; San Benito, 75; Solano, 75; Tulare, 100; Yolo, 90.

#### Walnuts

Average output for the state is about 83 per cent of normal. Orange County's output will be cut down to 70 per cent. Los Angeles will have 95 per cent; Ventura, 75. Santa Barbara reports a crop above normal, 115 per cent; Alameda, Colusa and Contra Costa, 100.

#### Olives

Butte County reports a 65 per cent crop; Los Angeles, 25; Riverside, 30; Tehama, 50; Tulare, 65; Sacramento, 50; Fresno, 100; Madera, 65; San Bernardino, 35; San Diego, 40; Santa Barbara, 70; Yolo, 75; Yuba, 80.

#### Oranges

Los Angeles reports a half crop; San Bernardino, 20 per cent; Riverside, 13; Ventura, 15; Tulare, 65; Orange, 80; Santa Barbara, 90.

#### Lemons

The state over, lemons average 39 per cent of normal.

Los Angeles will have half a crop; Riverside, one-fourth; Ventura, ten per cent; San Bernardino, ten; San Diego, 60; Orange, 70; Tulare, 95.

#### Grapefruit

Santa Barbara reports a full crop of grapefruit; San Diego, 90 per cent; Butte, 25; Los Angeles, 75; Riverside, 78; San Bernardino, 75; Tulare, 80.

#### PRODUCTION OF PHOSPHATE ROCK IN FLORIDA DURING 1916

The phosphate rock industry in Florida during 1916 has been, as in 1915, very much interfered with by the European war, says E. H. Sellard, state geologist of Florida. There is a great demand for rock in the European countries, but steamers have not been available in which to make shipment and freight rates have been excessive. While the foreign business has thus been seriously interfered with the domestic demand has remained about normal.

The total shipment of phosphate rock in Florida for 1916 as reported by the producers was 1,515,845 long tons, of which only 47,087 tons were hard-rock phosphate, the remainder being land pebble. The shipments during the preceding year were land pebble, 1,358,611 long tons; hard rock, 50,130 tons. The value of the phosphate shipped from Florida during 1916 was as follows: Land pebble, \$3,874,410; hard rock, \$295,755. Total, \$4,170,165. The value of the total shipments during the preceding year was \$3,762,239.

#### NEW CITRUS ASSOCIATION

A new citrus association has been organized in the district south of Covina in Los Angeles County. It has received its charter and will affiliate with the California Fruit Growers Exchange. Calvin E. Pratt has been elected president; F. F. Barham, vice-president; Franklin Flick, secretary; Nellie M. Stange, assistant secretary; E. A. Cooper, treasurer. Other directors are A. E. Colt and B. W. Dancer.

Association of Southern California

115 So. Los Angeles St. Los Angeles, Cal.

## Who's Who

It has occurred to the Cultivator that in its endeavor to encourage animal industry it has perhaps given undue prominence to the animal and not given the credit which may be due to the men behind. Hence, "Who's Who?", that is, amongst the livestock producers of California who are some of the men responsible for its large development. Where did they come from and how long have they been engaged in California development, also how do they look, so pencil and camera are to be used, and some homely, everyday photographs and notes regarding them will bring us closer together. Bear in mind we say "homely photographs" and not photographs of homely people. The idea we wish to convey is that so far as possible we will secure photographs in everyday surroundings at the homes of the livestock producers.

We start this week with Mr. Stalder, one of California's pioneer livestock men. A dozen more similar articles are already in hand and still others are coming, written by Cultivator field men. Next week's "Who's Who" will be a Northern Californian.

**W**HEN I came to California in the early eighties a residence of six months made quite a respectable citizen, while one who had been so fortunate as to be here for a full year automatically became a pioneer. Those were the beginning of the good old boom days. Most of us were so busy farming each other that other types of farming were relegated to the natives or the old settlers. It is interesting these days to find one who was a "for sure" farmer along in '82 and '83.

Such was A. J. Stalder, who came from Nebraska and engaged in "large farming" on the red mesa lands west of Riverside and southeast of Ontario, generally considered at that time in the "wind belt." Mr. Stalder was farming anywhere from 1000 to several thousand acres, keeping hundreds of small California horses busy on gang or combined thresher, going broke some years, being financed and making a strike the next. When the

prosperity of the fat years came the debts of former years were cleared off and a fresh start made. For 35 years Mr. Stalder had been farming these lands "making and breaking" at the grain farming, but nearly a dozen years ago that type of farming ceased to appeal to him and the big combined and many of the implements used in grain and hay farming were disposed of. Dairying looked better to him, and securing 240 acres of rich bottom and mesa lands not far from the Santa Ana River he installed hay barns, silos, milking stables and sheds and proceeded to buy a bunch of Holsteins. We say he did, though associated with him in his farming operations has been F. W. Stalder, his brother. Both have lived in Riverside for many years.

But about the dairy farm. The 240 acres was planted either to grain hay, to alfalfa, to corn for silage, or to mangels for a light ration for the cows. The idea was to make the ranch produce everything the cows needed. This, and the choosing of high producing animals, has been the

prime factor in the upbuilding of the profitable and successful dairy plant. We say the choosing of high producing animals has been a great factor. This was a lesson, however, which had to be learned. A good dairy is not picked up in a day. The best of judges of dairy cows cannot go out

ticed not only convenient arrangement of hose but frequent notice prominently posted, "Positively No Smoking."

Again in reducing the H. C. of L. did not wait the war campaign "growing your own," but for years grown in a large garden near the house a big supply of potatoes, rising ears, tomatoes, everything needed on the ranch table. I ate lunches with the ranch workers, 14 of the and, believe me, those men get good meals. Every item of the meal except the flour, sugar, coffee and salt, were products of the ranch or garden. There was soup, roast pork and apple sauce, vegetables aplenty, fruit and a big pitcher of milk—all home made.

Mr. Stalder has made a successful farming and has advanced California interests for the past 35 years, and I'm glad to give from his methods a few hints which may prove helpful to the rest of us. The state record breakers in his dairy show that he has a supply of the live wire stuff which changing California from the old high and tallow days to a virile factor in the problem of feeding the world. The Rambler.

### THE CONCRETE HIGHWAY

The concrete highway has an organ devoted to its advancement in "The Concrete Highway Magazine." It urges better roads, not only for military preparedness but for agricultural preparedness, and for many other good and sufficient reasons. Concrete roads fill the gap between railroad roads that afford a speedier movement than the volume of short haul tonnage requires in economical handling, and earth roads that are not speed enough.

Concrete roads accommodate all types of vehicles and afford an unlimited and flexible service. Short line railroads afford a limited service for only one type of vehicle, and the people don't own that. Not every one owns a railroad train; nearly everyone now owns an automobile.

### BULLETINS ON CANNING AND DRYING

Farmers Bulletin 839, "Home Canning by the One-Period Cold Pack Method," and 841, "Drying Fruits and Vegetables in the Home," are timely additions to conservation literature, now so popular. Everyone who has fruit or vegetable products which may go to waste unless handled in the home should write the Department of Agriculture, Washington, D. C., and ask for these two bulletins. They are free.

### POWER ON THE FARM

Manager O'Neill of the Tractor Engine and Implement Dealers' Association writes that the plans for the tractor demonstration to be held at Los Angeles, September 18-22, are maturing and the interest shown by those who will demonstrate tractors and those who know of their ability to do things on the farm guarantees a most successful show. There will be not only a demonstration by tractor manufacturers, but implement people are vying with each other in the showing which they hope to make of farm implements. Interest in the demonstration is increased by present labor conditions and the demand for every ounce of product the soil can be made to yield.

It has been claimed that the cost of production may be cut at least 40 percent by letting gasoline do it. In any case this demonstration will offer opportunity for hearing the claims of the manufacturers and for seeing what tractors and implements will do in the hands of skilled operators.

A. J. Stalder

For 35 years a producer of California crops.

and buy, within reasonable cost, an all around high producer, rather he cannot do it every time in buying a long string.

Mr. Stalder provided milking barn room for 120 cows. He later decided that half that number carefully selected would mean more profit and a material reduction was made in the number of cows. The wisdom of his choice is shown by an item in the California Cultivator of July 14 in which Stanislaus Princess Cleopatra reported in her seven-day test producing 513.9 pounds of milk, from which was made 31.04 pounds of butter, this as a senior three-year-old. This cow was the holder of three state records. Her milk tested 4.83.

But this is not the place for chronicling the production of this one of Mr. Stalder's cows nor of telling of King Pontiac Netherland Segis, a great bull who is starting on the making of a record, nor of his first daughter soon to be ready for a test. This is more the story of Mr. Stalder and his work.

He has made a success of farming because he is a business man and has applied business principles to his work. In the first place he bought good land; he has stocked it with high priced animals; he is doing his work with labor-saving implements so far as possible; his barns are arranged and fitted so as to be labor-savers. For instance, the silos of 600 tons capacity, beet-shredding and mixing bins are at one end, and from them he has carriers of sufficient capacity to take a wagonload of silage or feed along an alleyway to 120 cows, with barns, milk houses and other buildings so arranged as to reduce steps and labor. On the point of the compact arrangement of his buildings Mr. Stalder said that he faced one danger in this, that in case of fire his loss might be greater, but he considered the saving in labor more than offset this risk. In regard to fire, we no-

## The Cool-off Three--- Wind, Wave and B. V. D.

**N**ATURE has created two unfailing agents of coolness to offset summer heat—Wind and Wave. The ingenuity of man has evolved the third—B. V. D. Put it on, and you're more comfortable and competent for anything on the day's slate, from work to frolic.

In our own modernly equipped Cotton Mills at Lexington, N. C., the mainbook from which Loose-Fitting B. V. D. Undergarments are made, is produced in a scientific manner from selected cotton to insure durability in wash and wear.

In our own B. V. D. Factories the garments are skillfully cut, strongly stitched, accurately finished—to fit and to be cool and comfortable all day long.

# FRUIT JUICES

By W. V. Cruess

**L**OGANBERRIES, grapes, apples, lemons, pomegranates, and a few other fruits give satisfactory beverages when the juice is pressed out and pasteurized in bottles. This offers a good way to utilize the empty bottles that may be found in the household.

## Loganberry Juice

Crush the berries and heat with constant stirring in an agateware pot to about 150 or 160 degrees Fahrenheit. A dairy thermometer can be used to test this temperature. Strain out the juice from the jelly bag. Place the juice in bottles, filling the bottles within an inch of the cork. Cork the bottles with corks which have been sterilized in boiling water for ten minutes. Tie the corks down with string. Sterilize the juice as follows: Place a cloth or a screen in the bottom of a large pot or wash-boiler. Lay the bottles of juice in a horizontal position on this false bottom. The bottles may be piled one above another and the container filled with water. Fill the container with water, completely covering the bottles. Heat the water slowly to a temperature of 175 degrees Fahrenheit and not above 185 degrees Fahrenheit. A dairy thermometer can be used to test the temperature of the water. Keep the water at this temperature for 20 minutes. This can be done by setting the pot on the back of the stove when it has reached the desired temperature. Remove the bottles and dip the corks in melted sealing wax or in melted paraffine several times while they are cooling to thoroughly seal the corks with the melted material.

## Grape Juice

Use a mixture of equal quantities of Muscat and some red wine grape. The Muscat gives the flavor and the wine grape the color. Heat the mixture after crushing in an aluminum or agateware pot to a temperature of about 130 degrees Fahrenheit. This is to extract the color. Set the heated berries aside for 24 hours to allow the color to dissolve in the juice. Press out the juice and strain it through cheesecloth or a jelly bag. Bottle and sterilize as for loganberry juice. The Isabella grapes also give good results when treated in this way. No sugar should be added.

## Lemon Juice

Cut the lemons in half and separate the juice without getting any oil into the juice. The oil injures the flavor. Bottle the juice and pasteurize as directed for loganberry juice.

## Orange Juice

Oranges do not give satisfactory juice and are not recommended for this purpose. The flavor in this case deteriorates badly after pasteurizing.

## Apple Juice

Press out the juice and pasteurize as directed for loganberry juice. The apples need not be heated before pressing.

## NEW AGRICULTURAL BUILDING AT UNIVERSITY FARM

Construction work has begun on a new \$350,000 agricultural building on the Davis farm. An experimental cold storage plant is to be installed in the basement hall to develop the best methods for refrigerating fruits during shipment. Here also will be rooms filled with machinery for experiments in the utilization of wood and the handling of fruit. There will

be also student and research laboratories for the study of soils, and a work-room for citriculture.

## AMERICAN POMOLOGICAL SOCIETY FALL MEETING

The regular biennial meeting of this organization will be held in Boston, Massachusetts, October 31-November 4, 1917.

The occasion in full will be a regular meeting of the Massachusetts Horticultural Society, the New England Fruit Show, and the American Pomological Society. Very full and extended programs covering all phases of fruit growing will be rendered and an exceptional exhibition of fruits, fruit products, and allied material will be staged.

The American Pomological Society will feature the Wilder Medal, its distinct and special honor for new fruits, discoveries in pomological science, and for specially meritorious exhibits.

Unique exhibits and demonstrations with some of our newer fruit introductions such as avocado, and fruit juices as the loganberry juice will be in evidence.

Those who contemplate offering new fruits for the Wilder medal should advise the secretary, E. R. Lake, 2033 Park Road, Washington, D. C., in order that registration and entry cards can be properly made before the meeting date.

The A. P. S. program is being prepared for early announcement by the president, W. N. Hutt, Raleigh, N. C. Suggestions along this line should be addressed to him.

## DELAY OPENING OF SCHOOLS

Commissioner Hecke has asked that opening of schools be delayed one month. That the labor problem will prove a more serious one before the final harvest period is the opinion of all who have investigated conditions thoroughly, and for this reason Mr. Hecke's appeal will be received with general favor in all sections of the state.

R. P. Cundiff, newly appointed field deputy under Geo. H. Hecke, commissioner of horticulture, has been investigating general horticultural conditions, in Eldorado, Placer, Yuba, Sutter, Solano and Napa Counties. He found a practically unanimous determination to comply with the new statutes as regards standardization, squirrel control and other regulations. Mr. Cundiff will continue his investigations until he covers every county in the state. He is now in Southern California.

## MONTHLY BULLETIN

State Commissioner Hecke should be proud of the present July issue of the Monthly Bulletin. It has to do with citrus canker, a pest which is costing southeastern parts of the United States millions of dollars annually. This number of the bulletin is splendidly illustrated and every citrus grower of the state should secure it and inform himself so that he may aid in preventing this pest from getting a foothold in California. We believe as yet the pest has not crossed the Rocky Mountains.

## THE DRAINAGE OF IRRIGATED FARMS

"The Drainage of Irrigated Farms," Farmers' Bulletin 805, by R. A. Hart, published by the United States department of agriculture. This bulletin touches upon the need of drainage in irrigated lands, beneficial results,

# On the Farm

SOOTLESS PLUGS — with their MICA insulation—are rapidly replacing "stone" and "porcelain" plugs on the farm.

For no other insulation so successfully withstands the destructive effects of high Speed, Power and Heat on engines, tractors and cars.

Long after other insulations have succumbed to the terrific strains—SOOTLESS Multi-Wound MICA will still be on the job. Conserving every bit of the current—and insuring a fat hot spark.

### for Tracklaying Tractor and You Need to Order Now

Horses are 143% higher than during past decade. Feed is 100% higher. Labor is more scarce. There's a *double need* now for tractors. Don't take chances. Tractor material is becoming harder to secure and higher in price. If you expect to have a tractor between now and spring, order now for future delivery at present price—and thus be sure of getting this tractor.

**Note These Features:**

1. Pulls instead of pushes itself over the ground. All power goes to pull.
2. Can be "gee-ed" and "haw-ed" out of holes and soft places like a team.
3. Has full-power pull on turns as well as on the straight-away.
4. Turns clear around in a 10-foot circle (5-foot radius).
5. Plows or harrows as close up in the corners of fields as a team.
6. Plows as close to vines and trees as a team.
7. Goes under branches of trees that no team can get under.
8. Pays for itself in what it saves.
9. Light weight—3100 pounds—on long track surface. Less weight to square inch than man's foot.
10. Simple 4-cylinder automobile type engine. Burns engine distillate.
11. Runs stationary machinery up to 10 h.p. when not working in fields.

If you attend the Tractor Meet to be held in Los Angeles, by the Tractor Engine and Implement Dealers' Association, on the Downey Road, Sept. 18th to 22nd, inclusive, be sure to call at our exhibit and watch the the Bean TrackPULL Tractor work under actual field conditions.

# Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Blackhead Possibly

Could you tell me what to do for my big turkeys? I have just lost one big tom and the old one I think has just come down with the same trouble. Symptoms: eats little, legs seem unsteady, sits down most of the time. Have had them shut up in a park but now for the last day or two I let them range, but they hang around the park. Have a good house at night, board floor, plenty of air. Have been feeding bran, table scraps, clabbered milk, a little green, lettuce, no grain, as I had none. Perhaps they lack strong feed like a grain. The one that died would not eat at all though I put onion in front of him. He just sat around and died. Head was pale.—Subscriber, Inglewood.

Your tom's legs may merely be weak from lack of exercise and want of lime in the ration, but his pale head makes me suspect he may have blackhead. The only thing you can do is to change your method of caring for the turkeys. You have already given them free range. If they hang around the house take a stick and drive them off. If necessary stay with them a while. This takes time, but there is no other way of inducing turkeys to take the exercise they need. They should sleep in the open. The top of a six-foot chicken fence is a good place. If you have not that fix a high roost. The clabbered milk is all right—nothing better for turkeys—but I would go slow on table scraps. A good ration for turkeys that have not sufficient range for all their living consists of rolled breakfast oats mixed with chopped onion and lettuce in the morning, hard grain at night and clabbered milk or cottage cheese late in the forenoon. If they do not get much green from their range give a head of lettuce once during the day. Once or twice a week give a dish of bran in which a handful of bone meal has been mixed. There is no cure for blackhead, but if the disease is not fully developed you may head it off by a ration of greens, (especially chopped onion and onion tops) and clabbered milk. At any rate you will save the rest of the flock.—J. A. K.

### Shooting Trespassing Poultry

Please advise what penalty would attach for shooting trespassing poultry where the owner has been notified to keep same off the premises and refuses to do so.—Subscriber, Heber.

This question was practically answered in the legal department in effect that one is not justified in taking the law into his own hands. Of course there is a factor which enters into the question, that of protecting one's own property from trespass. Presumably the penalty which would attach would be that any stock or poultry destroyed might be cause for action, in which the owner would recover actual value.

### Fungus in Beans

A Pomona subscriber sends stalk of bean plant which shows the work of fungus right at surface of soil. Not only this plant but almost the entire field was affected. The specimen was referred to Prof. Clayton O. Smith of the Southern California pathological laboratory, and he writes:

"I have examined the specimen of bean recently received from your Pomona subscriber. I find it to be at-

tacked by a fungus, probably a species of rhizoctonia. You may recall that this fungus is prevalent on many different kinds of hosts and it seems to be a rather common disease of the bean. There seems to be no very practical control as the fungus lives in the soil and under certain conditions seems to be able to attack the plant."

### Radishes Pull Themselves

What ails my radishes? They grow almost entirely out of the ground. The tip of the root only penetrates the soil and not only the top and leaves but the greater part of the edible portion of the root lies on the ground.—Subscriber, South Pasadena.

This is caused by the seed being planted too shallow. Place the seed an inch deep. These have the appearance of the seed being planted only an eight or a quarter of an inch under soil.

### Tomato Worms

Please advise what to do to secure control of tomato worms. I have four acres which are almost ready to ripen but the worms are stripping the plants. Have tried to pick them off but they keep coming. What spray could one use which would not injure the tomatoes?—Subscriber, East Bakersfield.

Spray with arsenate of lead mixed with water at the rate of four pounds per 100 gallons. Keep thoroughly stirred while spraying. Arsenate of lead preparations in the dry powdered form sprinkled over the vines have also proved effective.

### Uncle Ben Plum

Mr. M. Sharpe answers very correctly your correspondent's inquiry regarding this plum. May I add to it by saying that it originated as a chance seedling in the garden of the late B. H. Crow of Crows' Landing, Stanislaus County. Mr. Crow was one of California's pioneers, familiarly known as "Uncle Ben." He called my attention to the fruit 25 years ago, when I secured buds and have propagated it ever since. Mr. Edwards of Los Gatos planted a commercial orchard of "Uncle Ben" and the crop was handled by the A. Black Company who have shipped the plums to London. "Uncle Ben" is the name, and I heartily join with Mr. Sharpe in protesting against any parties giving it any other name, which is, unintentionally let us hope, a fraud on the public.—Leonard Coates.

### Martynia Louisiana

Please advise name of plant, the seed pod, leaves and bloom of which are enclosed. Also, is the plant of any commercial value?—Subscriber, Los Angeles.

This plant is popularly known as unicorn plant. The fruit when ripe splits into sections at the tip and produces the "devil horns" that are such an annoyance to cattle on the ranges in Arizona. Botanically it is known as Martynia Louisiana. I do not know that it has any commercial value. In Bailey's Cyclopaedia of Horticulture we note: "Martynias are sometimes grown in gardens for their bright large flowers, abundant foliage and odd pods. They are treated as half-hardy annuals. They are also grown in the vegetable garden for the small tender pods which are made into pickles the same as cucumbers. It is native from Indiana to Utah and to Texas and New Mexico; naturalized farther east and north."

### Olive Oil

Please advise if olive oil contains any medicinal qualities which would make its use as a part of the diet food unwise.—Subscriber, Pomona.

The medicinal qualities of olive oil are well known and we have never heard of any injurious results from liberal use. It has been used the best of any of our edible vegetable and if there were any injurious results from its use they would have been known years ago. Use more olive oil and grow younger.

### Onions

Do raw onions contain a sufficient quantity of opium to cause injury when eaten in large quantities? Would cooking help to eliminate a portion of this?—Subscriber, Pomona.

We have never heard of the onion charged with being a carrier of opium. If one wishes to reduce the manifestation of its highly aromatic character it may be boiled before eating. This expels a large part of its more pungent character and the breath does not manifest the unpleasantness sometimes as in the case of the raw onion. It may be interesting to know that while the potato is known in a general way in certain countries of the world and our Indian corn so popular in this country is of limited distribution there is no country in the world which does not make the onion an important feature of its diet.

### Misprint—"Grain" for "Green"

An error was made in answer query as to limberneck in issue July 28, page 80, fifth line from end. It should have read "Give plenty green at noon and also in the morning." "Green" was unfortunately made "grain," which is quite a different matter.

# Veterinary

### Scab on Neck

My cow has dry scabs all over the wrinkles in her neck and down on her body. She licks and bites it into raw sores. Have tried lysol, creolin, tobacco and ointments of every description. We keep her blanketed at the time and she has been tested for tuberculosis three times. Have been feeding her epsom salts also. What can be done for her?—Subscriber, San Gabriel.

The trouble is probably due to mites in the skin. Would advise scrubbing the scabs off and scrubbing the parts clean with soap and warm water. When dry apply a solution of permanganate of potash, two drams to the gallon of water. Also have prepared an ointment of tincture of iodine two ounces, iodine crystals two drams and lard oil to make 12 ounces. Apply the ointment once a day to the spots that do not look healthy after the use of the permanganate solution. Rub the ointment in well so it will reach the mites. The ointment may be applied with a swab so it will not color the fingers.

### Cows Not Breeding

Kindly advise what to do for four cows which are not with calf. They come in season regularly every three weeks and this has been going on for three months. The cows look healthy. Two lost their calves and the other two had no trouble with theirs. Is there anything that can be done for a cow that loses her calf one month before time? We could see no reason for her doing so.—Subscriber, Alameda.

Considering the fact that two lost their calves before full time one might think that it was contagious abortion. There was a long article in the Cultivator of March 3 on page 256 fully describing the latest methods of treating contagious abortion, and all owners of cattle should preserve such articles for future reference. Your trouble may not be contagious abortion and the reason for them not getting with calf may be entirely with the bull. Try a young bull as their service seems to be oftener followed with success. Read the article referred to and compare the symptoms with those in your case and you will be better able to judge what is the trouble.

## Try California Bulbs

Written for California Cultivator By E. Branton

**E**ACH year California sends away great sums across the sea to pay for what we term Holland or Dutch bulbs. For many years California growers in various parts of the state have been growing many of these bulbs with marked success. Especially is the industry flourishing from Santa Cruz northward to Eureka. It is claimed for many sorts of bulbs that the California product is much better than those imported from Holland and that the sizes of all sorts range larger. These bulb farms grow many of the finest varieties of tulips and narcissus or daffodils. We should make an effort to procure California grown bulbs only and if they are satisfactory, to thereafter purchase no others. Encourage home products.

### Garden Fertilizers

Gardens need more fertilizer than fields for garden crops draw heavier on the soil and usually more than a crop a year. Those in rural districts find it easier to fertilize with stable manures, and none are better. They are heavy in nitrogen, the most necessary and costly element, and contain plenty of potash. But they are low in phosphorus, containing only about one-fifth as much as of the other two principal constituents. Therefore stable manure needs the addition of acid phosphate or some other form that will furnish phosphorus. Try this method on the garden and you will note marked improvement in all plant life.

### Plant Freaks

Plant life resembles animal life in many ways that I have for years believed to the belief that these two classes of life differ only in that animal life has the additional powers of thought and locomotion. But freaks and cripples are common to all life. Some plant parts are doubled in number, wanting in whole or part, become misshapen, flouenced, or crested. Odd shapes, twin growths, one flower divided into several or several combined in one. Sometimes freaks are due to unknown causes. Insects and other factors may mutilate, soil conditions or excess of plant food may be responsible for departure from type. The point of greatest interest is that freaks and cripples in plants and animals are much alike in both cause and effect.

### Soot for Gardens

It is doubtful if there are any crops that are not benefited by application of soot. It may be regarded as valuable aside from fertilizer value. Soot may be used dry or in solution, turned under or raked in as mulch, but when intended for future use it should be kept dry. It may be applied to any crop at any time and while it will not generally injure foliage it is as well not to figure the latter with such deposits. Many gardeners claim that it always darkens the color of both foliage and flowers.

### Weeds in Paths

A saturated solution of carbolic acid will kill weeds in paths or prevent them from coming up and is probably the simplest remedy one can apply. Many gardeners often dissolve a pound of powdered arsenic in three gallons of water and two pounds of powdered arsenic. Boil and stir well while boiling and apply while hot to the weedy surface.

This is about right for 25 square yards of path or 75 feet of a path three feet wide, the most common garden width. It will also kill insects of all kinds and should be evenly distributed from a sprinkling pot with a rather coarse rose.

### Weed Killers

Experiments by the United States government with various weed killers brought the rather long list down to three fundamental materials: arsenite of soda, common salt, and crude oil fuel oil. These may be considered best for combating weeds in paths and roads. Lately I saw where an oil and sand roadway of 20 feet in width was cut down to a path of six feet in width, the oiled and caked earth being removed and a fine crop of blue grass grown. I am certain, from this closely observed case, that if paths are outlined with battens, oiled and sanded, that battens may be taken away and grass allowed to grow up to oiled surface and produce an effect second to none for effective and appropriate finish and harmony. Or battens may be left to rot away. Paths are in either case permanently splendidly outlined.

### Trees from Nurseries

When one digs a young tree in the wilds it is usually found to have a few long straggling roots with small feeders along the entire length. Nearly all these are some distance from the trunk. When the roots are cut some little distance from the common center nearly all feeders are cut off and the transplanted tree has a hard time becoming again established and in many cases perishes. Not so the nursery tree. It is dug and transplanted one or more times before being sold, so that diffuse root branching is encouraged. Even if never transplanted the care and culture is bent toward inducing a fine rooting system. It pays to buy nursery stock of nearly all sorts rather than to depend upon collecting from the wilds.

### Chrysanthemum Culture

See that plants are properly supported by stalks or wires strung between stout posts. If troubled with aphids or red spider spray with a nicotine solution. Pinch out the weak buds, or all buds on weakly plants and use later sets of strong buds on a stronger growth. With early sorts begin to choose your buds and disbud somewhat. Keep up a steady degree of soil moisture and feed your plants. A good heavy mulch of stable matter is at once a mulch and a food supply and is of heavy value right now. When buds show color stop fertilizing but keep up a good water supply until flowers are picked.

### Interest in Hardy Flowers

The term hardy flowers has a different meaning in California from that accorded the term elsewhere. With us it is not a matter of ability to stand frost but to cope with dry summers without irrigation. Except for "dandy" gardens, those that look as though they have been freshly barbered, shampooed and manicured, we all desire hardy material. Even the intense lover of plants gets tired of pampering and coddling and loves most those sturdy subjects standing out in full thrift in spite of adverse conditions. Let us use plant that do not have to be watched over on cold nights, hot days, or periods of heavy rain. Give us plants that thrive lustily under normal California weather. With the extensive use of this class we shall finally develop the true California garden.

### Best Deciduous Tree

For either park, garden, or street planting the best deciduous tree is the oriental plane, or the London plane. The latter is a cross between the western plane, *Platanus occidentalis*, and the oriental species, *P. orientalis*. These trees are hardy from the Atlantic to the Pacific if one does not range too far north. In California it surpasses in usefulness any other deciduous tree. Where long summer shade is needed, coupled with a short leafless period during the very coldest and wettest part of the year the oriental plane or sycamore has no equal.

## Fits Your Farm

### Does All Farm Work Without Horses

See for yourself how well the Moline Universal Two-Wheel Tractor **FITS YOUR FARM**. It *cultivates* as well as plows. It works on plowed ground without packing the soil. It is as easy to handle as a team of horses. It gets close into the fence corners, turns short and backs with tools attached. It is a real one-man tractor. You ride on the tool where you can see the work you are doing. You don't have to have someone run the tractor while you operate the farm implement, and finally, it **DOES ALL FARM WORK WITHOUT HORSES**.

### Costs Less Than 4 Horses Does the Work of 7 Horses

With all the advantages named above the Moline Universal Two-Wheel Tractor is also low in first cost and very inexpensive to operate. It costs you less than 4 good horses. When it comes to pulling it has the power of 5 horses and because it travels faster and never tires, it will actually do the work of 7 horses.

## MOLINE ORIGINAL 2 WHEEL UNIVERSAL TRACTOR

CULTIVATING

DRILLING

HARVESTING

will do anything you can do with horses and do it quicker, easier, better and with less hired help. Because all its weight is on two wheels—it has no dead weight to carry. All its weight is traction weight. It throws all of its weight into the pull. The tool you hitch it to forms the rear wheels. This gives two big advantages. **FIRST:** It does away with almost a ton of needless weight—which tractors of the 3 and 4 wheel types require. **SECOND:** It enables the operator to ride the tool instead of the tractor. In this way you can watch the work closely. You can turn short, get closer into fence corners than you can with a team and back with tools attached.

If you have an average farm of from 80 to 300 acres you will find this one-man, two-wheel, all-purpose tractor ideally fitted for your work. Don't buy any tractor until you have investigated the Moline Universal. Write for new Catalog Folder and read how this tractor is solving the hired help and power problems on other farms like yours. Write today.

**MOLINE PLOW CO.** Dept. 49 Moline, Ill.

#### OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

#### THIS WEEK'S COVER

Notice the little bunch, each doing his bit when photographed for use on the cover of this week's Cultivator. There is money in hogs and there is need for more of them and their products in this country. That need will apparently increase during the next year or two years.

#### LOCK UP THE DYNAMITE

The state council of defense is issuing warning to farmers, miners and others who may use explosives to keep them locked up. According to information reaching the state defense body, many tons of explosives could easily be secured by enemy plotters because of the failure of mining companies, ranchers and others to keep careful check upon them. Each county council of defense is asked to cooperate in seeing that the explosives are carefully guarded.

#### REDUCE

Note the closing paragraph on page 125, in Mr. Waterbury's article. He touches upon the effect of the hot wave, especially with reference to the citrus. The paragraph referred to appeals for reduction of packing house expense. Of course we know there will be loss from breaking up effective organization, but certainly the cooperative organizations are flexible enough to adapt themselves to conditions made by an "off year."

If 60 per cent, or possibly 90 per cent, of the navel crop is gone, certainly packing house and office overhead must come down or the growers must mortgage their places to pay salaries.

#### MORE COTTON

The Imperial Valley is making its greatest show of cotton. A few hours ride through that rich valley is

sufficient to convince anyone of its remarkable resources and of its ability to help feed and clothe the world. Thousands of acres of new lands have been brought under cultivation this past year. Now comes a still more ambitious plan which will bring another 200,000 acres "under the water." Some dairymen have seen their neighbors making more money from cotton than from dairying, and alfalfa has given way to cotton. There is difference of opinion as to the wisdom of this move. Only time can settle that point, but certainly the great need of the world for cotton guarantees a market for every pound grown this year. Besides, not a seed is lost, and the output of the Imperial Valley in oil and meal is a great factor in the world's foods and manufactures.

#### PERFECTLY SOUND

The report of the testimony before the investigation board, which had to do with the rumpus in the federal farm loan bank at Berkeley, was sent to Washington and after due deliberation it has been determined that:

"All questions of integrity of purpose have been eliminated and the bank is found in a perfectly sound condition.

"The affair will not be permitted to delay or impair the usefulness of the bank as an instrumentality of public service and that will be the chief consideration of the board in reaching its conclusion."

All of which could have been, and probably was, said before the committee left Washington to make this "investigation." The "sound condition" has been at no time questioned. There are conditions other than "sound" required before this institution can be the mighty factor it should be in feeding the world.

#### MORE BEEF

Mr. Spellmeyer's article on page 137 calls attention to a need of the country for greater production of meat producing animals. At the same time he calls attention to some of the unfair treatment which the meat producers receives. One of the points he makes is regarding the use of some of our idle millions which might be loaned to live stock breeders at a reasonable rate of interest and on long time. Cattle paper should be good, and the millionaire who is really patriotic might well spend a little time in finding means of placing his money where it would render most patriotic service.

Another point well taken by Mr. Spellmeyer is that a market is needed for Pacific Coast grown stock. This has been commented upon before in these columns. Why is it necessary for California to ship fat cattle and hogs to Kansas City? Is there not enough enterprise and capital on the Coast to handle this situation and handle it with fairness to the producers? As it is now California prices are materially lower than those of Kansas City, yet live stock is sent to Kansas City and shipped back to California as a finished product—which is neither right nor good policy.

#### NOT A FAILURE

Many of us who claim to be good farmers are able now to point at failures made in a few thousand backyard gardens which were planted because of the "produce more and re-

duce the high cost of living" campaign. There are plenty of absolute and more of indifferent failures in garden making.

But lest the "I-told-you-so" folks become too jubilant, let us remind them that the loss may not be as great as at first appears. Many a high school youngster whose highest ambition was to hold the steering wheel of an auto has this year learned the shape and general purposes for which a hoe was intended. He has done some work which has taught him a valuable lesson. He has not made a complete success as a gardener, but some time when the farmer is in sore need he may be able to train this formerly helpless boy to do effective work.

Again, there have been some cases of genuinely successful gardening, and that by men and women who knew not the name of the different tools which they were to use. Another year will show more of the successes of this year than can now be discerned. Let us be thankful for the garden campaign.

One more of its lessons we may be permitted to refer to, and that is that in addition to learning which end of a plant should be set in the soil many consumers have gained an inkling of the labor and expense required to produce food of merchantable quality that they themselves would be willing to pay for. This year they are certainly eating some queer looking specimens of their own gardening.

#### LOWER THE TAXES

We have been appealed to by all types of officials and all-round advisers to economize in our eating and in our drinking and in our dressing. The world needs the wool, cotton and all kinds of foods, and waste must be stopped. This has been dinged into us, and we believe most of us are obeying the injunction.

One place where economy will pull the hardest is in the realm of politics and municipal, state and national governments. In fact, we think it would be taken as almost a disloyal suggestion that some of the tax eaters might well be sent to the front and no one elected to take their places.

The Tax Payers' Association of California has made investigation and found that county expenditures for highways from the year 1912-13 to the year 1915-16 increased 69.62 per cent, and that during the same period the county expenditures for education increased somewhat over 27 per cent. During the same period the population of the state increased 15.33 per cent. No other expenditures of the state's funds could receive more general approval than those for education and good roads. Nevertheless, is the percentage of increase justified? If we are to economize even to the heel of the loaf of bread let's also economize in matters of county and state expenditure.

We notice that in Riverside County steps have been taken to lower the assessment and tax levies. This primarily because Riverside is a citrus county and citrus orchards have been seriously injured by the recent hot wave. The tax rate for the next year will be lower than it has been for the past ten years.

Why may not other counties in California follow Riverside's example?

#### Agricultural News Notes

New York's apple packing law attacked in the supreme court and been held to be valid.

Greece will produce 160,000 tons "currants." The holdover crop last year in addition is 20,000.

The New York State Food Supply Commission has purchased 40 tons. These will be loaned to responsible farmers for fall plowing.

The seventh annual rose show at the Tacoma, Washington, Rose Society, held June 29, 30 brought some wonderful new varieties.

Chicago poultry markets are, charged, being manipulated so almost prohibitive prices for dressed poultry are being charged.

The Ohio state horticultural society met recently at Chillicothe and adopted partial plans for a state apple show to be held in Cincinnati, November 17-23.

All exports from the United States are now under government control and license must be secured before shipment can be made outside of country.

Colorado has over 7000 honey producing farms. The beekeepers there are organized with a strong marketing committee and good prices are being secured.

The board of grain supervisors of Canada has ruled that after August the maximum price of wheat at Williams, Ontario, shall not exceed \$2.40 per bushel.

The Royal Horticultural Society of London held its usual annual show on June 5. The society's show has been taken over by the military authorities so that the show was elsewhere.

The official food commission of Norwegians, headed by Nansen, Arctic explorer, is in this country endeavoring to secure permits for ports of foodstuffs to their country. The commission gives assurance none of this food is destined for many.

The potato crop of Ohio has been severely damaged by blight because of weather conditions. The state agricultural college has advised spraying with a solution of four pounds copper sulphate, four to six pounds fresh burned lime, all diluted to gallons.

The National Apple Growers Association held their meeting this year at Niagara Falls, August 13 and 14. There was discussion of grading of apples, packing in more than one size, securing of cars for transportation and the labor problem. The president of the association is Henry M. Lap of Savoy, Illinois.

The winter wheat crop of the United States has astonished practically all farmers in producing a fair crop where it was thought to be almost a total failure for a time. Many farmers who plowed up and planted spring wheat are now regretting it because the favorable season has induced general stooling and a fairly good crop will be given in nearly all sections.

The commissioner of agriculture of New York has suggested to various county fair associations the awarding of \$250,000 of state money, usually given for premiums, direct to the farmers, the awards to be on the basis of crop yield per acre and excellence of crops, determination to be made by a committee which shall look over the crops and keep account of totals at harvest time.

# Agricultural News Notes of the Pacific Coast

## Northern California

Gridley City is to have free mail delivery.

Sutter County fruits are very late in ripening.

Alameda County is having a good roads campaign.

The Alameda County farm bureau has a free employment agency.

Buyers made contracts for 100 cars of peaches at Gridley, Butte County.

Oakland has a free market which represents an investment of \$350,000.

Early rice in Colusa County will be ready for cutting the first of September.

Humboldt County sheep growers are reported getting 62½ and 63 cents a pound for their wool.

Commissioner Gould of Yolo County has a number of men cutting star thistle on the highways.

The Humboldt County Dairymen's Association held its big annual picnic at Loleta Saturday, July 28.

A Humboldt milling company is completing a contract for 100,000 red-wood trays for drying raisins.

A new use is reported for rice hulls in Butte County. They are being used as a mulch around orange trees.

Grapes are ripening very slowly in Sutter County. Some contracts are reported at \$30 a ton for drying.

Farmers of the Palo Cedro district of Shasta County have organized an irrigation district to water 2000 acres of land.

It is announced that 75 per cent of the pear growers of the Sacramento Valley have joined the new pear growers' association.

The California Central Creameries Company at Ferndale has packed over 1,000,000 pounds of butter for the use of the United States troops.

There will be local meetings of the Glenn County farm bureau at Codora, August 13, 14, Jacinto 16, 17, Orland 20, 21, Plaza 23, 24, Elk Creek 27, 28.

A serious brush fire recently threatened a 45,000 acre grain field east of Sacramento. The fire was finally brought under control with only a few hundred acres destroyed.

Davis, Yolo County, reports the biggest grain crop in many years, with warehouses full and many thousand acres awaiting harvest because of shortage of labor supply.

A Mendocino County sheep raiser sheared 345 sheep, which averaged eight pounds wool which sold at 62 cents per pound. The best buck of the lot yielded 15 pounds.

People of Oroville, Butte County, are endeavoring to secure the establishment of the International Celulose Company. It will work up the sawdust and wastes of the mountains.

Experiments made in bean raising on the "second bottom" lands east of Elkhorn, Yolo County, have been so successful that it is predicted at least 20,000 acres will be planted to beans on such lands another year.

Representatives of milk producers' associations of California met July 28 in the office of the state market director in San Francisco to organize a cooperative association dealing with the general problems of the dairymen of California.

## Central California

The cannery at Exeter started on peaches July 24.

Salinas, Monterey County, has a new rural delivery route.

The cannery strike at San Jose was settled by a compromise.

Fruit packing plants at Atwater, Merced County, are working to capacity.

Fires in Patterson, Stanislaus County, recently destroyed large wheat fields.

Forest and field fires near Coalinga consumed hundreds of acres of pasture.

Modesto has a free employment bureau supplying workers on the ranches.

Central California newspapers are offering free advertising space to men out of a job.

Cantaloupes of the Turlock section are now commanding from \$1.90 to \$2.50 for standard size.

The sugar factory at Visalia is in operation and will have an output of approximately 100,000 sacks.

It has been suggested that owing to shortage of food it will be wise to can bass and trout of Tulare Lake.

The large barn and haystacks on the Whitten Ranch near Terra Bella, Tulare County, recently burned.

Horticultural Commissioner Beers of Merced County is serving notice to clear off all weeds from ditch banks.

Fresno fruit growers are planning to keep the soldier boys who go from that section supplied with fresh and cured fruits.

San Joaquin Valley irrigators are receiving a large supply of water from the Sierra Nevada because of last season's heavy snows.

The cannery at Hanford, Kings County, is now running on peaches and this year for the first time will put up a large pack of grapes.

The Modesto plant of the Pratt-Lowe Preserving Company has 400 employees at work. It has been putting out 50,000 cans of apricots daily.

Merced County harvesters are busy. The farmers are receiving \$2.00 and \$2.10 per cwt. for barley. The elevator at Merced is already filled to capacity, 4000 tons.

The Associated Raisin Company has raised wages for all men in its packing plants two and one-half cents per hour. The Associated prides itself on the fact that it has never had any wage trouble.

The newly formed Valley Fruit Growers' Association has 12,000 acres already signed up. Day wages paid by the Association during August will be 27½ cents per hour, 30 cents during September.

The state railroad commission has fixed rates to be charged by the Madera Canal and Irrigation Company. The rates are: October 1 to March 1, 50 cents per acre foot; March 1 to June 1, \$1.00; June 1 to October 1, \$1.25.

The Merced County farm bureau announces local meetings through August at Delhi August 11, Stevenson 13, Winton 15, Amsterdam 17, Livingston 20, El Nido 22, Le Grande 24, Merced 27, Los Banos 28. Humification of soil will be the principal subject considered.

## Southern California

Lemons are bringing big prices in Eastern markets.

Pomona is harvesting 2000 acres of potatoes.

Growers of fall crops of potatoes are busy planting.

The earlier walnut harvest will begin in August.

Hemet has just stored 23,000 bags of barley.

The recent hot spell did considerable injury to lima bean fields.

Imperial Valley's grape shipping season closed the last of August. One hundred carloads were shipped East.

Brawley, Imperial County, tried the experiment of shipping cantaloupes in bulk to nearby points.

The sugar factory at Chinio opened August 4, later than usual on account of the late cold spring.

The cannery at Placentia, Orange County, has been overhauled and supplied with new machinery.

The canneries at Hemet, Riverside County, in the week ending July 21 put up 700 tons of fruit.

Covina, Los Angeles County, women are discussing drying and fruit processing.

The board of directors of the Ventura County fair has been reorganized and is considering the holding of a fair this season.

Shortage of cars prevented the shipping of 2500 boxes of Valencias from the Fillmore packing house for several days.

Riverside and San Bernardino County beekeepers held their monthly meeting at Urbana Springs, San Bernardino County, Friday.

New kelp harvesters are being constructed and the output of potash and other products of kelp will be greatly increased during the coming year.

Governor Harding of Iowa will address the Iowa people at their picnic at Bixby Park, Long Beach, Saturday, August 11.

Imperial Valley was visited last week by heavy showers which caused some damage and stopped auto travel over its highways for some days.

With several hundred acres of apples coming into bearing next year the Devore Fruit Growers' Association contemplates putting in packing machinery next year.

A man who left a camp fire burning in the Angelus national forest was given a 50-day jail sentence, which was suspended on condition that he stay away from the forest reserve for a year.

Hemet, Riverside County, is discussing its future fruit crops. It produced this year about 9900 tons of apricots and is anticipating that within five years this will be increased to 23,000 tons.

Apricot growers in the Devore section have harvested a hundred dollars worth of apricots per acre from their four year old trees. The older groves have brought in four and five hundred. It is a bumper crop.

The department of the interior has closed the contract with Mark Rose for the construction of a canal from Laguna Dam which will carry water to from 120,000 to 200,000 acres of rich Imperial Valley lands.

## The Coast

Yakima Valley, Washington, will have a big fruit crop.

Yuma had a third of an inch rainfall the last week of July.

Bellingham, Washington, is marketing its record raspberry crop.

The Hood River Valley produced 1,250,000 barrels of apples last year.

In the first six months of the year Maricopa County, Arizona, shipped out 35,000 head of hogs.

Guernsey breeders of Clackamas County, Oregon, have organized a breeders' club.

Salmon canners of Washington will supply the government at regular wholesale rates.

Every state on the Pacific Coast has produced more potatoes than any preceding year.

The fruit crop in the Lost River district of Washington is very poor this year due to winter killing of fruit trees.

It is stated that every fruit district in the state of Washington will have one or more evaporators in operation this season.

The Southwestern Stockman Farmer is authority for the statement that Maricopa County, Arizona, is growing 125,000 acres of alfalfa.

Harvey Allred, Idaho's farm market director, is advising hay growers to hold for better prices as the hay crop for 1917 is short the country over.

The Wenatchee Valley, Washington, is having a big cherry season. It shipped 125 cars of apricots and will ship over 7000 cars of apples.

Bellingham, Washington, is having a fair cherry crop but anticipates short apple crop. Pears, plums and prunes will be a full crop.

The state of Washington proposes to grow its own cranberries and save \$600,000 now sent out annually for that fruit.

Call has been issued for the meeting of the Oregon State Poultry Association at the time of the state fair at Salem in September.

Three hundred dairymen of Snohomish and Island Counties of Washington have organized a dairymen's association.

Chandler cotton growers have organized a Citizens' Protective League to protect the cotton gin from agitators who have threatened to burn the cotton.

Farmers of Columbia County, Washington, have organized to protect their crops from incendiaries. Many anonymous letters have been received threatening to burn the crops.

The irrigation district at Horse Heaven, Washington, has bonded itself in the sum of \$18,000,000. About 250,000 acres will be put under water. The cost will be about \$47 per acre.

The Pacific Coast Nurserymen's Association held its annual session in Tacoma, Washington, the last week in July. M. McDonald of Orenco, Oregon, was elected president, C. A. Tonneson of Tacoma, secretary.

Twelve million pounds of wool are said to be stored in warehouses in Portland. For the first time buyers from the great wool markets of the East are coming to Portland instead of growers sending their fleeces to the markets.

# The Indigo Industry of the Philippine Islands

By E. D. Doryland, Agricultural Inspector, in the Philippine Agricultural Review

HERE are a variety of common names for the commercial few of the nearly 300 tropical species of the Indigofera—a genus of the leguminosae, so called because of the ability of some of its members to produce a glucoside indican from which indigo is extracted by a mechanical, solvent process. The old Sanskrit name for indigo, Indigofera tinctoria, until recently the principal commercial dye producer, is nili, or nila, while the old Latin name for the same plant is indicum, thus showing that as far back as Roman times it was recognized that indigo came from India, and was probably indigenous to that place. Doubtless, it was from India or some other neighboring country that the plant was first introduced into the Philippines.

The common names employed throughout the Philippines other than the English form "indigo," are anil, and tayom, or a similar name. Tayom is the name used on the Island of Luzon by the Tagalog, Ilocano, and Pangasinan peoples, and it is the rise and fall of the industry among these peo-

ple with which we are principally concerned.

Indigo in recent years yielded its once superlative position as a colorer of fabrics, to a product born of science, the anilin dyes of commerce, which became particularly aggressive about 1880. The creation of this benzol-anilin industry has delivered a lingering deathblow to an agricultural enterprise that was once a flourishing industry throughout Southern and Central Asia, Malaya, South and Central America, and to a limited extent in practically all other tropical, and some semitropical countries.

Only recently, since its most favored days, has the price of the vegetable indigo been such that it could be produced on a remunerative basis under Philippine conditions. This recent high price was brought about by the German dyestuffs being cut off from their old markets, and the vegetable dyes were used instead. Thus through the influence of the European war has indigo again become a source of profit. This recent boom is perhaps the last struggle for life of an industry that can only be made profitable where pitifully small wages are paid for labor.

This recent show of life of the vegetable indigo industry is perhaps the last, because the civilized nations of the world have received a severe lesson by having German dyestuffs shut off from them, and are now developing their own coal-tar dye products, so that in event of another world catastrophe these countries will not be dependent upon the vegetable product.

During the early days of the vegetable indigo industry in the Philippines the process of extracting the indigo from the plant was crude. Planting was done during the latter part of the rainy season, and if the ravages of locusts left sufficient foliage the plants were cut in May or June of the next year; after cutting they were placed in casks filled with water, then steeped; after steeping for several hours, usually 10 to 16, the plants were removed and a certain quantity of lime was mixed with the water for flocculating purposes; the solution was then poured into other casks where it remained until the coloring matter had completely precipitated;

as soon as this had taken place the water was drawn off and the indigo left to dry, after which it was cut into small pieces ready for the market or for home use.

As imperfect as this method of manufacture was the indigo brought a good market price and paid an excellent profit, sometimes as high as 90 per cent. This, however, was back in the days when 60 per cent of the people of Narvacan and Santa Catalina, Ilocos Sur, were engaged in home dyeing, and before the anilin dye of commerce penetrated to the farthest markets of the globe.

The Philippine indigo plant is rich in indigotine, but the crude process of manufacture of the dye made it rank second in quality to the indigo from other sources.

The market price in 1914 before the war began was 30 pesos per quintal, while its maximum price years ago was 100 pesos to 120 pesos, but this was during the "bonanza" years from 1864 to 1875, when the export ranged from 98 to 158 tons per annum, respectively.

In recent years a Chinese started a dyeing establishment in Vigan, Ilocos Sur, in which imported dyes were used, and this was the beginning of the end, commercially, of the indigo industry of the Luzon provinces, revived only by the recent strife in Europe, and doomed to certain failure again after the war. To attempt to revive this industry so as to compete with modern science would be like trying to reverse the hands of time, plainly an impossible task. However, the old concrete steeping vats and wells will remain, then as now, as landmarks of practically an extinct industry, that has helped to lay the foundation of many a fortune.

## STATE HEADLIGHT LAW

THE state headlight law is now in effect. H. A. French, superintendent of the state motor vehicle department, has issued a bulletin touching upon the features of the law. The principal portion is here given.

"At times and under the conditions in this section hereinbefore specified the headlights of all motor vehicles upon the highway shall give sufficient light to reveal any person, vehicle or substantial object on the road directly ahead of such motor vehicle for a distance of at least 150 feet, and shall also give sufficient side illumination to reveal any person, vehicle or substantial object ten feet to the side of said motor vehicle at a point ten feet ahead of the lamps; provided, however, that such headlights shall be so constructed or arranged that no portion of the beam of reflected light when measured 75 feet or more ahead of said lamps shall rise or shall be capable of being raised from the driver's seat, to more than 42 inches above the level surface on which the vehicle stands ahead of such vehicle; provided, further, that the term headlight, as used herein, shall denote any light, irrespective of its location upon the motor vehicle, the rays of which are projected forward, except sidelights of not to exceed four candlepower, and that the term 'beam of reflected light' as used herein, shall denote the approximately parallel focalized rays gathered and projected by a reflector, lens or other device; and provided further, anything herein to the contrary notwithstanding, that where there is sufficient light within the lateral boundaries of the public highway within any incorporated city, town or city and county, to reveal all persons, vehicles or substantial objects within said boundaries for a distance of 100 feet, no lights shall be required to be displayed on any vehicle while the same is not in operation, provided that the wheels of such standing vehicle nearest the sidewalk are located within six inches of such sidewalk."

## HOME-MADE POLISH FOR AUTO

For furniture or automobile bodies an excellent polish can be made by thinning down boiled linseed oil with turpentine. This should be applied sparingly to the clean surface with a cloth and should be rubbed briskly with a soft dry cloth or cotton waste. It is best not to use body polish on a car until the gloss has become dull.

Another polish recommended by automobile experts is made from one gallon of turpentine, three and one-half ounces of citronella oil, one pint of paraffine oil or light cylinder oil and one and one-half ounces of oil of cedar. When the finish on a car has become very dull the appearance can be greatly improved by rubbing with a mixture of cylinder oil and kerosene.

## ALFALFA IN KANSAS

One of the most complete reports we have seen on that greatest of all legumes is that of the Kansas state board of agriculture, "Alfalfa in Kansas." There are almost 500 pages in the book and hundreds of illustrations and charts. The bulletin refers to alfalfa as Kansas' greatest forage crop.

"Kansas raises more alfalfa than any other state. It is therefore fitting that the methods of our best growers be investigated and that the information thus acquired be disseminated throughout the commonwealth. To this end the state board of agriculture sent out nearly a thousand blanks, each containing 115 questions, to prominent alfalfa growers in every county in Kansas. The replies received from hundreds of these growers have been compiled and analyzed and the consensus of opinion on all the points and phases of the culture of alfalfa is herewith presented."

# Making the Dairy Pay

Written for California Cultivator By M. E. Bemis

**S**OME one may have written a book with the above title. In fact, I am almost certain that there is such a book, but as it most certainly did not apply to Arizona or California conditions, and as no other words so well express the story of this Salt River Valley dairy, I will take a chance of being accused of plagiarism in using the title.

When a man makes a herd of 40 cows produce an average of 328.6 pounds of milk for each cow, and in a cow testing association with more than 300 cows has five out of his 40 that are among the ten best individuals of the association, it makes one wonder if it is altogether chance that has brought such results.

Frank M. Wilkinson is the man and he lives and is raising a family on his farm about 12 miles west of Phoenix, Arizona, on the outer edge of the big Salt River Valley.

The story of his success in the dairy business is not so different from the success of thousands of other dairy farmers probably, because it is a combination of those essential things that go to make dairying profitable and therefore successful.

He was among the first of the dairy farmers to build a silo in the Salt River Valley. For two years previous to the organization of the cow testing association he had weighed and recorded the weights of the milk from each cow and tested about four times each year. Naturally he had weeded out the unprofitable cows so that when he joined the association he was not only continuing the work which had been done before. It was only natural that in this two years' work he had observed a good deal and done a good deal of earnest thinking, for he is the sort of man that thinks and then acts.

Along with the scales and tester and the silo, there was of course a registered Holstein-Friesian bull, for his herd is composed of grade Holstein-Friesians. He believes in good feeding, recognizing the fact that there can be no improvement of the progeny unless either the sire or dam be better than the sire and dam of a breeding stock. So he has built a foundation wisely and then rejects relentlessly those that do not come up to the requirements.

With his firm belief in the importance of breeding and the necessity for doing by systematic work, he believes that is only part of the important work of dairymen. In other words, he believes that the matter of feed is a great big factor quite as important as the others.

A quite common practice among the Salt River Valley dairymen is to turn the cows that are milking into an alfalfa field that is about in the last stage to cut for hay, and let them run on it until they begin to fall

off in milk flow and then change to another field that is in the same stage. The dry cows and young stock are then turned on the field vacated, to be cleaned up.

Here is where Mr. Wilkinson is different. He says, "One never loses anything by giving a dry cow as good as the cow that is giving milk. I have found that any fat you can put into a good cow when she is dry, you get back in the milk pail."

Now, if there is anything that he is doing which has contributed more to his success than any other one thing, possibly it is in the matter of feed, but as I pointed out at the beginning, it is a combination of all the important factors that spells success.

As to what he feeds, he says, "Silage and alfalfa makes almost a perfectly balanced ration" and he added, "I feed no grain to amount to anything."

Like many other farmers with silos, he has tried various kinds of forage for silage. Feterita he has found makes good silage, but he prefers corn to anything else. The variety of corn which he prefers is the same as that planted by the majority of the best farmers of this valley, Mexican June. The rotation which he advises is alfalfa six to seven years, then grain and corn for two years. In this way the alfalfa is kept up to its maximum, and the alfalfa sod when turned under makes an ideal soil for growing big crops of corn and grain. "Land that has been in alfalfa for a number of years will produce double the grain that can be produced on the same kind of land which has been continuously put in grain for a series of years," he said.

He has a milking barn with concrete floors and a milking machine. There is also a manure spreader, and there are not many of these implements in the Salt River Valley—more is the pity—but this only serves the more to show that Mr. Wilkinson is one of the progressive kind of dairy farmers.

Lots of hay is being put up for winter feeding, and every effort is being made to save the most valuable part of it. In the usual wholesale method of stacking hay here the buckrake plays a prominent part and incidentally breaks up a good deal of the fine stalks, loses a large part of the leaves and scatters considerable that is lost forever. On the Wilkinson farm the hay is cut and raked into windrows, then bunched with a horse rake. Floats which are like big stone boats, except that they are made of one inch pine plank, are used for hauling the hay to the stack instead of the cumbersome and wasteful buckrake. These floats will hold probably 500 pounds or more. A common hay sling is spread out on the float, a team hooked to one end, and two men with forks throw on the load in a very few minutes. The float is pulled to the stack and the team hitched to the pulley rope of the derrick stacker and the load pulled up over the stack very quickly and the most valuable parts of the alfalfa plant are saved without loss.

This is only one of many details that have been carefully studied out, but which have helped to make this the highest producing dairy herd in the two cow testing associations.

## Field Notes from the Live Stock Men

Geo. Hemming, chief herdsman for E. Nixon's Revada Guernseys, will have a great string ready for the state and other fairs this fall. He was with Frank Morgan's herd in England for years before he came to this country and had a lot of blue ribbon winners at the Island and London shows. He came over with J. L. Hope, in care of big importation of Island cattle,

and was afterward with Walter Dupee at Edgemor, whence he comes to Mr. Nixon.

Mrs. Eliza Shepard is continuing the policy of the late Jack London, her brother, in maintaining the splendid Shorthorn herd, the Shire stables, and the Duroc-Jersey herd at Glen Ellen. Mrs. Shepard is an enthusiastic stock woman, and Shorthorns are her fav-

orites. Roselawn Choice, senior grand champion bull at Sacramento last year, will be exhibited again this year. He is in fine condition. The Scotch cow, Pine Grove Secret, bred to Selection, a former International grand champion, and Sittytton Secret, the junior yearling bull calf, are two of the best in the lot Mrs. Shepard brought West last spring. However, London's Lavender Lady, a junior heifer calf sired by Roselawn Choice and bred by the London ranch, is going to be one of the hardest to beat in her class. She is nicely covered, back line straight as a string, is smooth and has remarkable character.

Geo. Sim, Scotch herdsman on the A. W. Foster Hopland ranch, is expecting his two year old heifer, Hopland Lass, to make her competition hustle for first money this year. She is a granddaughter of Ringmaster. Hopland Duchess and Hopland Mirth are two mighty good senior yearling heifers which go to Sacramento. The junior yearling bull, Hopland Lord, and a typey senior heifer calf are noteworthy Hopland fair selections. George has been a Shorthorn cattleman all his life from the time he roamed the heather in Aberdeenshire till he brought a shipment over to America for Frank Harding from whom Mr. Foster secured him.

C. S. Rasmussen, Humboldt County Guernsey breeder, has been getting some remarkable results with his dairy herd the past few years. One hundred twenty-five cows have averaged 300 pounds butter fat each for the last seven years. With the exception of less than six weeks around holiday time these cows never got a pound of grain. Gypsons Isabella 28978, made 590 pounds of 85 per cent butter at two years old. It would be interesting to know what this great cow would have done had she been fed a regular test ration. Mr. Rasmussen is in the county testing association but will soon be doing official work as his herd will compare favorably both in quantity and quality with the best. Glenwood blood predominates in this herd although it is strong in Ne Plus Ultra and the Masher and May Rose families.

Chas Rule, who ranges registered Hereford cattle in Sonoma County, is immensely pleased with his great young sire, Sonoma 62500, a Cook bred September, 1914 bull purchased at the Denver show last January for \$2000. He will get Mr. Rule some outstanding calves if breeding and individuality count for anything. He is by Beau Perfection 9th, a full brother to Woodford, the \$12,000 Taylor sire. Sonoma is Beau Donald breeding on his sire's side and Beau Brummel on his dam's side. He was champion senior yearling at the Denver show and won several blues at the Montana state and Spokane fairs last year. It is to be regretted that Mr. Rule was unable to secure a herdsman to fit a herd for the fall shows as his Anxiety bred stock would have been a welcome addition to the big beef exhibit at Sacramento.

## Your SILO

## Humphrey's First Annual Sale

Written for California Cultivator By C. A. Briggs

EXCEPTIONALLY fine young registered Berkshires, 30 of them were sold at public auction on the Escalon farm of A. B. Humphrey on August 2. L. E. Frost conducted the sale in his usual efficient manner. Brief opening remarks were made by Mr. Humphrey, who expressed the hope that as this was a farmers sale that the farmers in his immediate neighborhood would be able to secure some of the animals offered and assist him in making the Escalon district a Berkshire headquarters. Dean C. F. Curtiss, of the Iowa Agricultural College at Ames, gave a fine talk on the need for more and better hogs on all farms, and predicted 20 cent pork at an early date. The auctioneer, "Col." Seeley, was assisted in the ring by Mr. Frost who is to say the least, not "a frost" but a hot wave in getting after bidders. Together they make a full team. The auctioneer was new to Coast sales and the crowd liked him. He is a good one, all business and on the job every minute.

The animals sold were of high quality and found new homes in Oregon, Washington, Iowa and California. High prices did not prevail, but good was done in getting new meat started to raising the "snub nosed" ones. As the greater portion of the sales was of young stock with their days of usefulness all before them, the sale can be classed as a notably successful one. Mr. Humphrey made a fine host, taking the crowd before the sale in an auto trip over the farm and later serving a lunch of good things.

Homer Hewins, Jr. of Calistoga walked away with the highest priced animal, Escalon Artful Belle 4th, a sow of splendid type and breeding. Other buyers were Dean C. F. Curtiss, Ames, Iowa; F. R. Steele, Grant, Pass, Oregon; Charles M. Talmage, Newport, Washington; E. L. Thompson, Tipton; Jos. Levy, Manteca; Geo. A. Stingle, San Gabriel; T. G. Meckfessel, Hanford; L. Cole, Oakdale; Napa State Hospital; F. A. Brush, Santa Rosa; W. M. Carruthers, Mayfield.

Left to right, Col. Lloyd L. Seeley, auctioneer; L. E. Frost, sales manager; R. P. Royce of state farm, Davis.

Familiar Faces Seen at the Carruthers and Humphrey Sales  
Left to right, W. M. Carruthers, San Francisco; F. A. Brush, Santa Rosa; Dean Curtiss of Iowa Agricultural College.

## Carruthers Second Annual Sale

Written for California Cultivator By C. A. Briggs

AT Mayfield on August 1, a notable public sale of Berkshires took place. Twenty-eight head of registered hogs belonging to W. M. Carruthers sold to buyers from a dozen towns and four states for \$4975, an average of \$177 a head. The usual auction crowd was absent, but a small number of keenly interested buyers kept the auctioneer, Lloyd L. Seely of White Hall, Illinois, on the move. The veteran editor and expert ring man, L. E. Frost, who knows Berkshire hogs in every line, point and possibility, assisted in the ring. What would a Berkshire sale be without him? He opened the sale introducing the speakers in the follow-

ing order: Dean C. F. Curtiss of the Iowa Agricultural College at Ames, president of the American Berkshire Association, who paid compliments to the breed and breeders as he had found them in a trip through the state, to the ability of Mr. Carruthers and to the sale offering which he said was among the finest that he had ever seen. A. B. Humphrey of Escalon spoke of the need of all fruit farmers keeping stock to maintain the fertility of orchards and vineyards. F. A. Brush, banker, big farmer, stock man and breeder of Santa Rosa, won applause by his remarks about his chosen breed. Charles M. Talmage, a big man in every way, from Newport, Washington, gave a practical talk that

was followed with keenest interest. The "Colonel," Mr. Seeley, hammered his points into the "pulpit" and his keen eyes never missed a bid. The "top notcher" of the sale, a magnificent boar of splendid breeding, Mayfield Champion 223391, was knocked down after a hot fight to Charles M. Talmage of Newport, Washington, for \$1175. Mr. Talmage has since sold him at private sale to Dean Curtiss for \$1500. He goes to Ames, Iowa, the home of good hogs.

Mrs. Carruthers, assisted by a small battalion of ladies, served a fine lunch at noon which was appreciated by all. The buyers were Chas. M. Talmage, Newport, Washington; Dean C. F. Curtiss, Ames, Iowa; F. A. Brush, Santa Rosa, who purchased the highest priced sow, Rookwood Lady 100th, for \$585; F. R. Steele, Grants Pass, Oregon; H. P. Murphy, Perkins; Chas Turner, San Jose; Hopland Stock Farm, Hopland; John M. Ratto, San Francisco; A. B. Humphrey, Escalon; V. A. Schellar, San Jose; F. N. Woods, Jr., Menlo Park; Merrill & Sons, Morgan Hill; W. H. Saylor, San Francisco.

## A Guernsey Club Organization Meeting

Written for California Cultivator By C. A. Briggs

On Saturday, August 4, a number of the leading Guernsey breeders of the purpose of discussing the advisability of perfecting an organization to make

The Makin's of a Butter Factory

state met at luncheon at the St. Francis Hotel, San Francisco, for the the breed better known. It was found that there were about 600 head of

registered animals in the northern part of the state, the bulk of them being represented by the owners present at the meeting. It was decided to organize under the name of Northern California Guernsey Cattle Club for the purpose of fostering and promoting the interests of Guernsey cattle and Guernsey breeders. B. E. Nixon of Napa was elected president; W. H. Saylor of San Francisco, vice president; A. J. Welsh of Redwood City, secretary. The officers, together with M. H. Tichenor of Palo Alto and M. A. Harris of Redwood City, were made the executive committee. Dr. J. W. Henderson of Berkeley and Prof. Gordon H. True of the university farm at Davis are among the charter members of the club. It is the intention of the club to make this excellent breed of cattle better known, and a most earnest spirit was manifested by all who were at the meeting.

As a rule, when hogs are lot fed practically all the manure is lost. There was never a time when manure was worth so much as it is today, and every effort should be made to save it.

### FIRST FIGURES ON WOOL SUPPLY

**F**OR the first time in this or any other country a survey has been made of the wool stocks on hand, and the figures representing the holdings June 30, 1917, have just been made public by the bureau of markets of the United States department of agriculture. According to this summary there are 370 million pounds of grease wool in the hands of dealers and manufacturers who reported; 47 million pounds of scoured wool; 29 million pounds of pulled wool; 23 million pounds of top; and 18 million pounds of noil. About 56 per cent of the grease wool, 62 per cent of the scoured wool, and 45 per cent of the pulled wool was reported by manufacturers, and the remainder by dealers.

An effort was made to obtain information from all dealers and manufacturers in the United States who had wool, tops, and noils on hand June 30, 1917. Approximately 2,200 blank forms were sent out and only 54 firms failed to return these schedules. About half of the total number, or 1,138, indicated that no stocks were held. Many of the latter reports, however, were from enterprises which, though listed in wool trade directories, do not carry stocks of wool, and others whose stocks were included in reports received from central offices.

Six grades are reported, ranging from fine combing and clothing wools down to carpet wools, all the latter being of foreign origin. Even without these carpet wools, the stock of domestic wools now held is less than the foreign.

Since these are the first figures of the sort, the department says it does not feel justified in making any statement as to the relative size of the supply on hand. It is assumed, however, that the war is making unusual demands on the wool supply. Comparisons can be instituted when future reports are issued. The next survey will be made September 30, 1917. Each succeeding one will give a comparison as to all classes and grades of wool, tops, and noils, both foreign and domestic, held by dealers and manufacturers.

One strong argument in favor of hogging down corn is that it returns the manure directly to the land.

## an everlasting STOCK TANK

Pacific Stock Tanks are built for keeps—they last longer than any other—they're built of Redwood.

Redwood was unknown before the settlement of California, hence no man now alive knows how long a Redwood tank will live. But there are tanks in use in 1917 which were built in 1859, and still show no evidence of decay. Neither heat, cold, desert dryness nor tropical dampness affect Redwood.

We have been building Redwood tanks for 30 years—for farmers, stockmen, mines, railroads and municipalities. Our organization is highly trained—skilled by long experience—and proud of the results achieved.

Tell us of your needs, whether large or small, and our engineers will give you the benefit of their knowledge freely.

Redwood costs much less than steel and lasts many times as long. It weighs far less and that saves freight.

Why pay \$165 for a 5,000-gallon steel tank when you can get a Pacific Redwood tank for \$58.00 that will outlast three of the others?

**Pacific Tank & Pipe Co.**  
318 Market Street

## Breed Leaders

Every breed of live stock has its outstanding character the same as the human kind. A great dairy cow has proved her ability to produce anywhere up to 15 tons of milk annually; the trotting horse has secured his record around two minutes; the beefmaker has shown his ability to make the least amount of feed into the greatest amount of food; swine, sheep and others of the live stock family have shown themselves great characters. In addition—and here is where their worth is proven—these animals can transmit their productive power to their offspring.

Beginning with the issue of August 4 the Cultivator gave an account of Pietertje Bloom of the university farm dairy herd. Some things she has done and more that her daughters have done were chronicled. She was a most worthy leader in this series of articles. Others of her kind are to follow. This week we touch upon a great pork maker. More of the "handsome is as handsome does" type of animals will be given in the columns of the Cultivator during the next few months.

## Lamb's American Beauty

Written for California Cultivator By C. A. Briggs

**A** GOOD mother, a good nurse, large litters of strong well built pigs, plenty of milk to eat. These are things that one should be able to say of a first class sow. Lamb's American Beauty, a splendid Duroc-Jersey owned by Elmer Lamb of Ceres, fills the bill. Her breeding, her show ring record and her performance as a mother

and champion bred by exhibitor at the Panama-Pacific. This is the pedigree record that has made her what she is: Sire, Modesto King, winner of California State Fair first, three years in succession; great grand sires Hanley, the first boar of the breed to sell for over \$1000, and Tip Top Notcher, a 1000 pound junior champion at the St. Louis Interna-

A Leader

Lamb's American Beauty, grand champion at state fair, 1914, sweepstakes at Fresno, 1915, second in class at P. P. I. E. Owned by Elmer Lamb, Stanislaus County.

all entitle her to mention among the breed leaders.

Facing strong competition she won second in class at the Panama-Pacific International Exposition, sweepstakes at Fresno 1915, and was grand champion at the Sacramento State Fair in 1914. She is a full sister to Bettie A 2nd who was junior champion, reserve grand champion,

tional Exposition. Her dam, Bettie A, was sired by Hoosier Lad, one of the best, bred by P. M. Barker of Thornton, Indiana. About all the good points that any sow can have belong to this one. A full blocky style with sufficient length and depth, good hams, good heart girth, standing well on her toes, with every fancy point well toward perfection. Mr. Lamb did well when he bred her.

## Fine Durocs on Conejo Ranch

Written for California Cultivator By R. K. Walker, Secretary Southern California Duroc-Jersey Association

Southern California received another boost towards establishing its record of being the greatest Duroc-Jersey section in the West, when the Janss Investment Company of Los Angeles imported from the Middle West a whole carload of the choicest

Durocs to their Conejo ranch.

This ranch is under the management of Mr. Braly and he has secured the services of E. N. Manley of Lyons, Nebraska, to handle this top Duroc herd. Duroc men will recall the class of Durocs showed by the Manleys at the recent worlds fair at San Francisco.

In visiting this herd last week I was impressed with the uniformly big type of his mature sows; his six and seven hundred pound sows were as active as yearlings and all of them showed that uniformly perfect back and feet and legs so characteristic of the Golden Model family. Most of these animals are sired by or out of dams by Golden Model 31, and several are sired by or bred to the famous boar, Critic D. In this breeding the Conejo ranch certainly has a combination hard to beat.

This herd will probably make the shows this year and will certainly be heard from. Their aged sow by Dusty Critic is sure some sow, being of the extreme big type with perfect feet,

legs and back. There is a junior yearling sow there bred to Golden Model 31 that would make a judge in any show take notice, one of these big high stretchy animals with plenty of quality. They have two junior yearling boars, both sired by Critic D and out of Golden Model 31 dams. One of these, especially, weighing close to 500 now is going to look well by fall.

This herd will be a big help in making the Riverside Fair, October 9-13 the great Duroc show which the Southern California Duroc-Jersey Association is planning.

### POINTS IN FEEDING GOATS

The following points on feeding goats are from an article by Holmes Pegler, an English authority, and should be of especial interest now when so many people are considering the feasibility of acquiring a goat for supplying the family with milk.

"The goat keeper must bear in mind three important points in feeding his stock. The first and most important consideration is absolute cleanliness, both in the food itself and in the receptacle for it. The best form of receptacle is a metal pail; wooden mangers are objectionable as they get gnawed away and are more difficult to keep sweet. The second point is that variety of food is essential; no animal tires so quickly of the same food as the goat, and it will soon give up eating if a change is not provided. The third point is one of economy. If the goat is fed carelessly, without due regard to its tastes or capacity, it may cost as much as its return in milk is worth; thus hay may be wasted to any amount if thrown on the ground or if placed in the hayrack in needlessly large quantities. In order that this fodder may not be too easily pulled out and only tit-bits consumed, it is necessary that the bars of the hayrack should be not more than one and a half inches apart. A still more economical plan when hay is scarce and dear is to give it only in the form of chaff mixed with oats and bran. Oats again will be wasted if mixed with the residue of the previous meal. Bran is best given by itself, either dry or still better as a mash. It may be added to chopped roots or potatoes, but never to grain, since to obtain the grain more readily goats will often blow away the bran. Middlings or sharps may be given instead of bran for a change with chopped vegetables.

From their kid stage goats should be encouraged to eat all vegetable waste from the kitchen, or household scraps, such as broken bread, bits of meat, boiled potatoes, etc. In the garden there is scarcely any plant which is not acceptable. The greatest care should be taken, however, to prevent goats from eating such more or less poisonous shrubs as rhododendrons, yew, privet, and laurels. When the supply of garden produce fails, swedes and mangolds should be purchased if they can be obtained at reasonable prices. To save trouble to the attendant, and also to keep the goat occupied, these roots are best given whole, after careful washing, but they may be chopped into "fingers" as for sheep. In the former case the goat will scoop out the flesh, leaving the outside skin as a shell.

In summer, grass may be cut and supplied instead of hay; this is the most economical way of utilizing it. People who live in the heart of the country can take a goat along the lanes for a walk like a dog, allowing it to nibble at the roadside as it goes along.

**Warranted to Give Satisfaction.**

### Gombault's Caustic Balsam

**Has Imitators But No Competitors.**

▲ Safe, Speedy and Positive Cure for Curb, Splint, Sweeney, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunions from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is warranted to give satisfaction. Price \$1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address: The Lawrence-Williams Co., Cleveland, O.

Send 25c for a Trial Package of

### CARBOLA

Have you ever used Carbola—learned from actual experience how easier it makes your work and what satisfactory results it gives?

Why not do so now? Get a trial package for 25 cents delivered to you by parcel post. Contains enough Carbola to cover 250 sq. feet. Carbola will save you hours of time and labor, because it paints and disinfects at one operation, is always ready for use and easily applied. Just add water and put on with brush or sprayer. Never clogs the sprayer. No going to town for lime or bother of mixing and straining.

Use it instead of whitewash in stables, poultry houses, cellars, etc. Carbola is a mineral paint combined with a germicide 20 times stronger than Carbolic Acid, but not poisonous or caustic. Has no disagreeable odor. It dries a snow-white—not dark or colorless. Kills lice, mites, fly eggs, etc. Prevents contagious disease germs from getting a start in flocks or herds. One gal. covers 250 sq. ft.

## More Beef Needed

Written for California Cultivator By A. L. Spellmeyer

**P**OPULATION is increasing faster than the supply of cattle. Livestock is a basic industry on which the permanent prosperity of the country depends. In war times there is an extra demand upon cattlemen to do their duty in raising and finishing feeders and beef and safeguarding the future supply.

A cattleman has one of the most difficult occupations, for to make a

and grain. It is discouraging to realize the ignorance of the first economic principles shown by some of our best and most prominent citizens who urge food conservation in small matters and overlook the waste of excellent grass which can be made so easily into meat fat. One man of prominence, I have in mind, is urging food conservation and has lying idle in California enough grass land to fatten a thousand steers. Much land

pay interest and be paid back.

In California there has not been enough meat demand to take care of the beef produced in the state. Thousands of cattle have been shipped to Kansas City during the last year to secure the better prices there prevalent, but the fat on many thousands of other cattle would not stand such long shipping, so those cattle remained unsold in California, the fat wasted and became lean again, and another good grass season must come before they will be fit to kill. It would seem that there was a great opportunity in California for a great meat canning establishment. Califor-

demand of the cities of San Francisco and Los Angeles not considering the balance of the state or other states. Neither the public nor those who represent them know that while beef is high feeders and stock cattle are cheap, and the producer of yearlings and stock cattle on whom the development and increase of the livestock industry depends is today securing considerably less profit than before the war. Expense has doubled and yearling steers are the same or less in price than a year ago, the bulk of last spring's actual sales being considered in Arizona and California.

Wonderful Producers of Beef  
Herefords on D. O. Lively Stock Farm near San Francisco.

cow man takes many years of experience and effort; many thousands who try the business fail. In the entire Southwest the standards of efficient breeding, grazing and beef finishing are set by comparatively few men who are increasing their herds to meet the demand for the millions of yearling steers and stock cattle absolutely vital to the Middle West farmer and the Northern grazer.

It is indeed patriotic to increase the supply of meat, meat fats, hides and other products so badly needed.

California is a country which can raise stock cattle and also fatten them, and every head of beef from grass makes available more forage

now lying idle could be made to produce more meat fat from cattle and sheep than the most economical stinting and saving of thousands of families.

What more patriotic use could be made of a hundred million dollars than to loan it at six per cent to the livestock men of this country on a basis of five years time? It is vital to maintain and increase our livestock. To develop ranges, fence and improve so that better methods will enable more stock to be carried and fattened, take money, and six months money now prevalent will not accomplish the purpose. Besides, this hundred million would not be spent, but would

nia livestock prices are cheaper than in Kansas City or Chicago. It is said that at present California meat canners cannot commence to supply the local

### LIVE STOCK AT RIVERSIDE COUNTY FAIR

Secretary R. L. Tabor of the fair management writes: "A stock show without any equal is what the management of the Riverside County Fair, October 9-13, has scheduled for this year. With cash premiums much larger than ever before in the departments devoted to horses, cattle and swine, exhibitors of blue ribbon stock from Eureka to San Diego will be present.

"The National Duroc-Jersey Record Association has recognized the Riverside fair this year and will give a beautiful silver trophy for the best litter of four Duroc-Jersey pigs.

Jersey breeders are being encouraged to exhibit this year by premiums offered by the management. The Riverside Jersey Breeders' Association offers special cash prizes to juniors exhibiting grade Jersey heifer calves.

"Boys and girls interested in Guernseys will find it much to their advantage to select the best grade female calf under one year. It is to the young people as well as their fathers and mothers that the Riverside fair is catering this year.

## Look Out for Stock Poisoning Plants

**U**ST now there is special need for stockmen to watch out for stock poisoning plants. It is when food is scanty and animals underfed that they are most likely to eat injurious plants, and most California ranges are now so heavily stocked that stockmen need to be alert for this danger. Care should be taken not to confine stock to small areas if poisonous plants are present. Water and salt should be made available at reasonably frequent intervals.

The California species of plants that cause stock-poisoning are not numerous, reports Professor H. H. Hall of the University of California, but a few are responsible for very heavy losses. Water hemlock does its greatest damage in summer, especially where tule swamps have been burned off and sheep admitted. This plant is prevalent also along creeks and sloughs in northeastern California.

Most of its poison is in the thick rootstock, which is chambered (unlike wild celery and other harmless plants with which it is often confused). Much loss may be avoided by proper methods of herding or fencing, and by eradicating water hemlock around watering places.

Lupines may be profitably fed if used in moderation, but they are sometimes a menace in summer and autumn if eaten when the pods are full of seeds. They may be eaten without harm before the seeds form or after they have shelled out of the pods.

Milkweeds are injurious to sheep when closely herded, or on long drives. They should be cut down and allowed to dry before the sheep reach them or the flocks should be driven by another route.

Death camas and larkspur are injurious, but the dangerous season for these is now nearly past, except in the mountains.

## TO REDUCE FEEDING COSTS

Continued from Page 123

grains in the ration, but until this is done it seems better to go by what has been and is being done on many large commercial ranches, and I think that they can be found in large numbers where but little corn and less wheat has been used for more than two years. I trust that this may help some brother poultryman to reduce his feeding costs, while I fear the reverse would be true in attempting to follow the ration previously referred to.

\*\*\*

Touching upon the same question or, rather, answering a question which has come in from a subscriber; Mrs. Koethen refers to the same article to which Mr. Ross has replied. From her first sentence it might be assumed that there is radical disagreement between her point of view and that of Mr. Ross, but we think careful reading of both articles will show they are not at variance. Mrs. Koethen says:

Mr. Quisenberry's article entitled "A War Time Poultry Ration," on page 70 of the issue of July 21 should be carefully read by every poultry keeper. The mash formula given could hardly be improved upon, at present prices, though the use of oat chop in place of bran would be just as good and just as cheap. The scratch feed, however, which is cracked corn and nothing else, is better suited to Missouri than to California. Corn is extremely dear and is not suitable for a steady diet in this warm climate. If a sprouted grain is used (either barley or oats) milo alone might be used for the dry grain. Feed men now are selling what is known as "mixed feed," a combination of milo, oats and a very, very little cracked corn. This, with sprouted barley for the morning meal, makes a good evening scratch feed and is comparatively cheap. Now more than ever before we need to heed the admonition,

"Feed what you have or what you can get for least money." If you have undersized potatoes or other vegetables such as turnips, carrots or cabbage, which will not bring much in the market, use them for the chickens and save grain.

\*\*\*

Continuing the same subject we have a letter from M. C. Sayer, which was referred to Mr. Ross, and he adds his comment. Mr. Sayer writes:

Will you please tell me what you think of the following dry mash: 60 pounds rolled barley, 60 pounds heavy bran, 30 pounds fish meal, 3½ pounds dry green bone, 5 pounds soy bean meal, charcoal being kept in separate hopper. The grain feed has been milo and rolled barley, equal parts by weight. The birds have done well on it but I had a lot of swelled heads and could not locate the cause as there were no cracks in the back of the house or ends, the front is boarded up about half way with a hip roof, plenty of scratch litter. Am inclined to think the barley caused indigestion and weakened the less vigorous ones. They would stand around half dead and seemed too lazy to move. Spraying is done once a week, so I am certainly up against it for fair.

Mr. Ross replies: Replying to your letter of the 31st, ult. and Mr. Sayer's enclosure, would say that my first criticism of his mash would be the use of the rolled barley as I think it enables the birds to pick it out too readily. Should use ground barley instead and then each bird would have to eat all the ingredients in the mash, which would not be the case when they could pick out the rolled barley and leave the balance, thus defeating the attempt to give them a balanced ration.

I should think this mash deficient in fat and that the use of so much barley gives a rather high fiber content.

I have hastily figured the composition of such a mash, calling it as 38 per cent each of ground barley and heavy wheat bran, 19 per cent of high grade fish meal, three per cent of soya bean meal and two per cent of bone and find it runs about as follows:

Moisture .....	10.39
Ash .....	7.76
Digestible Protein .....	19.43
Dig. Carb-Hy. ....	41.31
Crude Fiber .....	6.79
Digestible Fat .....	3.05

This would give a nutritive ratio of about 1:2.47 for this mash and as Mr. Sayer does not state the proportions of grain and mash that he feeds, but if he uses a scratch of equal parts, by weight, rolled barley and milo, and feeds an equal amount, by weight, of scratch and mash, it would give his ration a nutritive ratio of 1:3.88, while 1:4.65 is about what is considered proper for Leghorns in California.

I would suggest his changing his mash to get a higher fat content, say not less than 4.50 digestible fat, and if he does this by reducing his bran and barley he will likely get rid of some of the surplus fiber.

I doubt whether the feed has had anything to do with the "swelled-head" he complains of (although certain individuals may have "hogged" so much of the rolled barley for the mash that the excess of carbohydrates and fiber may have had a tendency to cause liver troubles and so weakened the birds and made them susceptible to colds which undoubtedly started the other trouble. I suppose that he feeds plenty of green feed, such as alfalfa, kale, lawn-clippings or the

like, as this is absolutely essential, especially where birds are confined in yards and fed such forcing rations as we use when after commercial eggs, and for that matter it is just as essential when after hatching eggs, and I have come to feel that if a poultryman cannot get an abundance of succulent green feed he had better stay out of the business.

I am aware that some think they can substitute alfalfa meal for "green feed" but I do not believe it and I consider soaked or steamed alfalfa hay a poor substitute for the succulent green alfalfa, although better than nothing if we are not well provided with green barley, beets, or some similar feed in the winter when we cannot get our alfalfa to grow. In feeding barley as a grain feed I prefer the whole barley to having it rolled, and I have never seen any trouble that I could really lay to the beards on the grain as it comes from the thrasher. However, it is probable that re-cleaning, or even "scouring" can be resorted to and still give us a grain that will be cheaper than any other we are likely to get this season. I trust the information here given may be what you need but if not will be glad to supplement it if I can be of any further assistance.

## INTERNATIONAL EGG LAYING CONTEST

Storrs, Connecticut, July 25, 1917.—Report for the thirty-eighth week ending July 24, 1917.

The Leghorns in the laying contest are hammering away in fine style. They were largely responsible for an increased yield of 50 eggs as compared with the preceding week and of more than 30 eggs over the corresponding week last year. The Leghorns constitute 38 per cent of the birds entered in the contest but last week they laid 50 per cent of the total number of eggs. No pen of Rocks, Reds, Wyandottes, Orpingtons or Campines laid over 50 eggs for the week but 14 pens of Leghorns were able to pass this mark. The total yield for all pens was 3957 eggs.

The three best pens in each of the principal varieties are as follows:

### Barred Plymouth Rocks

Fairfields Poultry Farms, 1606; Merritt M. Clark, 1388; Michigan Poultry Farm, 1331.

### White Wyandottes

Merrythought Farm, 1460; Joseph Moreau, 1302; Obed G. Knight, 1299.

### Rhode Island Reds

Allan's Hard to Beat Reds, 1485; Hillview Poultry Farm, 1391; Geo. W. Harris, 1381.

### White Leghorns

A. P. Robinson, 1721; J. O. LeFevre, 1542; Hilltop Poultry Yards, 1539.

### Miscellaneous

Cloyes & Sullivan, (Buff Wyandottes, 1417; Holliston Hill P. Farm, (White Rocks) 1360; Obed G. Knight, (White Orpingtons) 1304.

## CLEANLINESS—FREEDOM FROM LICE

Every effort should be made to keep the coops and houses clean and sanitary. Disease most frequently starts in unclean, poorly ventilated houses. The house should be cleaned at least once a week. Sand or litter of some kind should be scattered over the floor of the house to assist in keeping it clean. When chicks are confined to a limited range the ground should be spaded up at frequent intervals to provide fresh ground for them to scratch in. Chicks should be examined frequently to see if they are infested with lice. When lice are found every effort should be made to get rid of them by applying a small portion of a mixture of equal parts of vaseline and lard to the top of the head and around the vent.

# Science Says Buttermilk

Is the only preventative for White Diarrhoea. It further states that many birds that are apparently in perfect health have the germs in their system and that these germs are transmittable from both male and female to their progeny. Reference Bulletin No. 162—issued by the Department of Agriculture, Berkeley, Calif. Write Berkeley for this bulletin.

Don't take any chances, use Globe "A-1" Buttermilk Mash. It prevents White Diarrhoea, it increases the appetite, it aids digestion, it produces more eggs for market and better eggs for hatching and it costs No More than other good mashes.

It's the Lactic Acid in Buttermilk that does the good work. The dry buttermilk we use, chemically shows 10,000 Live Active Lactic Acid Bacilli to the cubic centimeter. Write us for Free Literature and sample of this wonderful feed. Not an ounce of filler used. Satisfaction guaranteed or money refunded.

**GLOBE MILLS, Los Angeles**

## for your VACATION

Wheeler's Hot Springs offers to the pleasure, rest and health seekers one of the most attractive mountain resorts. The good auto roads and hotel and camp accommodations are complete. Make reservations now. Free circular.

**Wheeler's Hot Springs, Ventura Co., Cal.**

Raise Rabbits For Us—We sell you foundation stock and buy back what you raise, paying \$1.75 and \$2.00 each for them. Send 25c for our proposition, our book on rabbit culture and our supply catalog. Gilmore's Rabbit Farm, Dept. C, Santa Barbara, Cal. (The rabbit farm of international reputation.)

"The Western Rabbit Book" containing everything pertaining to the rabbit business. 15 chapters, illustrated. Price 50c. Mrs. C. A. Richey, 616 N. Benton Way, Los Angeles, Calif.

HOW TO FEED HENS IS TAUGHT IN SHORT COURSE

How to feed hens is to be taught in a six-weeks short course in poultry to be given by the University of California at the university farm at Davis from October 2 to November 14, short courses being in progress at the same time in agriculture, horticulture, and dairy manufactures.

Results of experiments indicate, says the University, that it makes little difference what kinds of feeds are fed to laying hens so long as the ration contains some animal feed, has an approximately correct nutritive ratio, and has the feeds properly proportioned in the ration. How hens are fed is just as important as what they are fed.

Students will be taught how to hatch, rear, feed, breed, and care for fowls. Instruction will be given also in practical carpentry work in building poultry-houses and making coops, nests, hoppers, crates, etc. Demonstrations will be given of the best way to grow such crops as alfalfa, rape, kale, beets, etc., for green feed for fowls. There will be instruction in how to irrigate crops, plow and handle soils of different types, and operate, repair, and care for such farm machinery as gasoline engines, bonecutters, field tools, and keep a clear, concise set of accounts which will show him the exact cost of operation of every branch of his enterprise.

A PROTECTIVE ASSOCIATION FOR POULTRYMEN

Poultry stealing seems to be becoming more prevalent each year, says C. S. Anderson of the Colorado agricultural college. With the rapid advance in prices of poultry and the feeds necessary to produce it, many poultrymen cannot afford to have the results of a season's work disappear in a single night.

The idea of a poultry protective association has been proving effective in some Eastern sections. The poultrymen in a locality, usually adjacent to some town, become members of the association. A nominal fee of two or three dollars is paid annually, and a permanent metal sign indicating their membership is given them to be placed on their poultry houses or yards. This shows would-be thieves that the poultry in these particular yards is under protection.

At the very first case of a member being robbed of his poultry, the most severe methods are followed to hunt down the thief and bring about his prosecution. Some associations maintain bloodhounds for their immediate use as soon as a member reports a loss.

After one or two thieves have been made an example of by prosecution, the associations usually have very little further to do. The annual fee can be reduced after the first year, for the membership in the association will naturally increase and the difficulty with thieves will be greatly overcome. The very presence of the association then serves as sufficient protection.

## The Cultivator Patterns

8439—Children's Dress. Cut in sizes 2, 4, and 8 years. The dress is cut in one piece and is plaited at the front and back.

8467—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. The long sleeves are finished with cuffs.

### SPEED UP!

By Clinton Scollard

Speed up! Speed up! we say;  
Danger lies in delay;  
Let it be ours to strike ere we are stricken!  
Lest we be forced to sup  
Some bitter cup.  
Lest perils round us thicken,  
Speed up! Speed up!

Speed up, lest we should face  
Disaster and disgrace!  
Now is the vital, now the crucial hour;  
Though if some needs must sup  
The stirrup-cup.  
With all our virile power,  
Speed up! Speed up!

Speed up, for Freedom's sake!  
From shore to shore, awake,  
Land that has had base insults thrust upon her!  
To thy just cause we sup  
A brimming cup.  
Home that we love and honor!  
Speed up! Speed up!

### JELLIES AND JELLY STOCKS

By W. V. Cruess

**F**OR the production of jelly three things are necessary; namely, fruit pectin, fruit acid, and sugar. The pectin and acid are supplied by the fruit and are extracted from the fruit by crushing and pressing, or by cooking the fruit and pressing. The sugar must be added. The sugar has two functions: It makes the setting of the jelly possible and it acts as a preservative for the jelly. The general principles of jelly making are practically the same for all fruits. The main steps in the process are the extraction of the pectin by cooking, and pressing, and the clearing of the juice by filtration or settling, and the boiling of the juice that the jelly may be formed with the sugar. The directions given below for loganberry jelly may be applied with a few modifications to other jellies.

#### Loganberry Jelly

Crush the berries and heat to boiling in an agateware or aluminum pot without the addition of water. Boil about two or three minutes. Press out the juice through a cheesecloth or jelly bag. Add a very small amount of water to the pressed pulp and heat to boiling. Boil for about ten minutes and press out the water solution. This may be added to the first pressing. Test the jelling qualities of the juice by mixing one glass of sugar and one glass of the juice in a small pot. Boil until the jelly will sheet from a spoon or until it boils at 220 degrees Fahrenheit, or until it will test 32 degrees Baume or 59 per cent Balling in the heated juice. A candy thermometer or a good chemical thermometer can be used to test the boiling point. If this is not used, a Baume hydrometer, obtainable through any drug store for about 50 cents, may be employed. In using the Baume hydrometer the hot juice is poured into a tall glass cylinder and the hydrometer is inserted. The reading is made at the surface of the liquid. However, the use of an hydrometer or thermometer is not necessary to make jelly. It is only necessary to boil it down until it will sheet from the spoon. If this preliminary test shows that the loganberry juice has enough pectin to make a satisfactory jelly the whole lot may be made up into jelly by adding an equal quantity of sugar and boiling down until the jelly will freely sheet from a spoon. It may then be poured boiling hot into glasses and sealed with melted paraf-

fine. To make clear jelly the fruit juice, immediately after it has been pressed from the fruit, must be filtered several times through a thick cloth or through a felt jelly bag. The filtering must be done before the sugar is added because the sugar makes a syrup so thick that it can not be filtered.

#### Other Fruit Jellies

Apples must be covered with water and boiled before pressing. A mixture of one lemon and two oranges, sliced and covered with water and boiled for one hour will make very satisfactory jelly. The oranges furnish the pectin and the lemons furnish the acid in this case. Blackberries, currants, and other berries do not require the addition of any water. The juice from all of these fruits may be made into jelly by the addition of an equal quantity of sugar by volume and by boiling down to the jelling point. A number of other fruits notably, apricots, peaches, pears, strawberries, raspberries, do not contain enough pectin to give jelly. Therefore, the juice from these fruits must be combined with the juice from fruits rich in pectin. Such combinations as loganberry and strawberry, loganberry and raspberry, or apple and apricot juice may be used satisfactorily if enough of the loganberry or apple juice is added to furnish the needed pectin.

#### Jelly Stocks

The juice from fruits prepared by boiling and pressing as described above may be sterilized and kept indefinitely in bottles or in jars and used as needed for jelly making. The juices are sterilized immediately after pressing from the fruit and before any sugar is added. This makes it possible to distribute the cost of the sugar over the entire year and also makes it possible to blend any two fruit juices desired. The method is as follows:

Heat the fruit to boiling, with or without water, as the case may be, and boil for the required length of time. Press out the juice as for jelly making. Strain it through a cloth several times to clear it. Place it in a pot and heat to boiling. Pour it boiling hot into scalded jars or cans and seal at once. It will keep until needed in these containers.

An alternate method is to place the juice after filtering into clean bottles. The bottles are filled to within about an inch and a half of the top. These are then corked with corks sterilized by boiling in water for ten minutes. The corks are tied down with a string. The bottles are placed in a horizontal position in a large pot or washboiler in which has been placed a false bottom to protect the bottles from the direct heat of the fire. A wire screen, wooden grating, or a

towel may be used as a false bottom. The bottles are covered with water and the water is heated to almost boiling point and kept at this point for about ten or 15 minutes. The bottles are then removed and the corks are dipped in melted paraffine or melted sealing wax to seal them.

The bottles or cans or jars may be stored in a convenient place and made up into jelly as occasion demands. To make a jelly from this jelly stock, shake the container thoroughly to mix it, pour out the contents, and add an equal quantity of sugar. Boil the mixture down until it jellies. It may then be poured into glasses and other containers in the same way as with ordinary jelly.

### THE CROOKEDEST RIVER

**S**OUTH AMERICA'S "River of Doubt" has a rival in the Humboldt River in Nevada which comes forward with an entirely new claim to distinction. The Humboldt flows southwesterly through the central portion of Nevada. This river is declared to be, in point of size and length, the crookedest river in the world. It is so crooked that sportsmen bring strange tales of fish and game that become confused in trying to follow the river's course and act as though intoxicated.

At one place between two points two and a half miles apart, the river's length is eight miles and by actual count its course is alternately north 25 times, east 18 times, south 30 times and west 41 times; also it may be stated that at 33 different points it is within 150 feet or less of itself, the current flowing in opposite directions by these points. This "runaway river" crosses the Southern Pacific tracks 23 times necessitating as many bridges costing in all \$654,000.

By way of showing how completely "locoed" it is, the Humboldt ends its course by running into the middle of the desert and corkscrewing its way out of sight in a huge sink.

On account of its devious way this stream is a sportsman's paradise. Ducks and geese, after following its treacherous course a short distance, become deluded and forget their direction, returning five and six times to the point at which they were disturbed. Fish experience the same difficulty and become so perplexed that they refuse to swim. The Indians have discovered this and simply net the fish while they are dazed.

Fred A. Riecker, valuation engineer of the Southern Pacific, and not Baron Munchausen, is responsible for this account of the peculiarities of Nevada's crooked river.

### NOT SO WRONG

A Russian applicant for naturalization papers was asked, "What is the Constitution of the United States?" "Rugged and healthy," he answered. Of course, there is a laugh, but still he said something. — Washington Herald.

## MORE BETTER LIGHT

Install a PRIVATE GENERATING PLANT and have ELECTRICITY FOR LIGHT AND POWER. The Uni-Lectric system generates the standard 110-volt direct current, which will operate from 1 to 50 lights. It will run your sewing machine, electric iron, vacuum cleaner, churn, washing machine, etc.

### NO BATTERIES---NO SWITCHBOARD

High speed gasoline motor, generator and automatic governor, all complete. Uses standard lamps and fixtures. Can be used for one or more houses.

WRITE FOR ILLUSTRATED CATALOGUE TO

104-106 Clay St.

San Francisco, Cal.

### OUR SUB-HUMAN ARMY

By F. W. Fitzsimons in "Our Dumb Animals"

OUR sub-human army runs into millions of units. Without this army all our offensive and defensive operations at the various fronts would utterly collapse. In Egypt and Mesopotamia the camel is part and parcel of the fighting forces. He blusters, rumbles, bites and kicks, and is at times otherwise objectionable, but he does his bit all right. Death alone breaks him. He marches along, keeping pace with the infantry, laden with great loads of munitions. At other times he carries two fully armed soldiers. Notwithstanding his surly ways, the men love him. They admire his grit, the indomitable spirit which carries him on and on until he drops to rise no more.

Then those noble sub-human fighting units, the horses. True altruism is exemplified in the horse. He asks no payment. For a bare living he performs herculean work at the front. Without him our armies and those of our allies would melt away like mist before the rising sun. He carries his rider straight at the enemy; drags the guns into position; brings munitions up to the fighting lines; transports the men from point to point in situations impossible for motor traffic. At Marne and Mons he upheld the honor of the French and British. Side by side with his heroic masters, he fights on, torn with shot and shell; gassed; squirted with liquid fire; bombed from the skies; blown up by subterranean mines; drowned at sea on his way to the front.

Can we do enough for him? No! However strenuous our efforts, we cannot compensate him for his services on our behalf. We can at least help him. We can save the lives of large numbers of his kind, and ameliorate his sufferings of others.

In our army of sub-human helpers we must not forget the so-called stubborn mule which plods along, content to subsist and do his bit at any time on the shortest of commons. His ally and relative, the ass, also renders sterling service. Where horse and mule perish of hunger, exhaustion and cold, the tough and hardy donkey toils on through the mountain passes and ravines; and anywhere his master is able to go he follows, laden with the necessities of life and munitions.

Last but not least is the dog. He does his turn in the trenches doing sentry go. While the men slumber, and his master who is on guard with senses dulled and body numbed with the cold, is feebly peering into the dense mist, or endeavoring to detect signs of a night attack, his faithful ally, with every sense tuned to the highest pitch of intensity, watches by his side ready to give the alarm the instant there is a movement in the enemy trenches. This is but a small part of his work. He goes out in couples and succors the wounded. He scours the battlefield, and finding a helpless wounded man, sympathetically licks his face or hand, as much as to say, "It's all right, old fellow; I will soon bring help."

Off he goes and brings up an ambulance party who do the needful. Bounding out from a trench he races in the open across the fields and hillsides, running the gauntlet of the enemy fire, in order to carry a despatch which may mean the difference between life and death to a battalion of men. In pairs he swiftly transports machine guns, ammunition, wa-

ter, and food to the men at the various points, and aids them in similar ways to move from place to place.

Can we do enough for him and his allies, the horses, mules, donkeys and camels? Assuredly no. We can do a little, and that is all, and we are going to do it today, everyone of us.

\* \* \*

In the same number of "Our Dumb Animals" we note: "A hospital has been opened in Paris to treat the wounded dogs which have played so large a part on the French side in this present war. The official Red Cross dogs, the messenger dogs, and even those kept by the troops as mascots are being cared for here when sick or injured."

The "Red Star" has been organized here to do the same kind of work for our "sub-human army" that the Red Cross is doing for the human.

### CANNED TOMATO SAUCE OR PUREE

Cut the tomatoes into fairly small pieces and add a large sized onion chopped and one cup chopped sweet red pepper to one gallon tomatoes. Cook until tender. Put through a sieve and add a mixture of one-third salt and two-thirds sugar in proportion of one teaspoon to each quart of mixture. Cook until the consistency of ketchup, stirring constantly. Pack hot into sterilized jars or bottles. Adjust rubber and cap, place containers on a false bottom in a vessel of hot water sufficiently deep to reach almost to their tops and allow to remain at a boiling temperature 25 minutes. Remove jars from the water bath and tighten the lids immediately.

### BAKING THE POTATO

By Eugene H. Grubb

Place the potato in a moderate oven for 20 minutes, then increase heat to finish. If heat of oven is too fierce the cortical layer becomes a hard shell and when opened sticks to the skin, thus the protein and mineral constituents are lost to the consumer.

Upon taking from the oven, take the potato in the napkin and knead gently to soften and break the pulp. Then break the skin slightly on one side. This allows the moisture to escape and when the potato is opened the pulp will be dry and mealy and have a glistening, crystalline appearance. The cortical layer will be softened and come from the skin with the pulp and none of the food value is lost.

### NAGGING WIVES

"I have seen more men fail in business through the attitude taken by their wives in their younger days than from all the vices put together," wrote Charles M. Schwab, chairman of the Bethlehem Steel Corporation, in the American Magazine. "A nagging wife, or one who is not in sympathy with a man's work, who expects impossible things of him, and is incapable of taking a general intelligent interest in his work, is one of the worst handicaps he could have."

### DID HE HOLD BY HIS TEETH—OR HIS TOES?

He was fortunate enough to catch hold of the overturned boat and hung on grimly, waving his arms and shouting for help.—Waukegan (Ill.) Sun.

### BEST KID STORY

Willie—"How fast the horse is running!"

Teacher—"You forgot the 'g.'"

Willie—"Gee! How fast the horse is running!"

### THE STIRRUP-CUP

By Louis Untermeyer in Youth's Companion

Your eyes—and a thousand stars  
Leap from the night to aid me;  
I scale the impossible bars,  
I laugh at a world that dismayed me.

Your voice—and the thundering skies  
Tremble and cease to appal me—  
Coward no longer, I rise  
Spurred for what battles may call me.

Your arms—and my purpose grows strong;  
Your lips—and high passions complete me . . .

For your love, it is armor and Song—  
'And where is the thing to defeat me!

### HOW TO SELECT FOODS

Farmers Bulletin No. 817, by Caroline L. Hunt and Helen W. Atwater, published by the United States department of agriculture, Washington, D. C., is the second of a series on how to select foods. This one bulletin touches upon cereals. Every housewife should find it of interest. Write United States Department of Agriculture, Washington, D. C.

**COOLNESS**

There's nothing so cool as an oil stove for summer cooking. All the heat is concentrated on the cooking and not radiated about the kitchen.

Cooks everything any wood or coal range will cook, and cooks it better, because of the steady, evenly-distributed heat.

Use it all the year 'round—more convenient than a wood or coal stove, and more economical.

The long blue chimneys prevent all smoke and smell.

In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

### LET'S EAT RAISINS

Written for California Cultivator  
By Mrs. A. Stainton

HAVE never yet been able to understand why so many women look upon housekeeping as a bore and find the ordering and cooking three meals a day for three hundred and sixty-five days of the year difficult. In reality there is nothing finer in life than housekeeping—home making is a better word, for upon that rests the whole fabric of civilization. The work is interesting too, for the food must be wholesome and nourishing, varied to tempt both the eye and palate, and yet it must conform to the amount of the income.

Nothing wearies the appetite more than a continued round of meats and best known vegetables in their various forms, and fruits, nuts and cereals should be used freely. The use of fruit is not always understood as well as it deserves to be. Instead of considering fruit a food accessory, their extreme palatability makes them a necessity to every meal. Dried fruits are really concentrated foods and are the cheapest of all food products. Take for instance raisins. Raisins are grapes that the sun has dried, "cured" is the technical term, and in the process of drying much of the water which enters into the composition of the grape is evaporated leaving the real food, the protein, the sugar, the fat and mineral matter behind. In the drying, the protein is so transformed by the action of the sun's rays that it is rendered very easy of digestion. Raisins require no cooking to make them either palatable or digestible but for variety's sake they are served in many cooked forms. When we get raisins for our table, we are getting nourishment at a very low cost for raisins are cheap and when their food value is taken into consideration, they are among the cheapest of foods, and in selecting foods we cannot afford to overlook the cost. It is just as important to live economically as to live well, and the continued use of raisins will do much to lower our market bills.

**Raisin Corn Bread.** Mix 1 cup sifted flour, ½ cup yellow corn meal, 2 teaspoons baking powder, ½ teaspoon salt, 1 tablespoon sugar, stir in 1 cup milk, 1 well beaten egg and 2 tablespoons melted butter and a cup raisins. Bake in well greased pan in quick oven about 20 minutes.

**Gingerbread.** Four teacups flour, 1 of butter, 1 of sugar, 1 of syrup, 1 of buttermilk, 1 dessert spoon ginger, 1 dessert spoon cinnamon, 1 teaspoon caraway seeds, 1 teaspoon baking powder, ¼ pound Sultana raisins, 2 ounces lemon peel (candied), 1 egg, pinch of salt. Mix all dry ingredients, add beaten egg, melted butter and syrup warmed and buttermilk. Mix thoroughly and pour into buttered tin. Bake in rather slow oven. When cold cover with chocolate frosting.

**Raisin Rolls.** Three cups flour, 3 teaspoons baking powder, ½ teaspoon salt, 2 tablespoons sugar. Sift thoroughly and add ½ cup butter creamed and milk to make a soft dough. Roll out on a floured board, brush over with melted butter, sprinkle with chopped raisins, sugar and powdered cinnamon. Roll up closely, cut across the roll in inch thick slices, lay them on a buttered tin and bake in a quick oven. Cover with plain icing.

**Raisin Pie.** Three-quarters cup each of chopped apples and raisins, ¼ cup sugar, ¼ teaspoon cinnamon, ½ teaspoon salt, ¼ teaspoon cloves and nutmeg, 2 tablespoons cornstarch, 2 tablespoons sifted crackers, ½ teaspoon soda, 1 cup sour cream. Mix chopped apples and raisins and let them stand 30 minutes. Add the sugar, spices, corn starch and cracker crumbs, seasoning. Dissolve the soda in the cream (sour milk may be used). Beat well and add dry ingredients to fruit mixture; bake between crusts of rich pastry.

**Raisin Rice Pudding.** One and one-

half cups cooked rice, add two-thirds cup sugar, ¼ package of seeded raisins, 3 well beaten eggs, 1 quart milk, 1 teaspoon vanilla. Pour into buttered pan, grate nutmeg over top and bake until brown.

**Raisin Pudding.** In a well buttered pie dish lay some sandwiches made from white or brown bread sliced thin, spread with butter, sugar and raisins. Make two layers of sandwiches and pour over a custard made of one quart of milk, three well beaten eggs, half cup sugar, vanilla and nutmeg to flavor. Bake until custard is set.

**Raisin Cookies.** Chop one package of seeded raisins, add two cups finely chopped nut meats, two cups sugar, two tablespoons corn starch and ¼ stiffly whipped whites of four eggs. Mix thoroughly, drop in spoonfuls on buttered paper and bake delicately brown.

**A Dainty Tid-bit.** Put seeded raisins through the food chopper, weigh and add one-third the weight in sugar using a little honey if necessary. Work sugar into the paste. Mold with the fingers into tiny balls. Dip in melted chocolate.

**Raisin Sandwiches.** Equal quantities chopped raisins, figs, dates and walnuts mixed with cream cheese spread between bread and butter. On one slice place a leaf of lettuce; cover the other slice with mixture.

**Raisin Fudge.** Two cups sugar, cup milk, butter size of an egg, cup chocolate. Cook, stirring continually until bubbles break slowly. Have ready ½ pound walnuts chopped fine and 1 pound chopped raisins. Add these, stir until stiff and pour into buttered pans.

### A GLIMPSE AT THE WORLD'S MARKETS

A suit in the San Francisco court shows reason for the May slump in onion prices. A large dealer bought from an importer 75 tons Australian grown onions. The purchasers refused to accept the onions and they were thrown on the market at about a third their cost to save something. The suit is now calling for payment of the balance.

The state railroad commission has authorized the Farmers' Transportation Company, operating boats on the Sacramento River, to increase its rates 5 cents a ton. This on grain, beans and potatoes.

Eggs are advancing sharply on the San Francisco market. Outside shipments have practically been discontinued. The advance in six days was six cents.

The last large shipment of butter and eggs to Alaska before the closing down of the season was on August 4. Heavy shipments will not be resumed until opening of navigation in the spring.

San Francisco reports great shortage of all dairy supplies caused by the extreme heat.

The training camp at Palo Alto will require 1200 pounds of butter daily.

Imperial cantaloupes having ceased to come to market, Los Angeles is now depending upon supplies from nearby farms.

Watermelons are still holding up at a good price, Los Angeles markets paying around two cents.

Some barley growers are demanding \$2.40, with jobbers endeavoring to force prices to a lower level.

San Francisco reports potato and onion market exceptionally strong, with promise of higher levels being reached. This is being assured, in part at least, by heavy Eastern demand.

Kansas and other corn states are reporting welcome rains which have caused a slight lowering in corn quotations.

Prices of oats have been slightly shaded because of heavy rains and satisfactory crop conditions.

Chicago prices of good hard winter wheat, spot delivery, are around \$2.40 per bushel.

The minimum of \$2.00 per bushel for wheat, which has been fixed upon a conference committee of congress is not to apply in any way to the 1917 crop, but is intended as a guarantee for the 1918 crop and will be binding until May 1, 1919.

The hot wave which has been general over the East has caused a cleaning up of all lemons on track or stored, and has greatly lessened the packing house supplies in California. Even with heavy imports prices must remain good on the few locals still in packing houses. One car sold in New York close up to \$9.00 average and many sales netted around \$5.00 and \$6.00 per box.

Potatoes are higher. Los Angeles is paying around 3.35 and 3.50. Reports from Stockton state that labor shortage has had some effect upon prices, by preventing the marketing of the river crop with sufficient rapidity to fill all demands. Values there have moved up substantially the last few days. However, this has been offset to some extent by an improvement in the transportation situation.

Idaho apples have been damaged by hot spell. Hood River will have good crop, Northern California crop somewhat damaged by heat.

Cotton is stronger. Sales for August delivery show sharp advance. At New York it is selling at \$27.70. This is the highest quotation made in the future market in 45 years.

HAY

Under date of August 4, Scott, Wagner  
& Miller say:  
Receipts past week, 2085 tons, last  
week 1785 tons.

A good part of this arrived by water,  
cars being scarce and hard to obtain.  
Considerable activity has been shown  
throughout the country districts during  
the week and many sections report trade  
quite brisk with considerable hay chang-  
ing hands. Arrivals have consisted prin-  
cipally of No. 1 to choice grades, stock  
hay being scarce, with a good demand.  
Trade throughout the city is dull, con-  
sumers still holding back from buying  
winter supplies, awaiting larger re-  
ceipts. Export trade shows no improve-  
ment. Alfalfa arrivals are light with  
fair demand.

Some new straw arrived during the  
week but as it was pressed in heavy  
bales it was sold by the ton and not by  
the bale as usual.

We quote today wholesale prices in  
carload lots as appear from dealers'  
transfers upon the market. For prices  
to consumers charges of cartage, com-  
mission and handling expenses must be  
added.

Wheat, Fy. lt. bales .....20.00@21.00

Citrus Fruit Market

LOS ANGELES, August 8, 1917.  
The last week has been one of spec-  
tacular ups and downs, especially with  
lemons. Oranges have been affected  
somewhat by the weather but the mar-  
ket as a general thing has been most  
satisfactory. Prices have ranged, how-  
ever, according to quality from well  
down towards one dollar to above five  
dollars.

The hot wave has stimulated the lem-  
on market and prices have gone higher  
than for years. Some sales have been  
made well up toward \$14 per box.

**Shipments**  
Shipments of oranges from Southern  
California since November 1, 1916, 35,254  
cars, lemons 6969, total 42,223; to same  
date last year oranges 27,791, lemons  
6035, total 33,826. From Central Califor-  
nia to date this season oranges 5042,  
lemons 164, total 5206; to same date last  
year oranges 5398, lemons 146, total 5544.  
From Northern California to date this  
season, oranges 845 cars; to same date  
last season, oranges 610, lemons 1.

FROM THE AUCTION

August 1  
New York: 20 oranges, 2 lemons, 1  
grapefruit, lemons much higher. Val.  
\$1.45@3.95; lemons, \$8.35@10.50; grape-  
fruit, \$0.75@2.45.

St. Louis: 6 cars, oranges lower, lem-  
ons higher, Val. \$2.50@3.30; lemons,  
\$3.15@4.85.  
Pittsburgh: 11 cars; Val. \$1.65@3.55;  
lemons, \$7.60@10.70.

Cleveland: 6 cars; Val. \$1.85@3.75;  
lemons, \$9.55.

August 2  
New York: Market active on Valen-  
cias, excited and much higher on lem-  
ons. Val., \$1.70@4.70; lemons, \$3.20@  
13.60.

Boston: 13 cars; higher; Val., \$1.90@  
3.10; lemons, \$9.40@11.10.

August 3  
New York: 15 Val. 1 lemon; market  
higher; Val. \$1.90@4.80.

Boston: 15 cars; lemons slightly lower;  
Val., \$1.55@3.45; lemons, \$5.90@9.36.

St. Louis: 6 cars. Easier on oranges;  
Val., \$2.06@3.30; lemons, \$4.45@8.35.  
Cincinnati: 2 cars; Val., \$2.45; lemons,  
\$7.80.

August 6  
New York: 35 oranges, 1 grapefruit, 2  
lemons. Oranges higher, lemons lower.  
Val., \$1.80@5.05; lemons, \$2.35@7.40;  
grapefruit, \$0.80@2.40.

August 7  
New York: 32 oranges, 1 lemon; or-  
anges lower; Val., \$2.15@4.70; lemons,  
\$2.80@5.30; grapefruit, \$2.30@2.95;  
sweets, \$2.15@3.30.

Philadelphia: 7 cars; Val., \$2.75@4.40.  
Boston: 7 oranges, 1 lemons; Val.  
\$2.70@4.05; lemons, \$5.70@8.55.

## A Good Tractor to Own

A **MOGUL 10-20** kerosene tractor will go a long way toward solving your labor and expense problems. Men who use this tractor properly say it does as much plowing, disking and harrowing in rush seasons as three men and nine horses. In the heat of the harvest fields, and for summer plowing, three four-horse teams can hardly keep up with it, because it works steadily all day long.

Besides, it is so simple that almost anyone can learn to handle it efficiently. A few days' training in the handling of a kerosene engine is usually all that is needed.

These two features make the **Mogul 10-20** highly desirable. Add to them the fact that it operates on a fuel that you can always buy, and at a reasonable price, and you have a power plant that is hard to beat for all-the-year-round work in the field or at the belt.

You know the standing and reputation of Mogul tractors. When you buy a tractor, don't overlook this good, simple, reliable, economical three-plow **Mogul 10-20**. Booklets and folders give complete information. When you write for them, address

## Answering the Nation's Call

IN this "supreme test" of the nation, private interests must be subordinated to the Government's need. This is as true of the telephone as of all other instrumentalities of service.

The draft for war service which has been made upon the Bell System is summarized in a recent Government report.

Government messages are given precedence over commercial messages by means of 12,000 specially drilled long distance operators all over the country.

The long distance telephone facilities out of Washington have been more than doubled.

Special connections have been established between all military headquarters, army posts, naval

stations and mobilization camps throughout the United States.

More than 10,000 miles of special systems of communication have been installed for the exclusive use of Government departments.

Active assistance has been given the Government by the Bell System in providing telephone communications at approximately one hundred lighthouses and two hundred coast guard stations.

Communication has been provided for the National Guard at railroad points, bridges and water supply systems.

A comprehensive system of war communication will be ready at the call of the Chief Signal Officer, and extensive plans for co-operation with the Navy have been put in effect with brilliant success.

As the war continues, the demands of the Government will increase. And the public can help us to meet the extraordinary conditions by putting restraint on all unnecessary and extravagant use of the telephone.

## Can You Spare a Few Hours Each Week to Handle a Profitable Local Agency?

We need a representative in each county to put the Fruit Growers, Live Stock Men, Farmers, Dairymen and Poultrymen in touch with the money-making ideas, results of experiments and real farm and live stock information of value to be obtained from California Cultivator.

Only a small part of your time is needed each week to make money under our plan. We want to secure the services of men and women who can present a meritorious offer. You don't have to have previous experience. If you can do as well as others who had no more training than yourself, you can make splendid wages just for your spare time.

Our proposition interests every producer. There is an opportunity here for you—if this fits your case. If it does write to

## Of Interest to Citrus Fruit Growers

### IS FUMIGATION A PROFITABLE INVESTMENT?

Several years ago in a meeting of citrus fruit growers at Redlands Mr. James Mills, then the general manager of the Arlington Heights Fruit Company of Riverside, California, in a talk on methods of scale control, among other things said:

"I bought ten big spraying outfits and went to work, and for years contended that I was right, and contended that I was saving money, because I was treating my trees for one-half or one-third of what it cost to fumigate in those days, if not less than that, and I felt that all the rest was saved. I felt that it was an economic question and that if I could do it for less, that I was saving money. \* \* \* \* \*

"After my spraying operations had been done, I found that I **COULD NOT GET OVER 80 PER CENT** of the scale; and the **OTHER 20 per cent** left me almost as bad as that sinner in the Scriptures; **A GREAT DEAL WORSE AFTERWARDS THAN BEFORE.** So I went to my manager and said: 'I want five thousand dollars.' 'For what?' 'To buy an outfit for fumigating the trees.' \* \* \* I got the money, I got the tents, and I got to work. At the end of two years I had expended forty thousand dollars in cleaning up, and I **CLEANED** and I **USED THE STUFF** and I **GOT THE SCALE**, and I **REJOICED**, and may I say it, **EXCEEDING GLAD.** I was able to say, and **SAY TRUTHFULLY** to my general committee, to my directors, it has cost forty thousand dollars, but **IT HAS NOT COST YOU A CENT.** Apparently you have expended the money but I know that I have **PRODUCED TWO DOLLARS IN FRUIT EXTRA** for every dollar of money that I have expended in these operations; I know that; **YOU HAVE PROOF OF THAT IN YOUR DIVIDEND.** There was no question about it; there could be no question; it was a demonstration that could not escape anybody; we were satisfied with our expenditure because **WE HAD THE FRUIT THAT WE GREW BEFORE**, and **SO MUCH MORE THAT WE HAD OUR MONEY AND ANOTHER DOLLAR ALONG SIDE OF IT; THAT WAS A GOOD INVESTMENT.** Any business man will put a dollar in if he gets it back accompanied by another dollar; only some fruit men are not business men.

"I have stated to you that I spent forty thousand dollars, and was able to say that it did not cost them a cent. Do you see the point? That if I had not spent the forty thousand dollars I would not have gained half the crop, and that is the fact, I gained so **MUCH MORE FRUIT**, directly as the **RESULT** of the **CLEAN-UP** of the trees that I produced that **MUCH MORE MONEY—THE FORTY THOUSAND DOLLARS** and **ANOTHER FORTY THOUSAND DOLLARS ON TOP** of it, **AND STILL SOME MORE.** \* \* \* \* \*

**NOW, DID IT PAY? YES.**

"**BETWEEN FUMIGATION AND SPRAYING THERE CAN BE NO QUESTION.** \* \* \* I have a block of 400 acres that I have not fumigated in four years. It was dirty; I sprayed, and I sprayed, and then I sprayed year after year, and while I denied then that it hurt the trees I know now that it did; I know that the tree was weakened; I can show you trees that have not recovered from it! Trees that I have had to apply more fertilizer on, that I have had to agonize over and to little purpose; trees that had to be cut away to get the new growth, the new live wood with the sap coursing through its ramifications, and now setting and holding the crop of fruit."

Superintendent Little now says:

"It is our experience that the Hydrocyanic acid gas is most satisfactory to use to eradicate or hold in check the various scale that affect the citrus trees.

"We have tried various sprays and combinations of sprays but the results were unsatisfactory and until something else is shown to be better than Hydrocyanic acid gas we will continue to use the same.

"The citrus fruit grower cannot afford to let his trees become infested with scale if he is dependent upon the returns from his fruit for a living."

G. HAROLD POWELL in Bulletin No. 123 of the U. S. Department of Agriculture, among other things says:

"The necessity for **WASHING** the orange **SHOULD BE AVOIDED** by a proper fumigation of the groves with cyanide" (this of course means fumigation with hydrocyanic acid generated from cyanide). "**FUMIGATION**, on the other hand, is one of the operations that **PROMOTES GOOD ORCHARD MANAGEMENT**; it **MAINTAINS STRONG, HEALTHY TREES** and **FRUIT**; and it **REDUCES** the **COST** of **PREPARING** the **ORANGES** for the market in a manner that **INCREASES THE KEEPING QUALITY OF THE FRUIT.**"

The results of **SURVEYS** and **EXHAUSTIVE INSPECTIONS** of citrus groves covering several thousand acres made this year in the counties of San Bernardino, Riverside, Orange and Los Angeles, show that **FUMIGATION EFFICIENCY** stands at **99.5 PER CENT.** The average efficiency for **SPRAYING OPERATIONS** SHOWS **LESS THAN 45 PER CENT**, WITH **SERIOUS DAMAGE TO TREES AND FRUIT.**

**CYANEGG WILL**, this year, be available for the full needs of the citrus fruit growers. There is no need for growers to resort to the more expensive and less efficient spraying. **EVERYONE OWNING A GROVE SHOULD FUMIGATE.**

## Where Fruit Trees are Propagated and Nursed

A Couple of Large Nurseries Where Trees are Brought to Life, Nursed and Trained in the Way They Should Grow. Written by A. Layman

**E**VERYBODY — everybody as is an optimist—loves to take home a package of seeds or a potted plant or a tree and then spend hours in imagining how it will grow and produce

rant and beautiful, its fruits are luscious, its owner is prosperous. There are millions of such trees in California. They form the most beautiful feature of our landscape. They bring the lover of things beautiful to Cali-

conditions, all make for growing a fine stock. Then come the difficulty of securing experienced and honest help; pests without number; horticultural laws, which are an effort to protect the industry on which he depends for his living, yet sometimes unjust in some of their workings; finally the transportation question which, in combination with horticultural laws and county ordinances, is a most serious one. The tree handler is confronted by the law which says

an output of citrus trees as has the citrus nursery at San Dimas. California has had olive nurseries where literally millions of twigs were turned into orchard trees and nurseries where rose cuttings are propagated, which are amongst the world's greatest. In an issue of the Cultivator a few months ago reference was made to Central California nurseries where thousands of acres are given up to the culture of grape vines or figs or peach trees.

John S. Armstrong

The entrance to Mr. Armstrong's office and sales yard is especially attractive and an indication of thrift and careful work.

owers or fruits. There is a fascination in roaming about a seed house or nursery. There is so much of promise everything you see, especially the catalogue. The promises do not always come true. Why? Well, that's a awful long question or rather a tree letter question which calls for a long answer. Quickly and easily we can say "It's the nurseryman's fault." Here are not many of him to come

fornia to spend millions. They require tens of thousands of cars to take their fruits overland and bring back the wealth they create.

All because a tiny seed sprouted and was nursed into a lusty tree planted by rivers of water, its leaf not allowed to wither because it fell into the hands of one whose "delight is in the law of the Lord and in his law doth he meditate day and night."

Sizing up Heat Effects

R. M. Teague, without coat at right discussing with F. H. Thomas effect of hot weather on navels. Mr. Teague not only grows citrus trees but fruits as well.

he cannot deliver trees until a county inspector releases them. The county inspector may be many miles away on other inspection work. Perhaps the weather conditions are such as to decrease the vigor of the young trees to be planted. Then when the season is over thousands and possibly tens of thousands of "holdovers" must be burned or otherwise disposed of.

California is the first state in the Union in the production of plants and trees. The business now totals an-

R. M. Teague has been in the citrus nursery business since the late eighties. He has supplied world's fairs with bearing orchards; he has shipped trees into Southern Africa and even into Central India. They have been months on the road, and the most severe criticism received was "The trees were all alive, but a little slow to start." These were citrus trees which are not supposed to be dormant and are known to be most difficult to transplant. The nurseries are located in eastern Los

Under the Lath at Armstrong's

A side entrance to office opens from the lath house. Hanging baskets and almost every shrub and tree are exhibited in this lath house.

ack at us with denial and there are so many of us who have failed with some plants or trees, that in preponderance "evidence" we would be able to make proof.

But in common fairness isn't a division of responsibility wise? We all agree there is failure at times. But first, as we started with the suggestion that we are largely optimists, what happens when a tree, a perfectly proper tree, is planted in a perfectly proper way, then cared for? It grows, it thrives, its leaves are glossy and dark, its flowers are frag-

But that other who fails to meditate, and hustle, but burneth much gas, there's the rub.

There is where the nurseryman gets his. For Mr. Orchardist comes back with "Say!" Then the nurseryman sits down and explains how thrifty the trees were, their fine root system and other points. It ends in more trees being planted and usually better results.

So the nurseryman has his troubles. His own training and experience, usually abundance of capital, ability to choose right soil and water

nually in excess of \$3,000,000, and as usual has some of the greatest plant growing concerns in the world engaged in it.

No nursery has ever had such

Angeles County at San Dimas.

The seed used for citrus stock is now almost exclusively secured from the sour orange grown in northern

Continued on Page 150

Capacity for 20 Carloads of Citrus Trees

The R. M. Teague Nurseries take up trees from nursery and harden or season in lath house before shipping. Most of the trees are shipped with "bare roots" packed in wet shavings.

## Treatment of Navel Orchard This Year

THE San Antonio Water Company of Ontario, in its effort to gather information of value to its patrons on the subject of intercrops, has asked Dr. H. J. Webber of the citrus experiment station as to the best handling of citrus orchards in view of the present situation. Dr. Webber answers:

Navel groves are left in large measure without a crop of fruit. In general they have not been otherwise injured and are now showing great vigor where they were in good condition before the hot weather. They have no crop to mature and it is evident that the fertilizer requirements for this season will not be so great as where a large crop is maturing. In probably all navel groves it will be safe to cut out all future fertilization this year. Nitrogen is the element most needed in our soils and is at the same time the element most readily lost. To keep up the fertility requirements and prevent loss, it may be found desirable in some cases where a grower has sufficient water to plant cow peas or black eye beans immediately as a summer cover crop to be turned under about the last week of September in time to allow the planting of a winter cover crop. Probably in such a case as this better results would be obtained by disking under the crop than by plowing. Such a summer cover crop to be worth while, should be planted at least by the first of August and seeded rather more thickly than when growing the crop for seed. This summer cover crop should not in my judgment be allowed to take the place of the winter cover crop which is more important.

The winter cover crop of some legume, such as Melilotus, Windsor beans, or vetch, should not be neglected this year, as by this means the grower secures the cheapest possible fertilization with nitrogen and organic matter, the two elements of fertilization most needed by California soils. If the grower finds it possible to grow and add to the soil two fairly good cover crops between now and early next spring, it is possible that a grove in good condition now could be carried through the season of 1918 without further fertilization, and at the same time carry a good crop of fruit next summer.

It is certain that our ordinary fertilization will from necessity be greatly interrupted next year, as it is becoming almost impossible even now to secure the ordinary materials. Potash is very expensive and cannot be obtained in quantity. In view of the fact that experiments have shown that this element has very little effect in citrus fertilization in California, its omission from our fertilization for several years will certainly cause no loss either in fruit or condition of trees.

Phosphoric acid fertilization, while more noticeable in effect than potash, is nevertheless not very quickly visible in effect on the tree or fruit, and as this element is usually present in considerable abundance in California soils, it is probable that its entire omission from fertilization for two or three years will cause no visible effects. In the present emergency, therefore, it is believed that citrus growers may safely omit potash and phosphoric acid from their fertilization for two or three years, providing their land and groves are now in good condition.

During the war period fertilizers will be expensive and difficult to secure, and growers will be compelled in large measure themselves to produce such as are required. It is fortunate that we have so many leguminous crops that can be grown in the groves to supply the necessary nitrogen and organic matter. Under present conditions, therefore, it becomes more than ever important to grow good cover crops to turn under as green manures. Some growers still continue to grow cereals, such as barley and rye, for the purpose, apparently failing to understand that cereal crops do not possess the faculty of gathering nitrogen from the air as do the legumes.

It is also important in this crisis to strongly advocate the careful conservation and use of all manure produced, and of all spoiled alfalfa hay and other organic materials.

### Pruning

It may be suggested that where navel groves need pruning or thinning out, the present conditions offer excellent opportunity to do this without injury to the crop. Such pruning, however, should be done as early as possible so that the new growth stimulated by the pruning will become fully mature before there is danger of severe frost. In the case of run-down groves, that it is desired to bring up, a severe pruning at this time can be made without loss of fruit, and would probably put the trees in good condition for a crop next year, if at the same time the other conditions of culture are improved.

### The Use of Intercrops for Profit

Many questions are being asked regarding the intercropping of groves

with crops grown for profit and for the purpose of increasing our supply of food stuffs. There are probably nearly as many opinions regarding this matter as there are growers, and very little exact experience from which to formulate policies.

It appears to the writer that the citrus grower should clearly recognize that he is a citrus grower primarily and that nothing must be done in the grove that is even remotely likely to injure it. The citrus grove is a long time crop and the investment in it too great to jeopardize. There is undoubtedly no doubt but that in young groves up to possibly five or six years of age certain intercrops can be grown without injury to the trees and probably at a profit. Such intercrop, however, should be selected with caution. Foremost among such crops we would rank the bean, but it is too late now to plant beans in a grove and have them mature in time to plant a winter cover crop to advance age. At this late period in the year it is thus questionable whether it will not be best in the long run, even in young groves, to direct the attention to growing the necessary green manures to keep the grove in good condition, waiting for the longer period next summer to grow the intercrop.

After the groves have reached an age of eight or ten years, the writer feels pretty strongly that the greatest revenue to the grower and the greatest good to the grove will result in using such space as is available in growing green manures to turn under, thereby saving on the fertilizer bill. Unless we reach a condition of great extremity as a result of the prolongation of the war, probably the attempt to intercrop groves would not be justified, and such a critical condition of trust is not likely to occur.

## Weekly Market Review of Fruits and Vegetables

Kansas City, August 7, 1917.

### Potato Market Unsettled

During the middle of this past week, July 31 to August 7, potato prices declined to the lowest level of this season, due primarily to diminished consumption during the recent very hot spell. However, the hot weather also decreased shipments and the supply so that prices in producing sections are now advancing to a level considerably above that of a week ago. Today f.o.b. prices of \$3.00 to \$3.25 were reported from the Eastern Shore of Maryland and Virginia sections. New Jersey shipments amounted to only 131 cars this past week as compared with 1061 cars for the corresponding period a year ago. Potatoes from Eastern Shore of Maryland and Virginia which form the bulk of the shipments, are jobbing \$2.25 to \$4.00 per barrel in most markets with some selling as high as \$4.75 to \$5.00 on Western markets. The total potato shipments for the past week were 2031 cars, or about 700 less than the previous week.

### Cantaloupe Shipments Heavier

Cantaloupe shipments were about 350 cars heavier this past week than the week previous. Turlock, California, is now the heaviest shipping section. Turlocks are the best quality cantaloupes on the market and are bringing good prices, jobbing at \$3.25 to \$6.00, as compared with \$1.50 to \$3.25 per crate last year during the corresponding period. F. O. B. prices of Turlocks are \$1.40 to \$1.45 as compared with \$1.50 to \$1.90 per crate

a week ago. F. O. B. prices of Arkansas cantaloupes have also declined, and they are jobbing at \$2.00 to \$3.75 compared with \$1.50 to \$1.75 last year at the corresponding time. The Arizona season is now about over. Shipments from that state to date have been 1209 cars as compared with 88 cars last year up to the corresponding time and the total for the season.

### Peach Prices Hold Firm

Arkansas and Texas peaches have varied little in price this past week from the price of a week ago. Arkansas are jobbing at \$1.50 to \$4.00 compared with \$1.75 to \$3.25 last year for the corresponding period. The total movement of peaches this past week has been 1111 cars, or about 100 cars less than a week ago. Texas is nearly through shipping, with total movement to date from that state 77 cars as compared with 1716 cars last year up to the corresponding time.

### Busy Watermelon Week

This past week 2954 cars of watermelons reached market as compared with about 2123 cars last year at the corresponding time. Despite the heavy shipments and the fact that many cars arrived overripe, the weather has stimulated consumption so that prices advanced in the past week. Georgia, Texas and South Carolina have been the heaviest shipping states. The Missouri movement is now starting with 163 cars this past week as compared with 798 cars to the corresponding time last year. Up to date 163 cars have been shipped from that state as compared with 140

last year to the corresponding. It is estimated that the production for the state will be about 35 per cent less than last year.

#### Fruits and Vegetables

**Tomato** shipments for the past week of 560 cars, a few more than the previous week. New Jersey was the largest shipper, with 224 cars. However, shipments from New Jersey are behind last year. The shipments in that state to date have been 1591 cars as compared with 1591 cars corresponding date last year. Most markets at present are supplied with tomatoes from nearby producing sections.

**Massachusetts** began shipments of this past week, and with a view movement from Washington total for the week amounted to 155 cars as compared with 155 for the previous week. The Kentucky season practically ended. Prices have remained about the same with no improvement in demand.

## Government Crop Report

**SUMMARY** of the August crop report for California and the United States, as compiled by the bureau of crop estimates, United States department of agriculture:

**Wheat:** August 1 forecast, 2,580,000 bushels; production last year (December estimate), 2,048,000 bushels. United States: August 1 forecast, 2,000,000 bushels; production last year (December estimate), 2,583,241 bushels.

**Wheat:** August 1 forecast, 6,530,000 bushels; production last year (December estimate), 5,600,000 bushels.

**Wheat:** August 1 forecast, 6,530,000 bushels; production last year (December estimate), 639,886,000 bushels.

**Wheat:** August 1 forecast, 7,010,000 bushels; production last year (December estimate), 6,500,000 bushels.

**Wheat:** August 1 forecast, 38,400,000 bushels; production last year (December estimate), 33,320,000 bushels.

**Wheat:** August 1 forecast, 5,120,000 bushels; production last year (December estimate), 3,263,000 bushels.

**Wheat:** August 1 forecast, 5,120,000 bushels; production last year (December estimate), 3,263,000 bushels.

**Wheat:** August 1 forecast, 5,120,000 bushels; production last year (December estimate), 3,263,000 bushels.

**Wheat:** August 1 forecast, 5,120,000 bushels; production last year (December estimate), 3,263,000 bushels.

**Wheat:** August 1 forecast, 5,120,000 bushels; production last year (December estimate), 3,263,000 bushels.

**Wheat:** August 1 forecast, 5,120,000 bushels; production last year (December estimate), 3,263,000 bushels.

**Apple** shipments for the past week were slightly less than a week ago, totaling 206 cars. New Jersey, the heaviest shipper this past week, has moved only 97 cars to date as compared with 249 cars up to the corresponding time last year.

**Colorado** and **Iowa** were the principal shippers of cabbage this past week, although most markets of the country were abundantly supplied with nearby stock. Iowa cabbage is selling today, f. o. b. points in that state at \$15.00 per ton.

**New York** shipped 100 cars of lettuce this past week, with no other state shipping a large quantity. To date New York has shipped 639 cars as compared with 253 cars last year up to the corresponding time.

**Pear** shipments for the past week amounted to 598 cars, or about the same as a week ago, but about 175 cars less than last year for the corresponding time.

## Crop Report

#### All Hay

State: August 1 forecast, 4,900,000 tons; production last year (December estimate), 4,615,000 tons.

United States: August 1 forecast, 100,000,000 tons; production last year (December estimate), 109,786,000 tons.

#### Apples (Agricultural Crop)

State: August 1 forecast, 1,840,000 barrels of 3 bushels; production last year (December estimate), 1,918,000 barrels.

United States: August 1 forecast, 62,600,000 barrels of 3 bushels; production last year (December estimate), 67,415,000 barrels.

#### Peaches

State: August 1 forecast, 10,080,000 bushels; production last year (December estimate), 8,808,000 bushels.

United States: August 1 forecast, 426,900,000 bushels; production last year (December estimate), 36,939,000 bushels.

#### Cotton

State: July 25 forecast, 57,000 bales; production last year (Census), 43,620 bales.

United States: July 25 forecast, 11,900,000 bales; production last year (Census), 11,449,930 bales.

#### Beans

State: August 1 forecast, 6,480,000 bushels; production last year (December estimate), 4,175,000 bushels.

United States: August 1 forecast, 19,400,000 bushels; production last year (December estimate), 8,846,000 bushels.

#### Sugar Beets

State: August 1 condition 90, compared with the ten-year average of 90.

United States: August 1 condition 90.3, compared with the ten-year average of 89.3.

#### Oranges

State: August 1 condition 45, compared with the ten-year average of 87.

United States: August 1 condition 47.4, compared with the ten-year average of 84.3.

#### Lemons

State: August 1 condition 55, compared with the ten-year average of 87.

#### Apricots

State: Production, percentage of full crop, 70, compared with the six-year average of 72.

#### Prunes

State: August 1 condition 95, com-

pared with the six-year average of 76.

#### Almonds

State: August 1 condition 64 compared with the six-year average of 75.

#### Olives

State: August 1 condition 67, compared with the six year average of 83.

#### Walnuts

State: August 1 condition 80, compared with the six-year average of 83.

#### Hops

State: August 1 condition 95, compared with the ten-year average of 91.

United States: August 1 condition 95, compared with the ten-year average of 88.4.

#### Prices

The first price given below is the average on August 1 this year, and the second the average on August 1 last year.

State: Wheat, 205 and 96 cents per bushel. Corn, 173 and 92. Oats, 74 and 50. Potatoes, 128 and 140. Hay, \$15.50 and \$12.00 per ton. Cotton, 34 and 26 cents per pound. Eggs, 34 and 26 cents per dozen.

United States: Wheat, 228.9 and 107.1 cents per bushel. Corn, 196.6 and 79.4 cents. Oats, 73.7 and 40.1 cents. Potatoes, 170.8 and 95.4 cents. Hay, \$13.42 and \$10.68 per ton. Cotton, 34.3 and 12.6 cents per pound. Eggs, 29.8 and 20.7 cents per dozen.

#### PLANT YOUR WHITEFLY FUNGUS

The college of agriculture of Florida announces that: "Summer rains having begun, citrus growers should spray their trees with red whitefly fungus, or red Aschersonia, says E. W. Berger of the state plant board, with headquarters at the University of Florida.

"The board has 2000 pure cultures of the fungus available, enough to supply the growers throughout the state, and can fill orders as fast as they are received. A charge of 50 cents a culture is made to cover the production cost, the buyer paying transportation charges. One culture packed for shipment weighs about a pound, and is sufficient to spray an acre of grove."

#### ALFALFA GROWERS' ASSOCIATION

The Alfalfa Growers' Association of Southern California is now selling No. 1 alfalfa hay at \$21.50 f.o.b. cars, Los Angeles. No. 2 alfalfa is selling around one dollar lower. There are 125 members of the association and the number is increasing. It is thought the association will soon represent about 8000 cars of alfalfa. The activities of the association cover San Jacinto, Perris, Arlington, Corona, Chino, Ontario, Wineville and Riverside.

There has been published a most useful and handy little volume of 48 pages, Booklet 272, "Roster of the 65th congress of the United States," published by the American Protective Tariff League, New York. It contains a full list of the senators and representatives of the 65th congress, and the congressional tariff committees.

## Lye Peeling

By Claudia Murphy

**P**ARING peaches, pears and plums with a knife cuts off and wastes a considerable amount of fruit even with the most careful and skilled paring, and careful paring takes a lot of time. Experts say the fruit next

and plums by dipping in hot lye solution is approved by the United States government board of food and drug inspection which reports that lye peeling has no bad effect on the quality or flavor of the fruit and is not contrary to the requirements of the

Lye Peeling

Dipping fruit into the lye mixture is the easiest, most wholesome and economical method of peeling peaches, pears or plums—Note the method, please, and save your hands, fruit and labor.

to the skin has the finest flavor, and this part is cut off and thrown away with the skin when a paring knife, however sharp, is used. The use of the paring knife adds unnecessary labor and is far less cleanly than when lye is used. So peel these fruits with lye.

The process of peeling peaches, pears

and plums by dipping in hot lye solution is approved by the United States government board of food and drug inspection which reports that lye peeling has no bad effect on the quality or flavor of the fruit and is not contrary to the requirements of the

food and drugs act known as the pure food law. Lye peeling saves time, fruit and trouble, is wholesome, rapid, cleanly and economical.

All you need is a good iron kettle big enough to hold plenty of water, a wire basket with side handle preferably, to hold the fruit.

To nine gallons of cold water add

half a can of lye and a half ounce of alum. Bring to a boil. Have kettle large enough so that it is not over two-thirds filled with the water—this for safety to prevent splashing of the hot solution when the fruit is plunged into the kettle.

When the mixture is boiling, lower the fruit into the boiling solution in a wire basket container or in a thin but firm cloth such as a cheese cloth. For smaller quantities of fruit, use four tablespoons lye to one gallon of water with a pinch of alum added.

Let the fruit remain two minutes in the hot lye solution, then put it through two cold water baths to thoroughly remove the lye, and in the second bath of cold water rub off with the hands the small pieces of fruit skins that sometimes persist in clinging to the fruit.

### NURSERYMEN'S CHARGES FOR BOXING

**A**T the recent meeting of the Pacific Coast Association of Nurserymen held at Tacoma the matter of grading charges for boxing, baling and credit called forth a resolution:

That apple, pear, cherry, peach, apricot and almond trees be graded in grades No. 1, 4—6 ft. Calip., 1/2-in. No. 2, 3—4 ft. calip., 3/8-in. Plums and prunes: grade No. 1, 6—8 ft. Calip., 9-16-in. No. 2, 4—6 ft. Calip., 1/2-in; No. 3, 3—4 ft. Calip., 3/8-in.

That all 6—8 and 4—6 ft. 1 and 2 year stock be tied 10 in a bundle and all smaller grades in numbers of 25. Smalls, including strawberries, in bundles of 50 each, except in case of extra large stock which may be tied 25 in a bundle. Two year and 6-8-ft. stock should be tied with three strings. Other grades of trees with two strings. Each bundle should be plainly labelled with number, variety and grade.

Unless otherwise ordered, all boxes should be paper lined and charges made for same as per following schedule, with a discount of 10 per cent if unlined: 12-in by 12-in. by 8-ft. \$1.50, additional lengths 15 cents per foot. Larger sizes proportionately higher.

Terms of payment and credit are: 60 days net. Discount of three per cent for cash received with order and discount of two per cent for cash within 30 days. All bills become due and must be paid by June 1 or interest accrue from then or any prior date of maturity.

### WHERE FRUIT TREES ARE PROPAGATED

Continued from Page 147

Florida or along the bayous of the Gulf of Mexico. These are called the sour stock, or bitter orange. Time was when this seed was extracted by rotting down whole fruit. When the tissues were entirely softened under the process of decay it was mashed and thrown on a screen, when with strong pressure from the nozzle water was used to drive the pulp through the screen, leaving the seeds washed clean. Today the usual method is to run the fruit through a crushing machine, the pulp and seeds being all thrown on mesh or screen and the seed washed free of the pulp the same as with the other method. If for immediate planting drying is not necessary, but ordinarily they are partially dried, though some keep in water which is freshened daily. The seeds are very tender and must not be bruised or injured.

Formerly the seed were planted in lath houses, but now Mr. Teague's nurseries plant entirely in the open field. The trees are hardy and take

on more satisfactory growth after being transplanted to nursery. Planted in March or May they given plenty of water for one year and husky young plants result. They are taken the next year, put in a nursery row, one year's growth is given then they are budded and another year's growth makes them ready for the market. It requires one or two years longer to produce a citrus tree than it does a deciduous tree.

Calling for the most careful work is the last year of growth. After budding the two year old seedling the dormant bud is watched to see as to whether it has "stuck," and of course the waxed cloth or twine is moved before growth begins, or jury results. As soon as the dormant bud shows signs of starting some nurserymen cut the seedling top entirely off; some will break over or red the top growth so as not to shock the young tree.

As soon as the growth of the young bud starts a lath or stake is driven close, and almost inch by inch as the young bud grows, it is tied to the stake, for "As the twig is bent, the tree's inclined," and the careful orange grower who may be asked to pay 75 cents or a dollar or two dollars for a single tree wishes a perfect tree. We have walked along rows of Mr. Teague's nurseries where literally hundreds of thousands of trees were ready for market and perfect uniformity obtained as to size and form.

Just over the Los Angeles County line in San Bernardino County are the Armstrong Nurseries. The office and sales yard are almost in the center of Ontario on the world famous Euclid Avenue, 200 feet wide, 15 miles long from Chino hills to San Antonio canyon, with four rows of shade trees, roses and other shrubs making every mile of it a delight. Mr. Armstrong has chosen a beautiful setting for the headquarters of his nurseries which require some 300 acres farther out. The Armstrong Nurseries grow citrus trees, more of roses, ornamental and other trees. The economic importance of avocados is appreciated and many varieties are budded. The growing of olives is a specialty. The conditions of climate and soil existing are favorable to the growing of a good nursery tree, the loamy soil is ideal for producing a good root system. The advance of digging and shipping of trees are usually pruned back two or three feet which, with proper planning and immediate irrigation means "100 per cent stand."

At one time Mr. Armstrong made a large business of mailing roses—has 250 varieties—to Eastern purchasers. The mail order business is now secondary to the larger order which come from wholesale and local business.

All in all the nursery business in California is large and means much to the orchard and commercial interest. The men who have given freely their time, energy and capital, even their lives, are worthy of credit for adding to our prosperity.

### PLAN TO FUMIGATE

Fumigation has begun in many citrus orchards. "The heat has killed the scale" is realized to be only partially true. Investigation shows a limited hatch now coming off so the perpetuation of the species is assured. But sure it is the earlier hatched but got theirs and that creates a situation which makes possible a clean up, at least practically a clean up.

Cyanide is high; labor is high; and will fruit be high—that is high quality fruit will be. Every possible advantage must be taken to put orchards and fruit, the little we have, in best condition.

# Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper, sign full name and address. Unreplied communications receive no attention.

## Evil in Beans

Can you give me any information regarding a pest called the bean evil? It is said to attack the blossoms of the growing plant, nipping the young bean off at its base, thus ruining the crop. I would like to know if there is such a pest and what the surest way to destroy it.—Subscriber, San Bernardino.

There is no treatment within economic bounds for the pest while the beans or peas are growing in the field, as soon as the crop is harvested should be placed in gas tight bags, bins or rooms and carbon bisulphide at the rate of a pint to every 100 cubic feet of space in the container should be placed on top of the beans in saucers or other vessels. The

large spiny fruits are often seen in rubbish heaps. At the first successful settlement in America—Jamestown, Virginia, 1607—it is said that the men ate these thorn-apples with curious results. Capt. John Smith's account of their mad antics is very entertaining. It has been conjectured that this same plant was used by the priests at Delphi to produce oracular ravings. The seeds of *D. sanguinea* are said to have been used by Peruvian priests that were believed to have prophetic power."

## Apricots Rotting

In regard to apricots rotting on the trees would say that I think people are cultivating around their trees too much instead of allowing humus to accumulate in nature's way. Other fruits and crops are also suffering from this clean cultivation.—Robert Stone, Santa Paula.

We may add that experts do not

secured of any lime company; often it may be secured from farmers who have located rock crushers for making available their lime rock. Lime-rock or air slacked lime may be applied before plowing. If turned under more immediate results are secured. The action of the limerock is slower than that of the air slacked, but is less liable to injure and is sure in time.

## FAIR DATES

After part of the pages for this issue were printed we have word from Cultivator Field Man Briggs: "Fair dates wrong, Kings County at Hanford should be September 17-22. Fresno, September 25-29."

## YOUNG PIGS MAKE QUICK GAINS

"By feeding the young porker through the mother and later directly from the trough he can be marketed a month earlier and return a greater profit. To this end the sow should be given all the good milk producing feed she will eat. When the pigs are a month old or younger they should be fed skim milk in a shallow pan.

Then a slop made of milk, shorts, bran and a little tankage should be given. The little pigs should be fed in a creep which shuts out the sows or other pigs. Corn can be added to the ration later. There will be no trouble from thumbs if the pigs are given plenty of exercise.

The use of a self feeder will help in the labor problem, but a self feeder needs replenishing just the same as the feed bin.

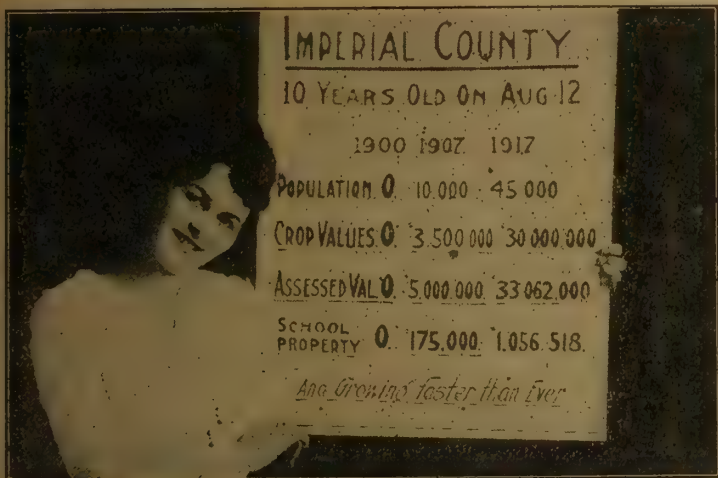

With the pigs on some legume pasture, little tankage or middlings is necessary.

## Special Offering in GUERNSEY BULLS

No. 1. Monograms Prize, No. 43094. One year Sept., 1917. Grandson of the Famous bull, Sequels Monogram. His dam full sister to cow with six hundred pound fat record. An exceptional individual. Price \$150.  
No. 2. A Monogram, No. 43989, 11 months old. 75 per cent blood of Katonahs Monogram, a son of Sequels Monogram and the famous transmitting cow, Nancy Mac. Good individual and fine color. Price \$125.

Address

Frank Reed Sanders, Mesa, Ariz.

Imperial County's 10th Birthday

Note what the young lady says as to population in 1900, again in 1907, and again on the county's 10th birthday which was last Sunday.

being much heavier than air, as vaporizes, forces itself down through the beans, and if the treatment is thorough, the gas being condensed 24 hours or longer, every one of the weevil will be killed. Then of course beans should be stored in tight rooms or boxes so as to prevent reinfestation.

## Immune to Oak Root Fungus

I have recently lost a fine pepper from oak root fungus. Peppers are very susceptible to this disease. Are there any quick growing ornamental shade trees which are immune to it?—Subscriber, Vacaville.

This question was submitted to Theodore Payne and others and all have said it was probable the eucalyptus is immune to this pest. What other trees are immune we are not informed.

## Jimson Weed

Would like to ask regarding jimson weed. There is a weed which grows here, rather a bushy plant with large leaves and large white flowers, which I think must be it. When matured it has a pod full of seed. Think it could be easily grown if there were market for it.—Subscriber, Vallejo.

Your description is a very good one for jimson weed. Regarding this weed, the datura stramonium, Bailey's new Standard Cyclopaedia of Horticulture says: "D. stramonium is the thorn-apple or Jamestown weed, the latter name being corrupted into jimson weed. Its foul, rank herbage and

agree as to the cause of this splitting and rotting of apricots. It is generally thought, however, that the rotting is an incident to the splitting, exposing the tissue of the fruit to the attacks of fungus.

## Mallow

I send portion of a weed and would like to learn its name.—Subscriber, Selma.

This was submitted to a botanist who named it *Malvastrum Fendleri*, one of the common mallows of Arizona and probably an introduced plant in Fresno.

## Supplying Lime

Will you please let me know when would be the best time to put lime on the soil. I intend to have it plowed before the rains set in. My soil is gravelly 'dobe'. Would it be best to have lime put on before or after it's plowed?—Subscriber, Morgan Hill.

Air slacked lime may be had of large lime concerns at a nominal price, but care should be taken in applying to be sure it is air slacked; if there is much of the caustic stone lime, the burning out of the humus lessens the real value of the soil. A question like this calls for examination of the soil to be sure to make the proper recommendation. It is possible that gypsum might prove better than lime or limerock, but if this "gravelly 'dobe" contains no alkali we believe the best general recommendation that can be made is to apply lime-stone ground very fine. This may be

The entire state of California is becoming aroused to the great need of IRRIGATION to turn its many arid acres into profitable food producing soil. The daily papers are urging IRRIGATION. People are talking IRRIGATION and thinking IRRIGATION and many are planning on putting in a system of IRRIGATION.

The first essential for a successful IRRIGATION system is to obtain a first-class pipe that will not prove defective after a few season's use, that will not be a source of continual expense for repairs, and a pipe that will not involve an enormous first cost.

# Remco Redwood Machine Banded Pipe

has demonstrated its usefulness, its long life and freedom from upkeep cost on many hundreds of farms and ranches.

MADE FROM CLEAR AIR-DRIED REDWOOD, WOUND WITH HIGH-GRADE SPECIAL PIPE WINDING WIRE, AND GUARANTEED BY THE MAKERS. IT WILL OUTLAST THE SO-CALLED "CHEAPER" PIPE AND PROVE A PROFITABLE INVESTMENT.

## Potato Storage

THE primary purposes of storage are to protect the tubers from extremes of heat and cold and from light. Account also must be taken of conditions of humidity and ventilation and of the size of the storage pile.

The temperature should be the highest at which potatoes can be maintained firm and ungerminated, and which will at the same time hold fungous diseases in check. Experiments of the United States Department of Agriculture with artificially refrigerated storage indicate that 36 degrees Fahrenheit is sufficiently low for all practical purposes and that in the earlier portion of the storage season a temperature of 40 degrees Fahrenheit is just as satisfactory as a lower one except where powdery dry rot infection occurs.

All natural light should be excluded from potato storage houses, because when the tubers are exposed to even modified light they are soon injured for food purposes. A practical rule in regard to humidity is to maintain sufficient moisture in the air to prevent the wilting of the tubers and at the same time to keep the humidity content low enough to prevent the deposit of moisture on the surface of the tubers.

If potatoes are piled in too large piles they may become overheated and deteriorate. Six feet is a good maximum depth to which to pile tubers in bins, and the area covered by each pile also should be limited. A good plan is to insert ventilated division walls at intervals through the pile or bin. These may be made by nailing relatively narrow boards on both sides of 2 by 4 uprights, 1-inch spaces being left between the boards. General ventilation for the whole storage

house usually is accomplished through ventilating shafts in the roof.

### Methods of Storage

The possible ways to store potatoes are pits, or earth-covered piles, dug-out pits or potato storage cellars, insulated wooden structures, substantial masonry or concrete houses, and artificially refrigerated storage houses. The latter two methods are the most expensive. Pitting is the most primitive method of storage, but if properly done on well-drained locations is satisfactory in so far as the preservation of the potatoes is concerned.

### Storage Cellars

The dugout pit or potato storage cellar is probably more widely used than any other type of storage space. Fitted with water-tight roof it is especially popular in the central portions of the United States. In the arid and semiarid sections a type with sod or dirt roof is in most general use. As a rule, the excavation for the cheaper structures of the dugout pit or cellar type when erected on level or nearly level land does not exceed three feet. The soil removed from such an excavation, particularly if the dugout is of any considerable size, is ample for banking the side and end walls and also for the roof. The cost of construction may be greatly modified, according to the character of the location.

In the cheaper dugouts, where the soil is of such a nature as to remain intact it is allowed to form the side and end walls, the roof being supported on plates resting on the soil and held together by boards or joists. This form of construction involves a deeper excavation and a constant element of risk from a cave-in. In the more expensive and substantial structures the side and end walls are built of concrete.—Bulletin 847, U. S. D. A.

## Root-Knot

Nearly all Florida truck crops are susceptible to root-knot, known also under the names of root gall, big root, etc., this disease does immense damage every year. The presence of it is not always readily apparent. Badly infested plants are dwarfed, wilt readily in hot, dry weather, and are usually a paler green than healthy ones. With less severe attacks, these symptoms are not always noticeable and the reduced yield may be thought by the trucker to be the normal yield for the season.

When there is any reason to suspect the existence of root-knot, the roots of the plants should be examined. Irregular swellings of the roots will indicate the presence of the disease.

"These swellings are caused by minute worms which belong to the group commonly known as eel-worms or round worms, and technically called nematodes," says J. R. Watson of the University of Florida experiment station, in his bulletin 136 on the control of root-knot, recently published. These nematodes can be killed by the proper application of calcium cyanamide or "cyanamid" to the soil, at a moderate cost. The bulletin gives the results of several years of experiments conducted by Mr. Watson, and includes recommendations covering the treatment under varied conditions.

A good time to apply the remedy is just before the rainy season, and truckers who find it impossible to grow crops profitably on their soils

infested with the nematodes may find this treatment both profitable and practicable.

The swellings on the plant roots seriously interfere with the passage of water from the roots to the stem and leaves, which results in the stunted and inferior growth made by the plant. Also, the entrance of harmful fungi or bacteria into the plant is made easier. In the case of cotton, for example, the root-knot parasite may be present in such small numbers as not to cause much harm itself, but may prepare the way for wilt or black root, a fungus disease.

The bulletin is free and may be had by addressing the Experiment Station, Gainesville, Florida.

The above is the announcement of the Florida station and the last paragraph applies to citizens of Florida, but no doubt if California growers enclose postage with request the bulletin will be mailed here.

### MAKE GARDEN PRODUCE

To make a small area produce a large amount of food, not only every foot of available space must be utilized, but late crops must be planted as soon as the earlier plants have been removed. To carry on gardening in this intensive way requires careful planning in advance, and it is recommended that a detailed diagram of the garden be drawn up and the various uses that it is planned to put

each portion to, throughout the growing season, be clearly indicated. This plan the success or failure of various enterprises should be noted and the plan itself kept as a guide for the following year.

## Legal Queries

Louis B. Stanton, attorney, 243 Will Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Angeles.

### Deer Destroying Crops

I have been troubled for seven years by deer destroying my crop. They are mostly does and fawns. They destroy the young trees, and it is impossible for me to raise melons, pumpkins, or sweet potatoes. I have chased them with dogs and shot scared them and written to the local game warden, all with no effect. They are becoming worse every year. What is my best means of procedure? Subscriber.

The deer laws are very strict and there is no exception which can be found applicable to your case. A fence laws would give you no protection even against trespassing cattle unless your fields were securely fenced, in which case you doubtless would have no trouble from deer. You might take the matter up with the state fish and game commission, Sacramento. Your best method would be to securely fence your property.

### Fixtures

In selling ranch where no personal property was included in sale does any of the following pass to the purchaser: Hay carrier, cable ropes, watering trough in corral not attached, globes on chandeliers in house, linoleum on kitchen floor?—Subscriber.

The rule with respect to what are and what are not fixtures differs in many respects with the relations between the parties who raise the question. Between vendor and vendee, the rule is construed strongly against the vendor, and whatever is essential for the purposes for which the building is used will be considered as a fixture, although the connection may be such that it may be severed without physical injury to either. Whatever the vendor has annexed to the property for its convenient use and improvement passes by his deed. The above rule applied to the case in question would include the hay carrier with appliances to enable it to be used; also would probably include the watering trough. It has been held that chandeliers themselves were fixtures. It has also been held that they were not. It is possible that the globes would not be fixtures unless attached by nails, bolts, or screws. The linoleum would be considered a fixture under no circumstances.

### Fixtures Again

Can improvements, such as barbed fences and pumping plants, placed on the property after the mortgage is made, be removed if the mortgage forecloses?—Subscriber.

Generally speaking, annexations to the realty become subject to the lien of the mortgage whether affixed before or after the execution of the mortgage. If the above mentioned improvements come under the definition of fixtures they are undoubtedly subject to the lien of the mortgage; they are fixtures if they are embedded in the land, as in case of walls or permanently resting upon it, as in case of buildings, or permanently attached to what is thus permanent, by means of cement, plaster, nails, bolts, or screws.

# Ornamental Garden Notes

Written for California Cultivator By E. Braunton

## Worms in Lawns

Many complaints have come to me respecting round spots in lawns where grass has died and no cause could be determined. These spots are sometimes caused by canine urine but are known where no such cause is possible. It is believed the trouble came from worms, possibly the grubs of the May beetle common in the East but much less so in California. It is believed that a half ounce of corrosive sublimate dissolved in 15 gallons of water and sprayed on the lawn will at once remove the cause of the trouble. It may also be done by a spray of lime water, ten pounds of fresh lime to 25 gallons of water. This may, or may not, be allowed to settle before application. In either case the worms will come to the surface. The lime water has good use for lawn or garden.

## Eucalypti in Scotland

We have it from a reliable English garden magazine that on the Scotch estate of Secretary Balfour there is a large eucalypt which when small was brought from Ballarat, South Aus-

tralia by the late Lord Salisbury. It was given the specific name of Whittinghami, after the estate, but of course this counts for nothing, and we do not know what eucalypt it is. But the fact that a large-growing species is hardy in East Lothian is worthy of record. These facts, of trees hardy in various parts of Europe, attaining considerable size, lead us to believe that we have not sufficiently determined the hardiness of all species for intelligent use in California.

## Timely Garden Work

Sow seeds of perennials now, such as columbines, larkspurs, and snapdragons and about September 1 put in the first crop of sweet peas or sow the latter any time in September or October. The results are always good as sweet peas thrive best when the soil is cool. If cool weather prevails or if near the coast the first planting of Dutch bulbs may be done, but if any doubt exists leave them for another month. Freesia and Calla bulbs should both be dry and out of the soil now. In another month they may be replanted.

# Sending Flowers by Mail

The following suggestions for preparing flowers to send through the mails are given by L. H. Cobb in the New Yorker:

Flowers should be cut in the morning before the sun has had a chance to disperse the dew. Place in a box of water in a cool place for at least 12 hours to soak up as much water as they will. Almost any kind of box that is large enough so the flowers will not be crowded will answer, but we need a supply of waxed paper. Line the box first with ordinary paper, then with the wax paper. If you want to finish it off nicely you will use a sheet or two of white waxed paper.

If the flowers are only to be on the way a day or two it is seldom necessary to wrap the stems in any damp substance. I usually place them carefully so the heads of the second row just under the first row, and the third row just below that, using the stemmed flowers first. If it is thought best to have some moisture in the box more than the stems carry, use a white cloth and saturate it in water, wringing out until it is dripping in the least, and raise the stems enough to slip it under them. Cover them loosely, and if the flowers and their stems are delicate it is best to sew a cord down through the bottom of the box to prevent the flowers from forcing the heads of the flowers against the end of the box should it be thrown so it struck on the end of the box with the flowers down and the stems up. Fold the coverings in neat order, first the tissue, then the wax and finally the heavier lining.

The only trouble is in getting a box that will not be crushed. Corrugated boxes are safest. Wrap the box in paper. Have the words "Fresh Flowers" very plainly marked so they can be seen.

In selecting the flowers that will keep shipping choose such as have substance. Carnations or any of the pink family ship well. Roses are hard to keep fresh for a long time, but if they were cut when but partially blown and have been placed

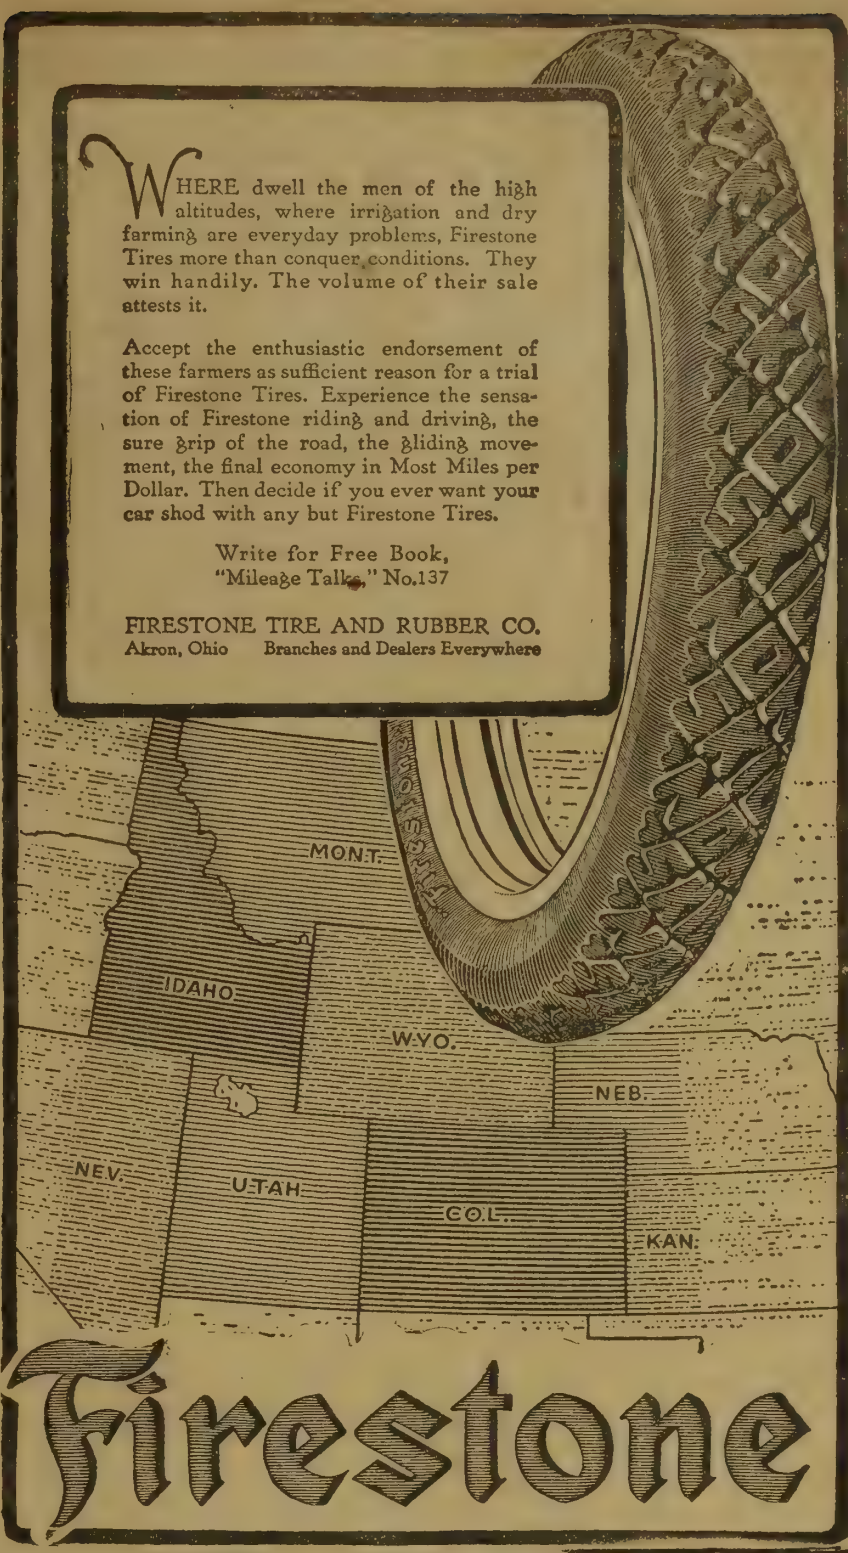

in water until the petals and stems are full they will not be so badly wilted but they will revive even when shipped considerable distance. Shasta daisies, pansies, sweet peas, violets, Gladioli, tuberoses, chrysanthemums can all be shipped reasonable distances. Flowers with silky texture that wilt easily at any time will not carry. There is little use in sending poppies, cannas, moon-flowers, or other flowers of like substance."

How to clean a car and keep it looking bright and cheerful is a problem that confronts every owner who prides himself on the looks of his machine. Cars will get dirty, gummy and scratched. The dirt and gum may readily be removed with turpentine, wood alcohol, soap and water and the like, and an application of wax polish will do much to give the newly cleaned car a new appearance. The owner must always be careful in polishing a car, however, to avoid anything that will tend to gum the surface.

A cooperative association must be democratic. Otherwise it will not continue to live. Many cooperative associations in the past have failed to recognize this. They have been so organized that one man or a small group has dominated their policies, controlled their business and even used the association for personal ends. They have been corporations and not true cooperative societies.

The early American colonies made several attempts to grow alfalfa, but without great success. George Washington grew trial plots of alfalfa on his Virginia farm, and Thomas Jefferson gave considerable attention and care to its cultivation. Their efforts, however, proved unsatisfactory, since they did not understand all of the requirements for the successful growth of the plant.

Community spirit is the nation's best asset when applied in the practical way, and like religion, it becomes better the more one works at it.

WHERE dwell the men of the high altitudes, where irrigation and dry farming are everyday problems, Firestone Tires more than conquer conditions. They win handily. The volume of their sale attests it.

Accept the enthusiastic endorsement of these farmers as sufficient reason for a trial of Firestone Tires. Experience the sensation of Firestone riding and driving, the sure grip of the road, the gliding movement, the final economy in Most Miles per Dollar. Then decide if you ever want your car shod with any but Firestone Tires.

#### OUR ADVERTISERS RELIABLE

We guarantee our subscribers against  
 loss through dishonesty of any adver-  
 tiser in the Cultivator. We do not at-  
 tempt, however, to adjust trifling differ-  
 ences between subscribers and honest,  
 responsible advertisers, nor will we pay  
 the debts of honest bankrupts. Notice  
 of complaint must be sent us within 30  
 days from date of the transaction, and  
 the subscriber must have mentioned the  
 Cultivator when writing the advertiser.

#### THIS WEEK'S COVER

Because of the need of the  
 farmer to move his crops with least  
 injury and greatest economy and be-  
 cause of the need of the tourist who is  
 no small factor in California's pros-  
 perity, there has been persistent ap-  
 peal for more and better roads in Cal-  
 ifornia. It is possible that the tour-  
 ists may not be so plentiful during  
 war times and that war may demand  
 conservation of gasoline, but there  
 are greater crops than ever to be  
 moved, and it has already been shown  
 that these good roads are a big factor  
 in military efficiency.

In any case California has worked  
 for and secured good roads and is  
 now enjoying them. May their length  
 increase.

#### MORE TRACTORS

In conversation with a breeder  
 of draft horses we were surprised to  
 learn that he contemplated retiring  
 from horse breeding. "Why?"  
 brought out the fact that present  
 prices of feed made present prices of  
 horses impossible. He believed that  
 the time would come when more  
 farmers would be exclusively tractor  
 farmers.

#### THE LABOR QUESTION

The Imperial Valley is taking  
 a sensible step in its effort to secure  
 some competent labor. A committee  
 has been appointed and has canvased  
 the valley to learn as to the needs  
 of farmers. It is proposed to raise  
 a fund through cotton gins and hay  
 balers which will collect 35 cents per  
 bale on cotton and ten cents a ton on  
 baled hay which will be used to bring  
 laborers into the valley.

The selective draft is taking some  
 of the most efficient workers from the

valley, which, in addition to the gen-  
 eral labor shortage, is making a most  
 serious situation.

#### HOT WEATHER

Some farmers have complained  
 because of the excessively hot weath-  
 er which has been given to us this  
 season, but as we have seen it ex-  
 pressed; "American farmers working  
 under American conditions should  
 think of the farmers of eastern  
 France who are cultivating their  
 lands under shell fire." American con-  
 ditions are not as bad as they will be  
 if we do not win this war and that  
 pronto.

#### JOSEPH SEXTON

One of California's best known  
 plant propagators and growers died at  
 his home in Santa Barbara County  
 last week. Joseph Sexton was one of  
 California's pioneers. He has grown  
 flowers and rare fruits in an experi-  
 mental way for many years. He was  
 greatly interested in avocado culture  
 and had an orchard with possibly the  
 greatest number of varieties of any  
 grower in California. He travelled in  
 other lands to learn of rare fruits  
 that might be introduced to Califor-  
 nia and has brought to this country  
 many of our best. He propagated and  
 introduced the soft shell walnut  
 which for many years was one of our  
 finest nuts.

Mr. Sexton's work is well known to  
 Cultivator readers through the arti-  
 cles which he has written for its  
 columns.

#### Nobody Home

Our state council of defense  
 has done some remarkably fine work  
 in urging greater production and  
 greater conservation, but apparently  
 the censor was off duty last week  
 when the council sent out the "copy"  
 in which it was recommended that we  
 should all keep a war goat which  
 would save on butter fat, etc. As to  
 cost of keeping:

"A goat will thrive and grow fat  
 and will produce from one to six  
 quarts of rich milk a day on a diet of  
 weeds, table scraps and such forage  
 as it can glean from being staked out  
 on a vacant lot; grain feed for goats  
 is unnecessary."

Six quarts a day is going some, but  
 when it's done on weeds, garbage and  
 vacant lots, even with baling wire and  
 can labels thrown in, we feel that  
 Mrs. Goat would get thin. It takes  
 feed to produce food.

Keep a war goat but bear in mind  
 nature abhors a vacuum.

#### HOGS HIGH

California swine breeders have  
 little interest in telegrams announcing  
 spectacular prices in Eastern mar-  
 kets. In the Imperial Valley the hog  
 raiser shrugs his shoulders and with  
 palms up simply remarks; "It means  
 nothing to me. Eastern prices affect  
 coast prices but little, and in any case  
 with feeders and feed at the present  
 prices what's the use?"

Here are a couple of clippings from  
 a recent paper:

CLEVELAND, Ohio, Aug. 10. — Hog  
 prices quoted at the Cleveland stock  
 yards today broke all records. They are  
 higher even than during the Civil war.  
 Hog prices throughout the list were \$7.50  
 higher than a year ago. Heavies and  
 mediums were quoted at \$17.50 today.

CHICAGO, Aug. 10.—Hogs brought a  
 new record price of \$17.00 today on the  
 Chicago market. Miller and Hart bought  
 some 220-pound specimens at that figure,  
 with the market price from \$16.00 to  
 \$16.75 per 100 pounds. There were 20,000  
 less hogs in the western market today  
 than there were a year ago.

In Portland where there are stock-  
 yards prices are only slightly under  
 Eastern quotations.

#### EXEMPTION

The daily press is openly charg-  
 ing favoritism on the part of the ex-  
 emption boards. In some cases, as  
 noted in Los Angeles, there are sec-  
 tions where homes of wealthy people  
 show far greater proportion of exemp-  
 tions because of dependents than oth-  
 er sections where there is less  
 wealth. In any case there seems to  
 be lack of uniformity in granting ex-  
 emptions. It was understood when  
 the law was passed that the selective  
 draft would exempt those who had de-  
 pendents and probably all agricultural  
 workers. Of course the prime object  
 of the selective draft is to secure an  
 army and permit proper support of  
 the army by the men behind, but  
 there certainly should be no oppor-  
 tunity for even the shadow of a politi-  
 cal pull or influence aiding in secur-  
 ing exemption.

As to agricultural exemption of-  
 ficials of eight national agricultural  
 organizations unite in the following  
 resolution addressed to exemption  
 boards: "Under the law, you are  
 given authority to exempt certain  
 classes of men who may be engaged  
 in labor which is just as important as  
 service in the army. We trust, there-  
 fore, and respectfully ask, as repre-  
 sentatives of the great agricultural  
 industries of the United States, that  
 experienced men, engaged in farm  
 work shall be the first to be set aside.  
 If the war should last several years it  
 may be necessary to organize farm  
 work to release many of our farmer  
 boys for army service, but in the first  
 call for one million men, practical  
 men engaged in agriculture should be  
 exempted."

#### TRESPASSERS

A Los Angeles County man, ex-  
 asperated by seeing his crops de-  
 stroyed by deer, proceeded to protect  
 his property by shooting the tres-  
 passers. He was arrested and, being  
 somewhat of a fighter, proposes to  
 test the case in the courts. Presum-  
 ably he will be fined and at least rep-  
 rimanded.

On page 152 of this issue note that  
 subscriber is asking what may be  
 done to protect young trees, beans,  
 melons, pumpkins and sweet pota-  
 toes from deer. Shooting with blank  
 cartridges, chasing with dogs and oth-  
 er means have been tried, but with-  
 out permanent protection. Attorney  
 Stanton answers that the deer laws  
 are very strict and that as they now  
 stand the only protection is a fence  
 sufficiently high to keep the deer out.  
 This means that the lands in question  
 must be devoted to the pasture of  
 wild game, for plainly a fence that  
 will keep out deer is beyond the  
 means of most farmers.

Mr. Stanton suggests that the mat-  
 ter might be taken up with the state  
 fish and game commission, but the  
 Los Angeles case indicates there  
 would be no protection afforded the  
 farmers.

A charge that our legislators and  
 fish and game commission in enacting  
 and rigidly enforcing such a law are  
 engaged in unpatriotic service may  
 not be strictly just, but when the  
 world is appealing for food and bean  
 fields are laid waste by game pro-  
 tected largely in the interests of  
 sporting people it is time for the  
 farmers to ask pointedly and serious-  
 ly who is responsible for these game  
 laws.

We believe that some of our game  
 birds when they are trespassing may  
 be shot by the farmer, but he must  
 neither market them nor eat them  
 from his own table. With deer it  
 seems the case is different, and no  
 matter how serious the loss they  
 cause to farmers they are compelled  
 to let the trespassers go uninjured or  
 suffer arrest.

#### Agricultural News Notes

The federal trade commission  
 begun its investigation of flour mak-  
 ing costs.

Naval training stations in Cali-  
 fornia are located at San Francisco  
 and San Diego.

All flour and grist mills in Great  
 Britain have been taken over by  
 government.

Western New York will ship 6  
 cars of peaches. The main crop  
 not be ready to move till September.

Iowa expects to produce near-  
 ly \$700,000,000 worth of crops this year.  
 Its largest increase is in corn, and  
 potatoes and garden stuff.

On the proposal of the food admin-  
 istration bureau the federal reserve  
 board has agreed to classify potato  
 among the non-perishable staples  
 that the reserve banks may loan  
 money to growers on warehouse  
 receipts.

The New York state legislature  
 struggling with food control bills. One  
 sponsored by Governor Whitman  
 provides for fixing minimum prices  
 for farmers, seizure of goods in ware-  
 houses where necessary, and other  
 radical measures.

Field tests in Missouri and Kansas  
 covering several years, show that  
 early plowing of wheat land produces  
 from four and a half to 13 bushels  
 more wheat than September plowing.  
 At present high prices of wheat this  
 would mean much money.

Alaska's trade with the United  
 States in the fiscal year just closed  
 set a new record, with a total of \$1,  
 000,000. Shipments from Alaska to  
 the United States were valued at \$  
 1,000,000, including \$15,500,000 in goods  
 and those from the states to Alaska  
 \$39,000,000.

In the big farm power demon-  
 stration held at Fremont, Nebraska, Au-  
 gust 6-19, it is stated that over \$1,000,  
 000 worth of tractors and other re-  
 lated appliances was exhibited. The  
 demonstration was held under the  
 auspices of the National Tractor  
 and Thresher's Association.

The high prices of foodstuffs have  
 tempted thieves to come into the  
 country with wagons and load up with  
 and other valuable produce to such an  
 extent that communities in many  
 parts of the country have organized  
 Farmers' Protective Associations to  
 deal with the law breakers.

A serious pest of the chrysanthemum,  
 the chrysanthemum midge, has been  
 spreading rapidly throughout the  
 United States the last two or three  
 years. Many florists report loss of  
 their entire chrysanthemum crop  
 from this cause. No satisfactory  
 method of control has yet been found.

A mass meeting of the dairy indus-  
 try has been called for Monday, Oc-  
 tober 22, at Columbus, Ohio, during the  
 National Dairy Show. The problems  
 and opportunities of the industry  
 arising from the peculiar world con-  
 ditions, will be discussed. The  
 national dairy cattle clubs and national  
 state dairy organizations join the  
 National Dairy Council in making the  
 call.

The use of railroad cars for pack-  
 ing fruit and other commodities  
 during the free unloading period  
 held by the interstate commerce  
 commission not a right of the shipper  
 but only a toleration by the railroad.  
 A test case was filed by the Nebraska  
 state grange and other growers' or-  
 ganizations to force the railroads to  
 allow use of their cars for this pur-  
 pose.

# Agricultural News Notes of the Pacific Coast

## Northern California

Hop picking began at Wheatland August 15.

Mendocino County reports some sales of hops at 17½ cents.

Fairoaks, Sacramento County, reports heavy planting of the fall crop potatoes.

Officers were elected at the last meeting of the Mt. George farm center, Napa County.

Hop growers are standing pat and most of them refusing 12½ cent offer on the 1917 crop.

Farm Adviser Lee of Alameda County is urging more efficient use of tractors available.

Pear blight has been prevalent this season, and the careful grower has done some very heavy pruning.

Anderson Valley, Shasta County, is peeling for 1000 pickers to aid in harvesting her 5000 tons of prunes.

Prof. Essig of the university department of entomology has been doing investigation work in Nevada County.

Serious fires have been burning in Colusa County, 1000 acres of wooded land having been destroyed near Sonoma.

J. P. Dargitz, one of the inspectors of the federal farm loan bank at Berkeley, has made appraisements at Paradise in Butte County.

Experiments being conducted by the Ukiah Irrigation District have demonstrated that excessive irrigation is being given to alfalfa lands.

Placerville Clings began filling the canneries at Gridley to capacity about the 1st of August. The force is now running full handed on peaches.

A public bean cleaner is to be installed at Sacramento. It will have capacity sufficient to handle the beans of the entire Delta district.

Ground has been broken for a new curing plant at Oroville, Butte County. It will be under the auspices of the California Olive Growers, Inc.

Placer County's fair will open on Monday and will be held for four days. Many exhibits are already scheduled. It will be held at Auburn.

The Placer County farm bureau has begun wire purchasing and marketing association which has saved money for its members. J. A. Teagarden is president.

The alfalfa meal mill at Orland, Glenn County, is shipping ground alfalfa to Eastern points. The mill is operating night and day and turning out 70 tons per day.

The state housing commission has made tour of hop picking yards and is insisting on clean, comfortable sleeping quarters, pure drinking water and general sanitary conditions.

The Central California Poultry Processors Inc., an organization which covers practically the northern end of the state, is organizing locals in Alameda and Santa Clara Counties.

Farm Adviser Baade of Napa County, who has also been manager of the county fair, has tendered his resignation in the latter capacity because of pressure of his duties as farm adviser.

Assistant Farm Adviser Martin has been working with Farm Adviser Lee of Alameda County, in establishing high school boys' camps and also in dealing in the labor situation of that county.

## Central California

Barley growers at Merced are selling at \$2.25.

A 400 acre vineyard at Dinuba recently sold for \$123,000.

California will ship in excess of 11,000 cars of grapes this year.

Tulare County paid out over \$4000 in squirrel bounties for June.

The Stanislaus county fair is to be held at Modesto, September 17-22.

The sugar factory at Visalia, Tulare County, has arranged its labor troubles.

Opening school date in Tulare County has been fixed at September 17.

Serious forest fire raged in the big tree forests of eastern Tulare County last week.

Red spider is causing serious damage in some peach orchards of the San Joaquin Valley.

The Lindsay Ripe Olive Company has leased its processing plant for a period of three years.

Poultry Expert Hauser of the university farm at Davis is holding a series of meetings in Stanislaus County.

Fresno gardeners and truck farmers are incensed at petty thievery, and the shotgun policy has been adopted.

Eradication of squirrels and jack-rabbits is being planned for by the horticultural commission of Kings County.

An El Centro creamery has installed a milk sugar plant. The sugar is made from the whey which formerly was dumped.

Farm Adviser Conner of Stanislaus County is urging spraying of almond trees for red spider, especially where beans are interplanted.

One San Benito County cattle raiser recently disposed of his herd of pure bred Shorthorns because "There are too many rustlers at work in that section."

The California Peach Growers are investigating the sulphur question and endeavoring to secure reduction of amount of sulphur used so far as possible.

Dates of coming meetings are; Wood Colony, August 20; Ceres, 21; Claus, 22; Mitchell School House, 23; Patterson, 24; Keyes, 27; Tegner and Mountain View, 28; Jennings, 29.

Awards have been made to contestants of the Selma pig club. Clarence L. Neilson took first prize, Clyde Browning second. The judging was done by C. W. Rubel of the state university.

Cantaloupe cars are iced at Modesto before being sent to Turlock for loading and receive the second icing on their way to market. It is estimated that between 40 and 50 cars will be iced daily.

The contract has been awarded for the new packing house of the Strathmore Fruit Growers' Association, to be built along the Santa Fe railroad. This new association is affiliated with the California Fruit Growers' Exchange. W. S. Shippey is manager.

The Valley Fruit Growers' Association has been organized at Fresno as a non-profit cooperative organization. Members elected directors are: Wylie M. Giffen, S. P. Frisselle, Frank Malcolm, P. H. McGarry, George C. Roeding, W. Flanders Setchel and M. F. Tarpey.

## Southern California

Packing houses are busy with dried apricots.

Brawley reports alfalfa worms doing considerable damage this year.

One hundred fifty acres have been planted to canning tomatoes in Hemet Valley.

Hemet had a thunder shower last week which did some damage to drying fruit.

Sugar beets are reported late in maturing this year and running to small sizes.

Heavy winds did some damage to peach orchards near Banning, Riverside County.

More than 1000 tons of apricots have been handled by the Gregory cannery at Colton.

Hemet, Riverside County, has been compelled to build additional fruit storage for its big crop.

Beekeeping and honey exhibits will be made an especial feature at the Riverside fair, October 9-13.

One packing house at Santa Paula, Ventura County, will pay a \$20,000 labor bill because of packing apricots.

The effort to discontinue the office of tree warden of Riverside County is being met by still stronger effort to continue it.

The county council of defense for Imperial devoted last Tuesday, August 14, to visiting day, calling at many of the farms.

The California Prune and Apricot Growers' Association fixed opening prices for apricots at a 15 cent basis, prunes at six cents.

The heat wave of June cut down the navel crop of the Hemet Valley severely. Valencias, Sweets and Bloods show better condition.

Joseph Sexton, pioneer fruit grower and introducer of new varieties of fruits, died at his home in Santa Barbara County last week.

Twenty-nine dollars and fifty cents per ton has been the contract price received for apricot pits this year, as against \$50 and \$60 in former years.

The Banning cannery closed its apricot run, having handled over 1000 tons. It is now at work on peaches from outside sections, the Banning crop being later than usual.

The olive cannery and oil mill at Lakeland will be moved to Riverside.

A number of negroes were brought into the Huntington Beach fields to replace striking Mexicans. Many of the strikers returned to work.

A recent field survey of beans in Hemet Valley by Deputy Horticultural Commissioner Ellis disclosed the fact that many beans have been planted in orchards where the trees were too large to allow the plants a chance to mature.

It is estimated that the Pomona-Ontario district will be richer by \$600,000 at least because of the apricot harvest. Two canneries at Pomona handled nearly 2000 tons of apricots, while three plants at Ontario handled over 2500 tons.

The Hemet packing house of the Prune & Apricot Growers' Association is ready for business in the packing house of the Orange Growers' Association. It will handle 300 tons of dried apricots, 100 tons being brought in from Elsinore.

## The Coast

Idaho farmers are refusing \$15 per ton for hay.

A grain elevator is being erected at Winona, Washington.

Yakima, Washington, is building a large fruit drying plant.

Pocatello Valley, Idaho, is making a 30-day campaign on hoppers.

The entire Northwest reports keen demand for hogs, especially feeders.

A 75,000 bushel grain elevator is being constructed at Hartline, Washington.

Two hundred fifty Belgian families have been settled on farms in Oregon.

One cannery at Lewiston, Idaho, handled 100 carloads of cherries this season.

Three hundred head of cattle have been poisoned near Klamath Falls, Oregon.

President Carranza of Mexico has appointed C. Dominguez, secretary of agriculture.

Arizona cattlemen and sheepmen report at least a 20 per cent increase over last year's output.

The Oregon state fair offers \$4,000 in premiums at the fair to be held at Salem, September 24-28.

A potato processing plant is being erected at Idaho Falls, Idaho, which will be ready for the fall crop.

Arizona has formed the Loyalty League, the avowed purpose of which is "to exterminate the I. W. W."

Idaho, Washington, Oregon and California have practically doubled their potato output in the last year.

Lewiston, Idaho, reports hottest and driest weather for 17 years, but that most of her bean crop is still growing.

A pool of 17,500 pounds of wool was recently formed near Boise, Idaho, and the wool sold at 63 cents per pound.

The Land Products Show is to be held at Portland this fall, at which \$4500 for premiums in land products are offered.

Farmers of Arizona are securing bean threshers and all labor saving machinery possible to handle an exceptionally large output.

Wenatchee Valley, Washington, is investigating as to apple storage and planning for holding the coming crop until satisfactory prices may be secured.

State Agricultural Commissioner Greenfield of Montana, has stated that it will be necessary to supply money to wheat farmers to buy winter seed because of the failure of this year's crops.

At a recent meeting of the California Cattlemen's Protective Association it was voted to contribute \$2600 to the expenses of the market committee of the American National Livestock Association.

Fires thought to be incendiary have destroyed a flour mill valued at \$150,000 at Klamath Falls, and dairy barns at Klamath Falls worth \$17,000. These have been charged by many to I. W. W. agitators.

The Northwestern branch of the federal farm loan bank at Spokane is rushing the chartering of associations and making of loans. The Northwestern District comprises Washington, Oregon, Idaho and Montana.

# Bean Growers Organization

Written for California Cultivator

**W**E have referred to the success of the California Lima Bean Growers' Association, composed largely of Ventura and Orange County producers. Growers of all kinds of beans in other sections felt the need this season of getting together to secure fair returns from the market and the matter was taken up by some of these growers of the San Fernando Valley with officers of the Lima Bean Growers' Association, and with Market Director Weinstock. A meeting was called in Los Angeles for last Friday, and a number of bean growers, almost exclusively from San Fernando, met with the market director and Manager Churchill and others of the Lima Bean Growers' Association. Mr. Jerome acted as chairman. Director Weinstock referred to the advisability—the necessity—of producers organizing in order to receive just returns. He stated that he had found the most difficult step in any cooperative movement was that of getting the farmers to sacrifice their own individuality and become members of a strong and powerful organization. He explained: "There is no use of raising stuff if you have no market, and you have no satisfactory market under ordinary conditions unless you are organized so you can seek the right market."

Manager Churchill of the Lima Bean Growers' Association outlined the working plan of his association. It is composed of a central organization which deals with subsidiary organizations. Of these there are eight in Ventura County and two in Orange County. The plan of organization is very similar to that of the walnut growers' association and it is that of a non-capital, non-profit corporation. Every member has equal power with every other in the matter of voting, whether he owns one or 1000 acres of beans.

No plan of advancing cash to members has been perfected by the association, but the plan of organization permits of arrangement with bankers who advance money at six per cent to members who wish advance on stored crops. As a rule warehouse receipts are not given but the grower practically places the institution advancing the money in the same position in the association as that held by the borrowing member. Thus far the association has been exclusively a lima bean association, but members who are growing blackeyes, pinks or small whites wish the association to market for them, and it is probable that the scope of the organization will be enlarged.

Under the present plan of work

each member contracts with his local association to take all of his coming crop. If he does not he agrees to pay a penalty of two cents per pound for every pound sold outside of the association. The local association in turn contracts with the central organization, which disposes of the crop as soon as marketing conditions are right. A general pool is maintained so that if one association is compelled to hold until the end of the season and another has sold early, returns and costs are averaged and the net to each is equalized. The cost of operation, brokerage, office expense, etc., has been reduced to minimum.

Mr. Stowe, also an officer of the Lima Bean Association, joined the manager in assurance to bean growers that the object of the association was to aid in marketing beans and if it was desired he felt sure the lima bean growers would be glad to unite in the marketing of other varieties.

He said the local associations had from five to nine directors, seven being the most common number. He felt that every producer should unite with others in organizing and stabilizing the market for every one of our products, simply as a war measure if not for selfish reasons.

One of the benefits of the association is the saving in the purchase of bags and twine. The association has united in ordering bags which were secured at nine and a half cents, and in buying twine which was purchased for 56 cents per pound. Today nearly everything is practically doubled in price. The saving on these two items alone to the growers has been between \$40,000 and \$50,000.

The association has already made sales of the coming crop at nine cents per pound. The average secured last year was only about five cents, but many obstacles were faced, the most serious one of which was the refusal of some members to abide by their contracts. The contracts have now been proved to hold in the courts and it is presumed the coming year will see the association entirely successful in its plan. It was deemed wise by the growers present that a permanent committee be appointed to organize bean growers in their sections. The committee appointed is made up entirely of San Fernando people.

We doubt not that if growers in other sections wish an organization the lines will be still further extended. The committee members are W. E. Beckstead, R. L. Owen, Wm. Kelly, N. W. Robertson, H. J. Whitley, Art Cravens, Alex Jeffrey, H. Carlson. This committee is to meet in the producing sections and consult with bean growers as to the advisability of completing the organization.

## Home Ground Limestone

**M**ANY farms which need lime are located so far from a commercial supply of ground limestone that the cost, after freight and hauling charges have been paid, is prohibitive. In many communities are found ledges of good limestone which would make excellent material. The small portable grinders now on the market make it possible for the farmers in such communities to grind their own limestone. These can be bought for \$500 to \$1500 and have a capacity of

from one to five tons per hour. A good sized machine for community work is one with a capacity of about two tons per hour, which will cost about \$750. A 16 horse power steam engine, or a 20 horse power gasoline engine will furnish sufficient power to do the grinding.

Quarrying is estimated to cost from 25 to 50 cents per ton, and grinding from 75 cents to \$1.25 per ton, making the final cost \$1.00 to \$1.75 per ton. A fair estimate of the separate items under favorable conditions according

## Fair Dates

Santa Rosa Fair, Santa Rosa, August 20-27.  
 Humboldt County Fair, Ferndale, August 22-25.  
 Yolo County, Woodland, August 29-September 1.  
 Dixon Fair, Dixon, August 27-September 2.

### OTHER STATES

Spokane Interstate Fair, Spokane, Washington, September 3-8.  
 Kings County Fair, Renton, Washington, September 14-16.  
 North Yakima Fair, North Yakima, Washington, September 17-22.  
 Pendleton Round-up, Pendleton, Oregon, September 20-22.  
 Idaho State Fair, Boise, Idaho, September 22-29.  
 Oregon State Fair, Salem, Oregon, September 24-29.  
 Montana Fair, Helena, Montana, September 24-29.  
 Arizona State Fair, Phoenix, November 12-17.  
 Pacific National Dairy Show, Portland, Oregon, November 12-17.  
 Pacific International Live Stock, Portland, Oregon, November 19-24.

to R. A. Kinnaird of the University of Missouri college of agriculture would be as follows: Engineer and 18 horse power engine per day, \$7.50; fuel about one ton coal, \$3.00; labor, three men at \$1.75, \$5.25; depreciation and repairs, \$3.00; cost of grinding 25 tons \$18.75; cost of grinding per ton, 75 cents; cost of quarrying, 50 cents; total cost per ton, \$1.25.

Ground limestone, fine enough to be satisfactory to use for sweetening soil, can rarely be delivered in car lot for less than \$1.25 per ton. On the average, therefore, there is not much difference between the cost of grinding at home and shipping it in. Distance from the railroad is probably the most important factor to be considered. If five miles or more from railroad it is probable that a crusher would be a profitable investment. The usefulness of a crusher is not confined to grinding limestone for the soil a most of them are constructed to crush coarse material for making concrete and building roads which they can do at much less cost per ton than grinding limestone fine enough for the soil. A portable crusher can be taken from farm to farm to do crushing of those farms where limestone can be quarried. This makes it possible for a man owning an outfit to do custom work, charging by the ton, which is generally the most satisfactory way for the work to be done.

# How About Your Machine Shed?

Farmers are fast stopping the "holes" in their pocketbooks. They are using modern methods, modern machinery and modern buildings. The home is comfortable and convenient, the barn is warm and large, the silo saves the feed, the granary holds the grain until the market is right, and the garage houses the automobile. Everything seems to be well taken care of. Then where is the "hole in the farmer's pocketbook?"

Farming in America is extensive rather than intensive. Extensive farming requires much farm machinery and the farmers of the United States spend \$200,000,000 for farm implements every year. Much of this vast sum goes to replace worn and discarded implements. In other words, the farmers are losing millions of dollars every year because they do not properly care for their machinery! The lack of a well built implement shed is the "hole in the farmer's pocketbook."

The farmer who leaves his expen-

sive implements under a tree or out in the open is truly "burning the candle at both ends." The importance of properly housing all farm machinery was never more apparent than just at this time. The cost of steel has advanced over 65 per cent during the last five years and consequently the cost of all machinery has risen by leaps and bounds. It is admitted that ordinary farm implements will last about five years if they are cared for, but with proper protection they are good for two or three times that long. The weather takes a terrible toll of waste and the farmer foots the bill. Besides, weather beaten, rust covered machinery is constantly in need of repair and needs much more power to operate it. Your machinery is bound to wear out in time, of course, but why not wear it out in service instead of letting it go to ruin for want of a little care and shelter? Wear cannot be avoided; rust and decay can. It is to the best interest of your pocketbook to build an implement shed.—Better Farming.

## The State Fair

Amongst the attractions at the state fair are:

Complete exhibits of dairy products, showing especially improved methods of handling.

The American Poland-China Record Association and the Standard Poland-China Association announce nominations for the 1917 futurities, totaling 25. Entries closed August 8.

Exhibits from representative schools in every section of the state, with special emphasis placed on food conservation, including home garden-

ing, dairying, cattle, sheep, poultry and swine raising. The prizes range from diplomas and medals to valuable cash and merchandise awards and scholarships at the university farm. Girls will have their share of attention in the food conservation movement through contests in bread-making, canning and other branches of cookery. Special prizes will be awarded to contestants demonstrating new or improved methods of utilizing the cheaper food staples, also prizes for best and most comprehensive menus which can be prepared at trifling cost.

## Farm Notes

Sweet clover is adapted to a wider range of climatic conditions than any of the true clovers, and possibly alfalfa.

Lime is a very important constituent of a productive soil, it acting not only as a plant food but as a soil tonic and corrective agent. It is the only thing that will sweeten a sour soil.

All the farm implements should be well housed and protected from rust. The loss to the farmer through neglecting to care for his machinery is greater than that sustained through wear.

A good many dairy investigators are now coming to the conclusion that more bacteria get into milk from poorly washed and uncared-for utensils than from all other sources put together.

Quite often in a new country it costs so much to improve the land and put it in condition for cultivation that land in a well-developed section is just as cheap, even at a higher purchase price per acre.

In ordinary farm practice, bulls are usually disposed of before their true value can be known. The cooperative bull association makes it possible to obtain several years' service from bulls that transmit desired qualities, and to eliminate all others.

Leguminous plants are of special value in feeding animals as well as for improving the fertility of the soil. The hay of leguminous crops is rich in protein and also carbohydrates,

hence is more economical for animals than hay made from non-legumes.

Good stable manure is one of the most satisfactory top-dressings for alfalfa. It should be applied in the late fall or early winter and distributed evenly. Where manure is not available, 300 to 400 pounds per acre of acid phosphate will nearly always give good results.

Lime is not a fertilizer, but a stimulant or an amendment. It has a very beneficial effect upon soil, as it neutralizes acids, causes the soil to flocculate and pulverize and become mellow. Clovers, alfalfa and other legumes require considerable lime for satisfactory growth.

It pays to plant good seed. Every farmer knows this even though he does not always take the time and trouble to secure the best. Too frequently the matter is given small thought and seed of a poor quality is accepted and planted with the result that there is a weak uneven stand and a very indifferent yield.

Encouraged by the experimental planting of sugar beets in Antelope Valley during 1916, the American Beet Sugar Company has placed a representative in the field and plans to materially increase the acreage this year. All of the land planted will be within a five-mile radius of Lancaster. Much interest is being displayed by the farmers, and success seems assured.

Educational moving picture films, illustrated posters and instruction sheets will be added as features to the

corn club work of the Ohio state university. In addition, visits by university representatives will be made to local club meetings of the boys. The clubs which are to be formed will consist of from eight to twelve boys who will meet regularly to study corn problems and talk over their experiences.

Remember the principle of breeding from selection. Like begets like, and this immutable law of nature is the foundation stone of successful agriculture. Whether you are growing a grain, root, vegetable, or fruit crop, or breeding horses, cattle sheep, swine, or poultry, the same principle holds good—breed from selection. Away with inferior seed and scrub sires. The continued use of them will prove your undoing.—Wm. Scott of British Columbia department of agriculture.

Cooperation among farmers is more difficult to effect than the consolida-

tion of capital in any other business enterprise. The farmer is the most individualistic of American citizens. It is not easy for him to transact his business with his neighbors. Independence in handling his affairs is a tradition that has been his business for generations. He prefers to conduct his business man to man as his fathers have done before him, unless necessity compels him to do otherwise.

Feeds are divided by the chemist, into three large divisions, known as protein, carbohydrates and fats. Protein, which is made up of about one-sixth nitrogen, produces casein in the milk, hair, skin, muscle and blood in the cow, and goes to nourish the foetal calf. Carbohydrates furnish heat to keep the cow warm and energy to keep up the functions which keep her alive. They also furnish the fat in the milk, and all extra carbohydrates are used in laying on fat. Fats perform the same function as carbohydrates except they are two and one-fourth times as strong.

### For Tractors and Trucks

With their indestructible MICA-insulation and protective jacket of brass—SOOTLESS PLUGS are outlasting every type of plug on tractors of every kind and size.

For 15 years—SOOTLESS PLUGS have given splendid service under the low-speed, heavy-duty conditions of tractor work.

Today—where extra-strength, power and cleanliness MUST be had—SOOTLESS PLUGS are always on the job.

**Try SOOTLESS when replacing your present plugs. Compare the service. Then judge their worth.**

*Sold by Dealers and Jobbers in most every city. If your Dealer can't supply you write us direct.*

**The Oakes & Dow Company**  
25 Chardon Street  
BOSTON, MASS.

### DEEP WELL TURBINES

No valves to pack or plunger rods to get out of order. For use in any well ten inches in diameter or over.

A complete line of irrigating pumps of all descriptions, horizontal and vertical for belt drive or direct connection to electric motor.

Prices as low as are consistent with good quality and workmanship.

## Who's Who

Written for California Cultivator By C. A. Briggs

With the issue of August 11 the Cultivator started its series of "Who's Who" articles to bring before its readers some of the livestock producers of California who are responsible for the large development of the industry. Where did they come from and how long have they been engaged in California development, also how do they look, so pencil and camera are to be used, and some homely, everyday photographs and notes regarding them will bring us closer together. Bear in mind we say "homely photographs" and not photographs of homely people. The idea we wish to convey is that so far as possible we will secure photographs in everyday surroundings at the homes of the livestock producers.

Other sketches and portraits will appear in the next and following weeks.

**W**HEN it comes to red hogs of the Duroc-Jersey kind he knows 'em. He's a good farmer, a good stock man and a good fellow. His fellow breeders speak well of him every time.

Good old Butler County, Nebraska,

Clayton N. Slocum

that state whose sole resources are soil, sunshine and good farmers, is the birthplace of the subject of this sketch, Clayton N. Slocum. In this

and Washington County he got his schooling and his early training as a farmer and stockman. After finishing his preparatory studies he went to the Nebraska state university where he specialized on his chosen lifework, agriculture and stock raising. During the summer vacation months he put in his time at work for some of the best stock breeders in Nebraska and Iowa, getting practical experience and training from masters of the business.

## Wormy Hogs

By L. A. Weaver, Missouri College of Agriculture

**H**OGS become infested with worms by picking up the eggs with the food or in the drinking water. Therefore to lessen the opportunities for the hogs to become infested they should be kept in clean, well-drained lots and should be supplied with fresh, clean drinking water and not allowed to drink from ponds and mud wallows. Fresh slacked lime sprinkled freely over the lots occasionally will help to destroy the worm eggs.

Hogs badly infested with worms should be given four grains calomel, six grains santolin for each 100-pound hog; or two and a half grains santolin, one drachm areca nut, two grains calomel, two drachms sodium bicarbonate for each 100-pound shoat.

These remedies should be fed in a thin slop. The slop should be made out of ship stuff or bran.

The hogs should be dieted for at least 24 hours, then given the slop containing the proper amount of medicine. Make sure that there is plenty of trough room so all hogs can get to the trough without crowding, so each hog will get his share of the slop. If necessary repeat in ten days or two weeks.

A good remedy for preventing worms is: three pounds glauber's salts, three pounds common salt, four pounds charcoal, one pound sulphur, three pounds copperas and three pounds sodium bicarbonate. Mix and keep in a self feeder or trough in a dry place where the hogs can have access to it at all times.

## House for Milch Goats

In California a good type of goat house is a simple shed inclosed on three sides and partly open towards the south, on which side wire fencing keeps the goats within bounds, and a canvas curtain is ready to be lowered in case of heavy wind or rain. Light and ventilation should be provided by windows and slides, so arranged that proper circulation can be had when required. Goats need plenty of fresh air, but must be guarded against wet and draughts.

It is best to have a small boxstall for each mature doe, as in this way there is little danger of pregnant does being injured by butting one another, and the does may also be fed more easily. Our goat house has boxstalls on the three inclosed sides, each stall measuring 4 feet by 5 feet and the partitions 4½ feet high. The stalls are made of 3-inch-wide slats spaced 2 inches apart for a distance of 3 feet from the ground and 3 inches apart the remaining height. It is necessary to space the slats close together to avoid the kids catching their heads between and being injured. The stalls should be 5 feet deep and the gate 4 feet wide. In each stall hung upon the wall is a feed rack, and in the rectangular space outside the stalls are large feed racks, each capable of feeding 12 does at a time, and having tie-ups so that each doe may be fastened to the rack to prevent her from fighting the others. We first feed the does at the

big rack and then they are put into their stalls for the night with the individual racks filled with hay. We grain the milking does on the milking stand and the others in their stalls. Young or dry does not pregnant are permitted to run in the inclosure with the big feed racks, from which they feed at will at night and during stormy days. This arrangement of box stalls partly surrounding a good sized open space is most convenient in handling a large herd of does. The bucks should be kept at a distance from the goat house on account of their strong odor.—Winthrop Howland in Angora Journal.

### COMBINING SHOWS AND SALES

By Frank D. Tomson

A feature that has contributed to the interest in pure bred cattle association sales is that of a show contest limited to the animals entered in the sale. This plan was originated by the American Shorthorn Breeders' Association and has been widely adopted in the various states and districts where Shorthorn breeders' associations put on sales.

Secretary Harding, acting for the American Shorthorn Society, has offered material encouragement to such shows by offering two trophies for the best bull and the best female in the show, and in addition cash prizes varying in amount with the extent and importance of the show and sale.

## JERSEYS AT AUCTION

The Jersey breeders of Stanislaus County, California, will sell at public auction, on a day yet to be named late in September.

### 70 REGISTERED FEMALES 16 REGISTERED BULLS!

There will be 12 Register of Merit cows, many daughters of Register of Merit dams, and the whole offering will contain a very large percentage of fresh or heavy springing cows and heifers.

All animals over six months tuberculin tested and sold subject to retest by purchaser.

## Breed Leaders

Every breed of live stock has its outstanding character the same as the human kind. A great dairy cow has proved her ability to produce anywhere up to 15 tons of milk annually; the trotting horse has secured his record around two minutes; the beefmaker has shown his ability to make the least amount of feed into the greatest amount of food; swine, sheep and others of the live stock family have shown themselves great characters. In addition—and here is where their worth is proven—these animals can transmit their productive power to their offspring.

Beginning with the issue of August 4 the Cultivator gave an account of Pietertje Bloom of the university farm dairy herd. Some things she has done and more that her daughters have done were chronicled. She was a most worthy leader in this series of articles. Others of her kind follow. More of the "handsome is as handsome does" type of animals will be given in the columns of the Cultivator during the next few months.

### PRINCE LAD 11TH

Written for California Cultivator  
By Gordon H. True

**T**HE subject of this sketch, Prince Lad 11th, is the Hereford herd bull at the university farm, Davis. He is a son of the famous show bull, Prime Lad 9th, 213963, by Prime Lad, 108911. Shown as a yearling at the International Livestock Exposition at Chicago before coming to California, this bull was placed third in a strong class of 14 in which Fairfax 16, later grand champion at this show, stood in sixth place. Both the sire and the grandsire named above were cham-

steers at the Panama-Pacific International Exposition in 1915. A cross bred son was reserve champion at Portland in 1915, and the now famous cross bred Hereford-Shorthorn calf, California Favorite, generally considered to have been the most popular grand champion steer in the history of the International Livestock Exposition at Chicago, was sired by Prince Lad 11th.

Few bulls with the limited opportunities of this one have sired so many outstandingly good ones. That the blood of the Prime Lads transmitted through the channel of this son and grandson carries on is indicated

Prince Lad 11th

A winner at the International at Chicago, at the P. P. I. E. and, better, a winner at producing great offspring.

pions in their day both at the American Royal at Kansas City and at the Chicago International. Prime Lad, shown six years in succession at the International shows, never stood below second place. The dam of Prince Lad 11th, Suzette 2d, 213976, was a show cow in the herd of W. S. Van Natta. In her veins the blood of the illustrious sires, Beau Donald, Lamp-lighter, Lead On, and Anxiety 4th, is comingled. In the herd of C. A. Tow, from whom Prince Lad 11th was brought, he sired three calves, one of which, Fairview Prince, was undefeated on the Western Fair Circuit until he reached the International where he stood second. He sold at auction for \$1225 as a calf. The other two, a heifer and a steer, got into third and fourth places respectively in strong competition at Chicago the same year.

In the university herd Prince Lad 11th has sired some outstanding individuals. Two sons out of the show cow, Bright Hope, have achieved high show-yard recognition. One was junior champion at Sacramento and at Portland as a calf, and the other was reserve champion at the Panama-Pacific as a yearling, and senior champion at Sacramento the year following, where he was defeated for grand championship by a younger son of the same sire, California Prime Lad 506858, that the university sold to go to the Hawaiian Islands.

Steers sired by this bull won all the class and group awards both for pure bred Herefords and for cross bred

by the fact that a son of Prince Lad 11th, Hopeful Prince 2d, 461454, is the sire of the calf that attracted so much attention at the recent Hereford Breeders' meeting at the university farm, and sold to be delivered at weaning time to J. A. Bunting, Centerville, for \$1000.

When in the future the history of Herefords in California shall have been written, Prince Lad 11th will stand out as one whose blood has contributed strongly to the upbuilding of the foundation of the breed.

### SWINE AT THE FAIR

A letter from Prof. J. I. Thompson, secretary of the California Swine Breeders' Association, calls attention to the need for all California swine breeders to make a bigger and better showing of hogs at the coming state fair. He refers to the advantage of publicity and of learning by exhibiting and advertising, adding: "Also please keep in mind that this association will probably hold a donation sale during the fair and it is sincerely hoped that each member will be able to contribute one individual."

### THE PROOF IS IN RECORD MADE

W. B. Weed, a subscriber of the Cultivator in Oklahoma, and one who has hopes of soon being again in California and having a paying dairy, refers to the necessity for having producers whether he has pedigrees or not. "I long ago found that only best bred record stock can be depended on for profits."

## Silo Prices Must Advance Sept. 1<sup>st</sup>.

By placing your order with us NOW for future delivery you can get the benefit of the present low prices and insure delivery when you need the silo.

### IDEAL GREEN FEED SILOS

Embody the Best There Is in Silo Construction

We Know What a Good Silo Should Be.  
20 Years Experience Has Taught Us How

Are you going to conserve your crops of Green Feed this year or are you going to depend on dry feed for another season of low milk production when butter fat is at a premium and prices high?

## El Dorado Holsteins

Headed by  
SEGIS PONTIAC DE KOL BURKE  
LUIT.

Out of a 32.76-pound 4-year-old. His  
sire is a son of Riverside Sadie De  
Kol Burke, 32.29 pounds butter in 7  
days.  
Herd officially tested for 7 and 30  
days.

**Alex Whaley, Tulare, Cal.**

## Field Notes from the Live Stock Men

C. S. Rasmussen, who has the only  
herd of registered Guernseys in Hum-  
boldt County, runs over 100 of fine  
grade Guernseys in addition to the  
pure breds. He has always used the  
best bulls obtainable and his remark-  
able yearly average of over 300  
pounds of butter to the cow, with  
over 100 head milked daily, shows the  
quality of his breeding. These cows  
get a light grain ration about five  
weeks during the winter, and the re-  
mainder of the year they get nothing  
but pasture. His stock is strong in  
the Glenwood blood and he is now  
using the son of Dupee's Itchen May  
King.

Jesse Bennet, Butte County Short-  
horn breeder, will not be able to show  
his cattle at the fair this year due to  
inability to secure a herdsman. Mr.  
Bennett has been selling service bulls  
to the rangemen for many years and  
has a broad trade established.

Ralph W. Bull of Eureka, and Ar-  
thur Hebron, Salinas cattlemen, to-  
gether with Dr. Keane, were appoint-  
ed to serve on the Cattle Protection  
Board August 1 by Gov. Stephens.  
The object of the board is to protect  
the cattle industry against theft, pro-  
vide for registration of cattle brands  
and licensing of dealers. The crea-  
tion of this board is an important step  
to the cattle industry which has long  
needed some recognition by the state.

W. H. Hammond's Cumberland type  
bull which Harry Murphy brought to  
California last year is in splendid  
shape and his owners are better  
pleased with him every day. He is a  
solid color, carries good flesh and is a  
show animal as well as a good indi-  
vidual. Sixty head of registered stock  
on this Butte County ranch places it  
among the largest in the state.

E. A. Noyes and Son, Butte County  
Hereford breeders, have one of the  
typiest foundation herds to be found in  
the West. Mr. Noyes, Senior, is an  
old cattleman who is an admirer of  
the White Face cattle as range rust-  
lers. The senior herd sire is New-  
man's Crest, bred by the Simon New-  
man Company, and he has gotten  
some fine calves. Lady Show U,  
462666, a two year old Anxiety bred  
heifer, is one of the best females in  
the herd. She is by a Lamplighter  
bull and won several prizes in the  
Eastern show yards before coming to  
the coast. There are a number of  
fine individuals in this herd, and it is  
to be regretted that Mr. Noyes will  
not be able to show at Sacramento  
this year because he could not secure  
a herdsman in time.

Bishop Brothers recently sold a  
bunch of registered Shropshire ewes  
to A. W. Foster and another lot to E.  
A. Noyes and Son.

Herbert Hoover, national food dicta-  
tor, in his first bulletin touching on  
the policy of the commission, stated  
that the matter of meat animals and  
products would receive attention im-  
mediately after the cereal question.  
Effort will be made to keep feed stuff  
prices at a level which will permit  
the profitable production of farm ani-  
mals. Speculators for private and ex-  
orbitant gain will be severely dealt  
with so that the stock men of this  
country will have every encourage-  
ment to increase output.

Chicago experts are predicting a 20  
cent hog market before next spring.  
If this proves true it means at least  
an 18 cent market on the Pacific  
Coast. Breeders who foolishly sell fe-  
males at this time just because they

see immediate profit should look  
ahead a little and see the unsatisfied  
demand which will surely rule after  
war requirements are filled. The  
world's breeding stock has been great-  
ly depleted and it will be years be-  
fore it will return to normal.

J. R. N. Boyd, Napa County, is just-  
ly proud of Lake Park Lady and Lake  
Park Longfellow, his two Yorkshire  
prize winners. The sow is from a  
litter of nine and was sired by the  
great boar, Bacon Frost, a grand  
champion in the East. The boar is  
also sired by Bacon Frost. Both ani-  
mals have enormous size, are about  
18 months of age, and are the highest  
type of breed excellence. Mr. Boyd  
has recently purchased a large fertile  
river bottom farm where he will pro-  
duce feed for Yorkshire hogs and beef  
cattle. His home is one of the show  
places on the Coast and in time his  
livestock will be heard from at the  
shows.

California stockmen will regret to  
hear that Prof. J. I. Thompson will  
exchange positions with a man from  
Kansas experiment station for a one  
year period, but will welcome the  
newcomer all the same. Prof.  
Thompson is one of the most popular  
college men who has yet honored our  
state institution in the capacity of in-  
structor in animal husbandry, particu-  
larly in swine. He was a keen judge,  
a fair one, and withal a successful  
one during his term of office. In ad-  
dition he took an active part in every  
movement which was for the better-  
ment of the livestock industry. At  
the time of his departure for the East  
some weeks ago he was secretary of  
the California Swine Breeders' Asso-  
ciation, and his place will be difficult  
to fill. The Cultivator together with  
his host of friends in California  
wishes him God-speed, and good luck.

Basset's 1916 champion senior year-  
ling boar, Surprise, will be exhibited  
again at the state fair, and from his  
appearance at this writing will be  
very hard to beat. He has size, plen-  
ty of bone, is as smooth as an apple,  
and carries the Basset stamp all over.  
Mr. Basset will have his usual high  
class show herd on the circuit.

San Joaquin Valley Farm Lands  
Company has just purchased two  
young boars from M. Basset to be  
used later on in their big herd in  
Fresno County. This concern has  
over 250 brood sows and is a market  
proposition exclusively. Los Angeles  
capital is heavily interested in the de-  
velopment of some 70,000 acres. A  
purebred herd of Hereford cattle im-  
ported from Texas will be used to pro-  
duce bulls for the large beef herd  
owned by the corporation. Possibly  
\$50,000 worth of pork will be turned  
off this year.

Wm. Bernstein, after missing one  
year on the show circuit, will be on  
hand again this year with his big type  
Poland-Chinas. The great sow,  
Candy Kid, will make the trip al-  
though her heavy duties on the Bern-  
stein ranch since the world's fair  
have interfered with her show ap-  
pearance to some extent. But the  
sow which beats her will have to  
travel because a matron like her is  
not produced very often in any herd.  
She has given Mr. Bernstein some  
wonderful pigs and is a striking ex-  
ample of the value of a single animal  
which combines show quality with  
utility performance. He will have a  
fine pen of two year old sows and in  
addition some classy young stuff and  
the herd boar, "The Great Westerner."

**Kill Disease Germs  
Purify the Air**

## Dr. Hess Dip and Disinfectant

**Means Animal Health**

Use about the barn, pens, chicken  
yards; use at the house on gar-  
bage cans, sinks, drains, cesspools.  
It cleanses and purifies—keeps  
down bad odors and smells and  
destroys disease germs. Dip your  
sheep to eradicate scab and kill  
ticks. Dip or spray hogs to kill  
lice.

**Sold on Money-Back Guarantee**  
Pint bottles, quart, half-gallon  
and gallon cans and barrels.

**Dr. Hess Fly Chaser** protects  
animals from flies. Does not gum,  
blister or discolor hair.

If not at your dealer's, address

**DR. HESS & CLARK, Ashland, O.**

## Your SILO

If properly filled with cor-  
rectly prepared ensilage, will  
pay you better than any  
other investment you can  
make for your stock, and  
save waste foods. Ensilage  
must be cut and conveyed  
at the least possible expense  
and the most economical and  
satisfactory results are ob-  
tained by the use of the

## CLIMAX SILAGE CUTTER

Cuts and Fills  
Silos as Fast as 8  
Teams Can Haul  
to Machine.

Ask any Climax  
owner about the  
durability and eco-  
nomy.

The finely tempered steel knives  
are bolted to the knife wheel and  
easily removed for grinding. The  
famous inward shear cut of the  
Climax saves power; while other  
wheel type machines waste power.

## Berkshire Hogs—Milking Shorthorns

Breeding Stock For Sale

**G. A. Murphy - Perkins, Cal.**

When writing advertisers, mention the Cultivator.

Sierra Vista Vineyard Company, Madera County Hereford breeders, now have one of the largest herds of registered cattle in the state. The Fairfax calf which was purchased from Warren McCray last year has developed into a wonderful young sire. He has exceptional bone, a straight top line, is well marked and colored, and is Fairfax all over. Breeding up from a foundation of ten cows in 1908, and using the best bulls obtainable has placed the Madera County herd on a high plane of ex-

cellence. Judging from the demand for bulls from cattlemen, which depletes the supply every year, the investment has paid handsomely.

A. A. Jenkins of Tulare reports the following sales of registered Jersey bulls recently: To J. T. Brown, Wasco; Mr. Clark, Tipton; L. E. Danley, Merced; Ned Thompson, Tulare. These are all fine animals; all are sons of Gertie's Lad and will do their share toward making better dairy cows in California. Also a young grandson of Gertie's Lad to Mrs. Cora Townsend, Bakersfield.

## Fitting Livestock for Exhibition

**M**ANY breeders of livestock are now vigorously preparing their animals for exhibition at the coming fall and mid-winter livestock shows. The following points on fitting are given by Wm. Hislop, animal husbandman of the Washington experiment station at Pullman. The first and most important step is to select the right kind of individuals. They must have desirable conformation, quality and breed type.

In all show animals the feet and legs must be well set under the body and perfectly straight. The bone must be strong, clean cut and the joints well defined. The shoulders should be smooth and well knitted, so as to leave no depression behind them which would indicate coarseness or lack of heart girth. The ribs should be long and well arched so as to insure width of back and depth of body. The loin must be broad and the flanks well let down, while the hind quarters should be strong, broad and well carried down to the hock. The skin and hair must indicate quality and be pliable to the touch, while the carriage must be graceful and easy. Feeding

In fitting show animals the object should be to present them before the judge in the highest possible bloom on the day of the show. In these times of high priced concentrates and roughness, one cannot afford to feed so heavily, and so bring them out in such high condition as formerly. One should attempt at the present moment to show breeding stock in breeding condition. Stock which is overloaded with fat is likely to be discriminated against by judges at the coming fall shows. Always use a variety in the rations. Variety stimulates the appetite and eliminates the monotony of the diet. The ration should be such, too, that it does not consume too much time in mastication, because the time saved in eating is time added to the rest, a most important consideration in fattening all livestock. The feed boxes must be kept scrupulously clean, especially in warm weather, otherwise they will sour. If any sluggishness or dullness of the appetite is noticed, the feed must be cut down at once and the individual brought back gradually to full feed. Irregularity and over-feeding are usually the causes of animals getting "off feed." In such cases a dose of linseed oil for horses and cattle, epsom salts for hogs, and castor oil for sheep is a most effective method of combating such trouble.

Some people cook the feed of show cattle. This is sometimes necessary and practical, but it seldom pays for any other class of livestock.

### Exercise and Fitting

Exercise is a most important factor in conditioning show stock. If not properly exercised, the animals get

stale, their appetites pall and they soon begin to fall off in flesh instead of thriving. Horses should be exercised regularly. Cattle should be turned out over night, and hogs should be exercised by being compelled to walk from a quarter to a half a mile daily. Sheep require exercise to make their flesh firm to the touch. Horses and cattle, too, should be thoroughly groomed, especially during the last two months of feeding. Sheepmen begin to trim the fleece for three or four months beforehand. Hog men usually begin to wash their animals about a month before show time. Show cattle are best not to be washed too often before show time, because their hide and hair get harsh. Likewise the legs of horses suffer (lose their freshness) by too frequent washing. The horns of beef cattle should always be polished when the animals are shown, so as to present a neat and attractive appearance. In the scraping and polishing of horns, care must be taken so as not to expose the core and thereby cause bleeding. The shell should never be scraped and polished until a red appearance shines through it. If the horn is too long, it should be shortened by cutting a piece off with a fine tooth saw. Then file the horns at the points to their natural shape. Later use a piece of emery paper and apply some oil. The hoofs should also be cleaned before entering the show ring. A piece of oily flannel is perhaps the best for that purpose.

In exhibiting livestock one should always aim to make an animal stand naturally. If the animal makes a good showing, it is due to its having been trained for months ahead of time at home. One must study the idiosyncracies of each animal. Some animals show better with their heads high. Some animals show better with their heads low. The best showmen are those who keep their eyes on their animals and on the judge at the same time. It is not well to try to deceive the judge by hiding some fault. As a rule when one hides one fault, one exposes two or three others.

### TOP NOTCH JERSEY SALE AT MODESTO

Leading breeders of Stanislaus County have consigned 75 head of choice registered Jerseys to be sold at public auction late in September, under management of California Breeders' Sales and Pedigree Company, Sacramento. The consignors are Guy H. Miller, Fred B. Wulff, W. M. Brady, and Riverina Farms, Modesto; Jno. O. Orr and W. J. Hackett, Ceres; and O. J. Ames, Oakdale.

The offering is an especially high class one, containing a large percentage of heavy springers and fresh cows and heifers, about a dozen excellent Register of Merit cows, a limited number of bred and unbred heifers and only about six bulls.

Col. Ben A. Rhoades of Los Angeles and Col. Cy N. Clark of Modesto will be the auctioneers.

## Elliott-Brant Rancho Guernseys Are Persistent Producers

The results of our first two years of official testing show our herd to average 10,172.28 Pounds of Milk and 507.97 Pounds of Fat. One half of these cows were heifers with first calf who averaged 8,670.24 Pounds of Milk and 436.01 Pounds of Fat (only 7 pounds under the average of all A.R. records). Our mature cows averaged 12,710.5 Pounds of Milk and 621.52 Pounds of Fat (120 pounds over the average of the mature cows of the breed). A bull from these cows will increase the production of almost any herd.

**Elliott-Brant Rancho, - Owensmouth, Cal.**

## ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY  
YOUR COWS MADE PROMPT, REGULAR BREEDERS BY  
**STERILOID**

**STOP LOSING CALVES**  
TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

**GUARANTEE:** We will refund money in every case when STERILOID FAILS to make good. Price \$1.00. Mail postpaid, in plain wrapper.

**MARTIN REMEDY CO.** Dept. L, 398-408 Columbus Ave., New York City.  
Reference, Colonial Bank

## MONTELENA HERD Large Yorkshires

Have large litters. Service boars of exceptional quality, in best breeding condition. They are strong, active, long, deep fellows, with big bone and splendid heart girth. Come and see them, or write to

**A. L. TUBBS CO.**  
Callistoga - California

Raising the Standard of California Bacon

## Poland Chinas, Medium Type

Choice breeding stock, both sexes, from Panama-Pacific International Exposition prize winning strain. 12 firsts, Junior Champion and Reserve Grand Champion Boar, Junior and Senior and Grand Champion Sows, \$2145 cash awards. Write to

**M. Bassett**  
Hanford, Kings County, Cal.

## KINGS COUNTY JACK RANCH

Breeders and dealers in American Jacks and Jennets.

Jacks and Jennets for sale at all times. Come and see them.

# Raising Chickens for Meat

Written for California Cultivator By Jean A. Koethen

**P**RODUCING the extra hundred million pounds of poultry meat the government has asked for in the next six months or so is going to require some planning right now by all kinds of poultry people. Too much cannot be left to the commercial poultryman. He has about all he can do to break even or a little better on his eggs, and besides he keeps White Leghorns, which means that he must market his surplus cockerels when they weigh a pound and a half each and his old hens when they are no longer profitable layers and weigh at the most four pounds each. To produce 150 pounds extra he would have to raise 200 extra chickens, for he cannot afford to sacrifice the pullets, and the old hens do not count.

This same 150 pounds of poultry meat can be produced by raising from 10 to 50 chickens of the right sort, that is, of the meat-type varieties, and in about the same time. Buff Orpingtons that have been bred for meat reach two pounds at nine or ten weeks of age—sometimes in less time than that—are excellent soft roasters at four months and by the time that they are six months old are as large and delicious a roast as the average family cares for. The same is true of the other varieties of Orpingtons. Some strains of Whites have been widely advertised as reaching

the two-pound size at eight weeks, and I have no doubt they do it, for I have seen some Buffs do the same thing.

The Light Brahma cockerel makes the finest of roasters, but is rather too slow a grower for frying. At five months old he should weigh from five to six pounds, which is about the weight of an Orpington the same age, but as he grows more slowly he is still a soft roaster when the Orpington is classed as a full-grown "rooster." A cross of White Rock cockerel on Light Brahma hens has been found particularly efficient in the production of large, rapidly growing roasters.

The American breeds, Rock, Wyandotte and Rhode Island Red, are usually classed together in regard to both egg and meat production, but they differ considerably. The Wyandotte is one of the most rapidly growing broilers and has a round, plump body with good breast. The Rocks, all colors of them, but especially the Barred variety, have always had a most enviable reputation as table birds. Being yellow-legged they are supposed to be more pleasing to the American eye and taste than the white or pink legged English Orpington, but it is difficult to understand why a portion of the bird which is not eaten should influence popularity. The Rhode Island Red has been a disappointment to me as a table bird. Cockerels reach frying size about a month later than do Orpington cockerels and lack the delicate flavor of the Orpington. But we are working now for quantity of meat and rapidity of growth rather than for flavor, so this difference need not count.

It is difficult to generalize as to comparative qualities of different breeds, for much depends upon breeding. In selecting stock for meat, look first to size, especially in the male, and next to rapidity of growth, as far as it can be ascertained. If your male bird is of standard size and weight, and a good blocky bird, you may expect good size and pretty rapid growth in his progeny. If he is undersized and scrawny do not look for anything worth while in the next generation. In buying a breeder it is usually difficult to learn just how fast he grew. You must take him for what he is now. When your own cockerels are growing, mark those which make the most rapid growth the first two months, and unless there is some setback later you will find they are the cockerels which are largest at matur-

ity. The use of a larger bird as father to your future broilers and roasters is a matter of vital importance in the production of poultry for meat.

The back lotter or farmer who is going to do his "bit" and raise a little extra meat should use the stock he has, if possible. If he knows from past experience that his cockerels will not reach two pounds before they are three months old, he will save feed, which is money this year, by purchasing a new male. If his stock is not of a meat or even of a dual purpose variety, he will probably do better to purchase a trio or a few settings of eggs of a breed that pleases him. Changing breeds is apt to be poor policy when one is after eggs, but if meat is desired it is well to remember that you cannot make a silk purse out of a sow's ear. Many birds of the beef-type breeds are fine layers, but one ought not to expect high egg production and a large amount of good, juicy meat from the same bird.

A good deal of what has been written in regard to extra meat production has assumed that the extra birds would be hatched in June or July. This may do in the East, but in California it is far better to end spring hatching in April or May, and then begin hatching market poultry in September. Set the hens or the incubators in August so that all or nearly all the chicks hatch in September. Poultrymen who have warm brooder houses can hatch right through the fall if they wish, but the farmer who must raise his chicks in an outdoor coop with a hen mother will be wise to get all his chicks out before the first of October. Even then a sudden cold spell in November may work mischief unless he has good shelter, but as a rule September hatched chicks

are so well along before rains or cold weather that they manage very well in a rain-tight coop or house.

For some reason the cold weather of November is harder on chicks than that of March, and everyone who hatches fall chicks should see to it that he has a comfortable house to which they may be hurried when the unexpected rain or cold norther comes. Here again the heavier, more thickly feathered breeds are at an advantage. One October, several years ago, a sudden bitter cold wind caught me with two large broods, one of Buttercups, the other Orpingtons, in small coops with open runs. Knowing how little Orpingtons mind these sudden changes I was slow about protecting the Buttercups. The result was that a large part of my Buttercups succumbed to the cold while the Orpingtons hardly noticed it.

Chicks of any good meat breed hatched in September will be ready for frying at Christmas or earlier. The better market for them is later—say about the first of February. The birds have then reached soft roaster size, weighing, according to breed and strain, from four to five pounds, and the market, which was glutted at Christmas, has reached its normal condition and is demanding roasters. Indications are that prices next February will be higher than we have ever known them. Anyone who is so forehanded and so patriotic as to have a nice bunch of roasters ready then may be sure of his reward. It is pleasant to feel that you are falling in line with the urgent request of the government and producing food for the hungry; pleasanter still to get your money back with a good profit. Let us speed up the fall hatching, see that our stock is of the right sort, and have our share of that hundred million pounds ready on time.

## The Best Feed on the Market

Has the highest protein at the lowest price, \$2.90 per 90-lb. bag, subject to market changes; see that your hens eat as much Dry Mash as they do grain; feed them lightly of grain in the morning and make them work for it; either have a scratching pen or spade up a part of the ground and rake the feed under; keep "A-1" Dry Mash in a dry form before them all day; about one hour before feeding them their grain in the evening WET their Mash and let them eat all they will; put it on top of the Dry Mash, then feed them all the grain they will eat; this stuffing process will give them a full crop to carry them through the long night of inactivity; analysis is printed on every bag; give it a trial. At Your Dealers or

The Globe Mills, Los Angeles

## How to Get Rid of Mites

Lice by day and mites by night furnish the unhappy condition of poultry kept under unsanitary surroundings. Treatments for lice are not effective for mites because the latter work only at night, making raids on the fowls from their hiding places in crevices of the roosts and cracks of the building. To destroy mites and keep the flock free of their depredations, insecticide sprays and a sanitary building are necessary.

The presence of mites is indicated by small black and white specks on the roosts—the excrement of these insects. The first step is to get rid of the hiding places so far as possible. The roosts should be taken down and all unnecessary boards and boxes removed. In heavily infested houses the mites are to be found in all parts of the building, including the roof. Where they are less numerous, the infestations usually are confined to the roosts and nests and the walls immediately adjacent. For small coops a hand atomizer will suffice for applying insecticides as sprays, but for larger houses a bucket pump, knapsack sprayer, or barrel pump is desirable. A rather coarse spray should be applied from all angles and thoroughly driven into the cracks. The floor also should be treated, as many mites fall to the floor when the roosts are being removed.

Of the several materials that have proved effective, one of the so-called wood preservers, consisting of certain coal tar products, known as anthracene oil, with zinc chlorid added, has given particularly good results. Its repelling power lasts for months. The

cost is about one dollar a gallon, but twice the quantity may be obtained by reducing with equal parts of kerosene.

Crude petroleum is almost as effective, retains its killing power for several weeks, and in most localities is very cheap. It will spray better if thinned with one part of kerosene to four parts of crude oil.

Both of these materials often contain foreign particles which should be strained out before spraying is begun. It has been found that one thorough application of either of these materials will completely eradicate the mites from an infested chicken house, but ordinarily it is advisable to make a second application a month after the first, and in some cases a third treatment is required. These subsequent applications may be made with a brush, using the materials pure and covering only the roosts, their supports, the walls adjoining, and the nests if they are infested. This method of application is effective for the first treatment also if the houses are not heavily infested. Poultry should be kept out of the treated buildings until the material is well dried into the wood.

Used as a dip, crude petroleum will also destroy the small mite which causes scaly leg. In dipping for this mite the solutions should not be allowed to reach the flesh above the infestation, or to get on the feathers.

## GENERAL MANAGEMENT

As soon as the cockerels are of broiler size those not intended to be kept as breeders the following year should be marketed. When the cockerels begin to annoy the pullets the sexes should be separated.

## Science Says Buttermilk

Is the only preventative for White Diarrhoea. It further states that many birds that are apparently in perfect health have the germs in their system and that these germs are transmittable from both male and female to their progeny. Reference Bulletin No. 162—issued by the Department of Agriculture, Berkeley, Calif. Write Berkeley for this bulletin.

Don't take any chances, use Globe "A-1" Buttermilk Mash. It prevents White Diarrhoea, it increases the appetite, it aids digestion, it produces more eggs for market and better eggs for hatching and it costs No More than other good mash.

It's the Lactic Acid in Buttermilk that does the good work. The dry buttermilk we use, chemically shows 10,000 Live Active Lactic Acid Bacilli to the cubic centimeter. Write us for Free Literature and sample of this wonderful feed. Not an ounce of filler used. Satisfaction guaranteed or money refunded.

GLOBE MILLS, Los Angeles

# LEGHORNS PRODUCE EGGS AT LESS COST

**L**EGHORNS produce eggs cheaper than hens of the general purpose breeds — Plymouth Rocks, Wyandottes, Rhode Island Reds, and Orpingtons. This fact, which confirms the belief and experience of commercial poultry farmers, was one of the results obtained in a rather extensive feeding test recently reported by poultrymen of the United States department of agriculture. Because they lay as many or more eggs, eat only about 55 pounds of feed per head as compared with 70 to 85 pounds eaten by the general purpose breeds, and because their egg yield very materially exceeds that of general purpose breeds during their second and third laying years, Leghorns, the specialists say, undoubtedly are more profitable to keep for the production of eggs only.

In this test the feed cost of a dozen eggs for one of the Leghorn pens was 7.34 cents in 1913 while the average cost of all the pens of the general purpose breeds was 10.6 cents. In 1914 the feed cost of a dozen eggs for the same pen of Leghorns was 8.7 cents as against an average cost of 15.1 cents for the second laying year of the general purpose pens. During their third laying year the cost of a dozen eggs was 8.8 cents compared to 18.6 cents for the general purpose fowls. The total value of eggs per hen over feed cost in the Leghorn pen for three years was \$6.84 against \$4.30 for the general purpose hens. The highest egg production obtained in any of the feeding experiments up to 1915 was by a pen of Leghorns which laid 157.6 eggs per hen, at a feed cost of 6.7 cents a dozen.

The Leghorns produce smaller eggs than the general purpose breeds. The average weight of the eggs of a pen of Leghorns during the first laying year was 1.42 pounds per dozen as against 1.53 to 1.58 pounds for the other pens. However, Leghorns laying eggs weighing 1.50 pounds per dozen or even more, the specialists say, have been selected and bred by many poultrymen. An examination in May, 1915, of 500 eggs from three Leghorn pens showed that 31 per cent weighed more than 2 ounces apiece, or 1.50 pounds to the dozen.

The value per dozen of the eggs produced by the Leghorns was from one to three cents less each year than the eggs of general purpose hens. This difference is due to the fact that the general purpose breeds are better winter layers than the Leghorns, while the latter give a higher production in the spring and summer. Very few Leghorns become broody, which probably materially affects their egg yield as compared with the general purpose breeds. Better fertility in the eggs, especially with stock confined to the yards, is more often secured with Leghorns than with the general purpose or any of the heavier breeds.

## CALIFORNIA LAND SHOW

Announcements are out for the California Land Show which will be given under the auspices of the San Francisco Real Estate Board. The show will be held at Eighth and Market Streets, October 13-28. The promoters announce that the show will be largely an effort to advance the "back-to-the-soil" movement.

It never pays to be so insistent for your "rights" that you rob yourself of your privileges.

# Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 31,000 readers, weekly.  
Liner rates: Single insertions 3c per word;  
yearly contracts 2½¢ per word. 35c per issue minimum charge.

## TREES

Here is Your Opportunity to Secure All citrus trees. We offer several thousand 2-year-old lemons; Eureka and Villa Franca, also Washington navel; also several hundred Valencia on sweet root. We call these good trees and we know whereof we speak. **ALBERT JACKSON, Upland, Cal.**

By Far the Lowest Priced means of reaching a buyer for what you have to sell is through classified advertisements in California Cultivator. The cost is only 3 cents per word per issue, with a minimum of 35 cents.

Four Thousand Eureka Lemons, six thousand Valencia, five hundred seedless Grapefruit, two years old; good stock. For sale or trade. What have you? **Smith & Lane, Glendora, Cal.**

For Sale—15,000 sour orange seedlings. One year, 8 to 20 inches. Nothing better. \$25.00 f. o. b. **Randall Bros. Nursery Co., Whittier, Calif.**

Citrus Trees—All kinds, any quantity. Butler's Morning Side Nursery, Laramanda Park, Cal.

Sour Orange Seedlings.—About 10,000 fine plants about 2½ years old. Ready now for immediate planting; \$20 per thousand, fine root. **McMillan Citrus Nurseries, Puente, Cal.**

Avocado Seedlings in flats \$14.00 hundred. **Geo. Michels, R. No. 2, Box 462, Pasadena.**

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

## WANTED

Wanted—Man in each California county to represent established California company. Should have rig or auto to get around. Good pay and several weeks' work to right parties. Address **J. H. Yetter, Sales Department, 810 Santa Marina Building, 112 Market St. San Francisco, Cal.**

Wanted—Position as dairy foreman or herdsman by experienced man. Understand compounding rations and productive feeding. Will get results for employer through modern efficient methods. **Box O, Cultivator.**

Position Wanted as first class American or California cheese maker and factory manager. Best references. **E., Cultivator.**

We Buy Weed Seeds—Mustard, rape, anise, bitter clover, etc. Send samples. Write us, stating quantity and price. **Globe Mills, Los Angeles.**

One of the Most perplexing problems to farmers and ranchers is that of help. A small liner ad in California Cultivator is the quickest and easiest means of securing farm help.

Wanted to hear from owner of farm or unimproved land for sale. **O. K. Hawley, Baldwin, Wisconsin.**

Wanted—Experienced operator for Sharples milking machine. **C. H. Stiles, McFarland, Calif.**

## FARM LANDS FOR SALE

For Sale—Come to Kern County, buy a ranch near Bakersfield, the county seat, the coming city of the San Joaquin Valley, an up-to-date city of 20,000 population. Take this little five-acre ranch, near paved road, 1¼ miles from city limits, five-room house, stable, chicken house, a few fruit trees, grapes, garden, alfalfa. Water right in ditch for irrigating. Good well, horse and tools to work the place goes in for only \$2500. For this, and other Kern County bargains, write **R. A. MOORE & SON, Hopkins Bldg., Bakersfield, Cal.**

For Sale—Fruit ranch 21A Santa Clara Valley. 16a. prunes, 3a. apricots. Trees 13 years old very thrifty. Excellent soil. Good irrigation and pumping plant. House and buildings. Complete fruit drying equipment. Farm machinery and horses. Owner **John Silbersack, San Martin.**

Oregon, California Government Lands. Latest Green Booklet Free. Tells "How, Why, Where." Write **Joseph Clark, Sacramento.**

## POULTRY

Day Old Chix—Barred Rocks, Rhode Island Reds, Black Minorcas, Brown Leghorns, Buff and White Orpingtons. Other popular breeds a matter of correspondence. **Enoch Crews, Seabright, Calif.**

Poultry Wanted — We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We commit immediately. **National Poultry Co., 607 E. Third St., Los Angeles, Cal.**

Half Price Sale Pullets, Cockerels, Hens, 200-250 egg Leghorns, Wyandottes, Rocks, Reds, Orpingtons, Anconas, Minorcas. \$3-\$10 profit per hen this year. **C. Beeson, Pasadena, Calif.**

"Eastman's Bred-to-Lay" Barred Plymouth Rocks, August chicks and eggs. **Fairmead Poultry Farm, Fairmead, Cal.**

## AGRICULTURAL IMPLEMENTS

Large Assortment slightly used and agents' sample plows, barrows, cultivators, wagons. Call and see them before buying. Save 50 per cent on some. Four floors. Largest stock. **Arnott & Company, Ranchers' Supply House, 112 to 118 South Los Angeles St., Los Angeles.**

Bean Threshers Attention—The best and cheapest source of power for small threshing outfit is a Little Bull Tractor. Will haul your outfit anywhere and give ample power at the belt at very low cost. Several of these tractors have been used for this purpose two seasons with great success. Terms if desired. Low prices. See **P. J. Weisel & Co., Anaheim, Cal.**

## HOGS

Chester Whites, the Billiken Brand.—Your duty is to raise more hogs and increase the meat supply. The demand for pork exceeds the production. Get started with some of these Chesters: 3 bred sows farrowed in April, 1916, due to farrow in September, and October; 18 October gilts bred to farrow in October; 3 October boars ready for service. All first class in every respect and good enough to fit and show at the different fairs this fall. All are cholera immune and will be registered free. Write for price list and booklet. **C. B. Cunningham, Box C, Mills, California.**

Grape-Wild Farm Berkshires — World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. **A. B. Humphrey, Escalon, San Joaquin Co., Cal.**

Large Yorkshires — Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. **Riverina Farms, Paradise Road, Modesto, Cal.**

Superba, World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. **Rough's Greenfields, Arlington Sta., Riverside, Cal.**

Wanted—Farmers, orchardists, livestockmen to use classified liner advertisements like this. Thousands of people read every ad and the cost is only 3 cents per word per issue, minimum 35 cents. Extra lines of white space above and below cost only 16 cents per line.

Rancho Rubio Durocs.—Nothing to sell at present. A fine bunch of gilts and a few extra good service boars for this fall. **Elmer Lamb, Ceres, Cal.**

Big Type Durocs. Well grown out February and March pigs of either sex in any quantity. We ship only the tops and butcher the culls. **F. M. Johnson, Napa, Cal.**

Cholera Immune Duroc-Jerseys. Big type. Weaned boars and gilts from 500 to 700-pound sows. Price winning stock. **Derryfield Farm, I.O.O.F. Temple, Sacramento.**

Duroc-Jerseys—For extreme size, perfect feet, legs and backs, try the GOLDEN MODELS. **Peters, Lamson & Walker, Devore, San Bernardino County.**

Choice Boar Pigs for Sale — Sired by Superba 220620, champion Poland boar at San Francisco. Prices right. **C. R. Hanna, Riverside, Cal.**

Poland-China Swine Recorded. Stock for sale at all times. We please you or refund your money. **W. A. Young, Lodi, Cal.**

Most Money in Duroc-Jerseys. Bred sows and weanlings, either sex all the time. **Delta Farm and Live Stock Co., Colton, Cal.**

One Large and two medium type boars extra choice, 9 and 10 months old. **W. Bernstein Ranch, L. C. Trewhitt, Mgr., Hanford, Cal.**

Large Yorkshires—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. **A. L. Tubbs Co., Calistoga, Cal.**

Duroc-Jerseys—Few choice March males from best eastern stock. Reasonable prices. **W. M. Taylor, R. D. No. 1, San Bernardino.**

Large Type Poland Chinas are prolific and profitable. Can furnish boars any age at reasonable price. **J. A. Crawshaw, Hanford, Calif.**

Model Herd Berkshires bred for size and quality. Weanlings and gilts. **J. L. Gish, Laws, Calif.**

Carruthers' Farm Berkshire Hogs. Our herd won Premier Exhibitor prize at the P. P. I. E. Exposition, Mayfield, Cal.

Poland-Chinas — A few good breeding boars. **S. F. Williams, Orland, Cal.**

## MISCELLANEOUS

To Fruit Growers—New simple process for crystallizing figs and all other fruits. Instructions, terms, on application. Correspondence with fruit growers solicited. **Monteith & Co., Santa Rosa, California.**

Slacked Lime—Send for sample and information. Price right. Let me help you. **H. B. Matthews, 350 Woodberry Road Pasadena.**

Bird Alarms Protect Everything from birds, rabbits, rats, etc. Neat, durable, effective. Six for 50 cents. **California Sales Co., Watsonville, Cal.**

To Reduce the high cost of living, send for our Wholesale to Consumer Catalogue. **Smith's Cash Store, 112 Clay St., San Francisco.**

## PATENT ATTORNEYS

Patents that protect are secured through The PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "PATENTS."

## LUMBER

Lumber—Sash — Doors — Plumbing Supplies—Building Materials of all kinds, new and 2nd hand. \*A.R.W. Shingles 50c per bundle. Send list for estimate. **Dan P. Dolan, 1670 Mission Street, San Francisco, Cal.**

## LIVE STOCK

Butte City Shorthorns, Shropshires, Berkshires and Ponies. Stock of all ages for sale. Can supply one or a carload. Get our prices and descriptions before buying. **Butte City Ranch, Box C, Butte City, Glenn Co., Cal.**

At Last the Perfect Silo—the Stay Round. No hoops, no bolts. No experiments. Any one can erect. Close price. Address **D. O. Lively, 215 Hobart Bldg., San Francisco.**

## CATTLE

D. O. Lively Stock Farm, Inc., 215 Hobart Bldg., San Francisco. Breeders of Hereford cattle. A few choice heifers for sale. We buy and sell live stock on commission. **Farm at Mayfield, Cal.**

Registered Holsteins out of ARO Dams. Grandsons of Pieterje Maid Ormsby, 35.55 pounds average 5.31. **Geo. Kounias, Modesto Farms, Modesto, Cal.**

Venadera Jerseys, the herd with official yearly records. Calves of both sexes for sale. **Guy H. Miller, Route 1, Modesto, Cal.**

Veramont Stock Farm Pure Bred Herefords. Location Plumas County. Ideal for stamina and vigor. Bulls for sale. Address **H. M. Barngrover, San Jose, Cal.**

Thirty high-grade Holstein Cows and one registered Holstein bull. **Chas. Hubbard, Riverdale, Calif.**

Young Holstein Bulls, bred right, grown right, priced right. Creamcup Herd. **M. Holdridge, Modesto, Calif.**

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale

Holstein Bulls from record cows. Prices right. **A. M. Bibens, Modesto, Calif.**

## MACHINERY

WHY BUY NEW? SAVE HALF Material guaranteed. It's second hand after used few times, but not worn out. Few engine snaps new 1½ h. Olds, cost \$75, for \$39; 6 Stearns, \$89; 8 Stover, \$150; 12 Fairbanks, \$165.

NEW, USED WOOD, GALV. TANKS All sizes, used heavy 1500 gal. galv. with metal covers, cost new \$75, for \$38; 10,000 redwood, \$75. Fine, heavy 10,000 galvanized, \$135, 16,000 corrugated galv., \$250. Galv. 4x4x4 tank, \$15. SWELL-EST, LARGEST tank in city, 100,000 gal. 3-inch redwood with round lug hoops, cost \$1200, our price \$400. Why build cement reservoir when you can get one like this, use it 10 years, then sell it for as much as it cost you?

WINDMILLS, SPECIALLY PRICED 8, 10, 12, 16-ft. sizes. Pumps as much water as new ones, a half price; costs nothing for fuel. 12-ft. aeromotor and swell steel tower, \$88.

PUMPS, CYLINDERS, PIPE 2½-in. two-runner hor. centrifugal pump, \$50; 2-in. rotary, \$2250; 5-in. two-stage Byron Jackson hor. cent. pump, \$150; 3-in. hor. cent. \$150, pumps 200 in. water. 7 vert. cent. Krough, deep well double-acting. Addison 24-inch stroke pump, good for 50 inches, complete with 35 ft. 10-in. casing, double acting rods and 9-in. brass double-acting cylinder, all for \$475; cylinder alone worth the money. Large Bulldozer jacks, \$68. Plunger pumps, \$2 up. 5x6 air compressor, \$29. 90 ft. 7-in. irrigating pipe, 32c. All kinds brass pump cylinder, rods, big pipe fittings of every description.

RANCH MACHINERY Walking plows, \$2.75 up; spike harrows and cultivators, \$2.50 up; 4 and 5-ft. Fresno, \$9 to \$12; wheel barrows, \$2.50 up; 350 ft. ¼-in. cable, 6c; water troughs, \$4; bone grinder, \$6.50; feed mill; sprayer; mowers, rakes, buck rake, \$20; belting, all sizes; sundries too numerous to advertise. Material guaranteed as represented or money refunded. Down town office **DEMMITT CO., UP-STAIRS 120 N. Main. Yards, 816 Yale, Los Angeles. Phones 15191; Bdwy. 1984.**

Gasoline Engines, the largest stock of used gas engines in California from 2 h. p. to 100. Thoroughly overhauled. Machinery Exchange, 733 North Spring St., Los Angeles.

Several new and slightly used engines at a bargain. Best makes, 1 to 35 h.p. **Arnott & Company, Wholesale Machinery and Implements, 112 South Los Angeles St., Los Angeles, Cal.**

For Sale—New Model J 10-20, 28 h. p. Sandusky Tractor used only three weeks, bargain. Write Machinery Exchange, 733 North Spring St., Los Angeles.

## SEEDS AND PLANTS

\*\* ORDER YOUR SEEDS NOW \*\* If you are going to need any seeds for next season now is the time to render your orders. It may be impossible for you to buy what you need later. **V. A. Peterson Alfalfa Seed Co., Arbutuck, Cal.**

\*\* ALFALFA SEED OUR SPECIALTY \*\* Seed Potatoes—A limited supply of Burbank, American Wonder and British Queen for August planting. **H. A. Hyde, Watsonville.**

New Crop Alfalfa Seed now ready. Not the lowest in price, but high in quality. **Leo Turner, Yuma, Arizona.**

## RABBITS

Raise Rabbits For Us—We sell you foundation stock and buy back what you raise, paying \$1.75 and \$2.00 each for them. Send 25c for our proposition, our book on rabbit culture and our supply catalog. **Gilmore's Rabbit Farm, Dept. C, Santa Barbara, Cal. (The rabbit farm of international reputation.)**

## HORTICULTURAL PRINTING

Catalogues — Good Printing. Specialists in preparing nursery, seed, poultry and live stock catalogues and all kinds of commercial printing. For prices and information address **WOLFER PRINTING Co., 424 Wall St., Los Angeles.**

## QUITE LUCKY

Mistress — They say there are 10,000,000 germs on the cap of a milk bottle.

Maid—Sure, ain't it lucky it don't wear a coat and pants?—Town Topics.

## The Cultivator Patterns

8046—Ladies' Dressing Sacque. Cut in sizes 36 to 42 inches bust measure. Any of the pretty crepe materials can be used for this sacque.

8449—Girls' Dress. Cut in sizes 6 to 14 years. The dress has a one-piece, straight gathered skirt.

7816—Ladies' Dress. Cut in sizes 34 to 44 inches bust measure. The dress has a plain waist and a seven-gored skirt.

7919—Ladies' Shirt-Waist. Cut in sizes 34 to 42 inches bust measure. Linen, or crepe de Chine can be used for this waist.

7686—Girls' Dress. Cut in sizes 6 to 12 years. The dress has a separate guimpe.

8476—Ladies' Apron. Cut in sizes 36, 40 and 44 inches bust measure. The apron is to be slipped on over the head.

8448—Ladies' Skirt. Cut in sizes 24 to 30 inches waist measure. The skirt is cut in two pieces.

Price of each of the above patterns ten cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

### HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

### THIS, TOO, SHALL PASS AWAY

A mighty monarch in the days of old  
Made offer of high honor, wealth and gold

To one who should produce in form  
concise  
A motto for his guidance, terse and wise—

A precept, soothing in his hours forlorn,  
Yet one that in his prosperous days  
would warn.

Many the maxims sent the king men say,  
The one he chose: This, too, shall  
pass away."

Oh, jewel sentence from the mine of truth,  
What riches it contains for age and youth;

No stately epic, measured and sublime,  
So comforts or so counsels for all time,

As these few words. Go write them  
on your heart,  
And make them of your daily life a part.

Has some misfortune fallen to your lot?  
"This, too, shall pass away." Absorb  
the thought,

And wait; your waiting will not be in vain;  
Time gilds with gold the iron links  
of pain.

The dark today leads into light to-morrow;  
There is no endless joy nor endless sorrow.

Are you upon earth's heights? No cloud in view?  
Go read your motto once again: "This  
too, .

Shall pass away;" fame, glory, place,  
and power—  
They are but little baubles of the hour,

Flung by the ruthless years down in the dust.  
Take warning, and be worthy of God's trust.

Use well your prowess while it lasts;  
leave bloom,  
Not blight, to mark your footsteps to the tomb.

The truest greatness lies in being kind,  
The truest wisdom is a happy mind.

He who desponds his Maker's judgment mocks;  
The gloomy Christian is a paradox.

Only the sunny soul respects its God,  
Since life is short we need to make  
it broad;

Since life is brief, we need to make  
it bright,  
Then keep the old king's motto well  
in sight,

And let its meaning permeate each day,  
Whatever comes, "This, too, shall  
pass away."

—Ella Wheeler Wilcox in Examiner.

### WHAT IT IS THAT WINS

A countrywoman remarked to her neighbor during a conversation on their return from market, "How is it, Mary, that you have been married four times and I've never been married at all and I'm much handsomer than you?"

"Aye, to be sure," returned Mary, "but it ain't handsomeness that does it, Sarah. It's the 'come hither' in your eye."

Now that new potatoes are in try washing them clean and steaming until tender, instead of the old tedious method of scraping. The skins will peel off easily and they may then be creamed or used as desired.

### ENROUTE TO A MAN'S HEART

Written for California Cultivator  
By Mrs. A. Stainton

THE ordinary country market is the despair of most housekeepers and during the hot weather they frequently become embarrassed over the

arrangement of seasonable dishes, yet it is quite possible to use even the few and poor meats and other produce in such ways that their lack of tenderness and variety is not discoverable.

"It really is too hot to eat!" is a frequent remark one hears, but when we sit down at a midday meal served in a shady dining room and see dainty cold food our appetite revives and we find after all we are hungry.

A suggestion for a hot day's luncheon is jellied chicken bouillon, lamb mousse and strawberry jelly salad.

The jellied bouillon is simply a good chicken bouillon clarified, and enough gelatine added to make it a quivery shaky jelly. Serve in cups.

Lamb mousse is cold meat cookery and one way of utilizing "left overs." Put cold roast lamb twice through the meat chopper till you have two cups, add seasoning to taste; dissolve a teaspoon gelatine in a cup of strong meat stock, mix well with the lamb and let it get cold, beat in slowly half a cup of whipped cream, put into a mold and let it get very firm before slicing. Serve in slices arranged overlapping each other on a chilled platter inside a border of crisp lettuce or watercress. Just before serving put French dressing on the lettuce. Cut some good sized lemons in halves, scoop out the inside, cut a slice from the bottom till they stand easily and fill with peas topped with aspic mayonnaise. Place the filled lemon halves around the outer edge of meat platter and between slices of lemon place a tiny mold of mint jelly.

Mint jelly is easily made by preparing the usual lemon jelly, omitting the sugar and adding while it is warm a bunch of bruised mint, then putting in the gelatine, straining it and setting in egg cups. When cold these sparkling green shapes look attractive and taste good. The aspic mayonnaise is thick mayonnaise with a little aspic gelatine added to enable you to handle it easily when forcing it through the tube for decorations.

The strawberry jelly salad is made with orange jelly, using orange juice entirely instead of the usual percentage of water. The mold is lined with the orange jelly and filled with strawberry cream. Serve in flat dish, cut glass is prettiest, and around the outer circle of the jelly place tiny balls of cream cheese rolled in chopped nuts and placed inside hearts of lettuce.

It was gelatine of course, that made such an appetizing luncheon so easily and quickly prepared. The foods can be prepared in the cool hours of morning or evening when most convenient and taste all the better when one is not overheated cooking a hot meal at noon, and the use of jellies makes it also possible to make a most attractive meal out of almost nothing from materials at hand.

I buy this commercial gelatin by the dozen packages. It is put up in small packages, each package sufficient for two quarts of jelly, and always have a supply on hand. There is some difference in size of packages, due to different methods of packing by different firms. Granulated gelatin occupies a smaller space than shredded gelatin; it also dissolves quickly.

It is clarified before packing which removes the necessity of a second clarifying unless the materials used for flavoring cloud the mixture. Then it is necessary to clarify it to have the jelly brilliant and sparkling. Gelatin must be soaked with a small amount of cold water before adding the flavoring and boiling water. I strain it through two thicknesses of cheese cloth. Sometimes the pulp of lemon or orange will make the mixture decidedly cloudy and I clarify it by adding to the mixture after the gelatin has been dissolved, flavored and sweetened, the beaten whites and shells of two eggs. I beat the whole for a moment and stand the saucepan over the fire, bring to boiling point, boil rapidly a couple of minutes, then slowly a few minutes longer. I place a piece of cheesecloth, folded to have two thicknesses, in a sieve and gradually pour the jelly through. If not clear enough I strain a second time, allowing it to drip very slowly and being very careful not to jar or press the bag. When ready to mold I dip the molds in cold water, shake them and turn in the jelly. Stand aside where they will cool quickly. When ready to serve I loosen the edge of the gelatin from the mold with a knife, dip it in hot water a fraction of a second, lift, turn sidewise until I can see to the very bottom of the mold. Then place the lower edge of the mold in the proper position of serving dish, turn it over and lift carefully from the jelly.

A cover of gelatin improves the appearance of cream desserts and is easily managed by using two molds of the same shape, one smaller than the other. Put a layer of liquid gelatin in the bottom of larger mold, pack in ice to harden quickly. When hard dip the smaller mold in cold water and stand it on top and in middle of gelatin in larger mold and fill space between two molds with cold liquid gelatin. Fill inner mold with cracked ice and allow jelly to harden. When ready to fill, remove small mold and fill space with the cream. Any combination may be used. Dark jellies like prunes look better with cream.

I have used tumblers when I wanted something smaller for a church sale or tea, but it gave me more trouble than molds, the glass being more difficult to remove. I have also molded flowers and fruits in the jelly to give added finish to the appearance. This makes a sale doubly sure but does not in any way contribute to flavor of jelly.

Southern California Music Co.  
332-34 So. Broadway - Los Angeles

**Raspberry Jujubes** are made by soaking four ounces gelatin in a cup cold water. Boil one-fourth pound sugar one pound raspberry jam and half a pint water together for five minutes, rub through a fine strainer, add the gelatin, bring the syrup slowly to the boil, add a little flavoring if desired and a few drops of carmine to make deeper pink; let it cool a little and then pour into square mould which has been rinsed in cold water, and cut the jujubes into squares just before the mixture is set. Other fruits can be used instead of raspberries. Turkish paste is made by soaking three level tablespoons granulated gelatin in three-quarters cup cold water. Dissolve two cups granulated sugar in two-thirds cup orange juice and two tablespoons of lemon juice. Add thin yellow rind of two oranges to the two mixtures and bring to a boil, then let boil 20 minutes. Turn into un buttered bread pan to cool. To unmold, loosen the paste at the edges, sift confectioner's sugar over the paste and the tips of the fingers and pull from the tin onto a board dredged with confectioner's sugar. Cut into cubes and roll in sugar.

**Rhubarb jelly** made with pink gelatin and served with strawberries around it makes a pretty dessert.

**Prune and fig jelly** is worth a trial. Cook soft some prunes and take out the stones without breaking the fruit. Add half the quantity of cooked figs or dates. Put fruit into a mold and pour over barely enough warm lemon jelly to cover. Set aside to chill and serve with cocoanut cream.

#### Jellied Fish

Boil any kind of fish in barely enough water to cover it, add a tablespoon vinegar, two bay leaves, two cloves, pepper and salt. When fish is sufficiently cooked, take it up and divide into small pieces. Boil down the stock to a cup, pour it over a level tablespoon of gelatine, dissolve and strain. Put fish into fish shaped mold, pour over the jelly (stock) and chill. Serve with cucumber salad. White fish of any sort mixed with plain unsweetened lemon jelly molded in fish shaped mold and served with mayonnaise or salmon can be used and then a cold cream sauce is delicious. This is another way of utilizing left overs and robbing the garbage pail.

**Tongue** is one of the things that cannot be spoiled by country markets and the left overs offer makings for a salad. Cut into dice, sprinkle with lemon juice and pepper, mix with chopped celery and mayonnaise, garnish with heavy rope of tomato aspic and halves of hard boiled eggs with bits of parsley.

**Jellied Spaghetti** is cooked in salted water till tender. While warm twine around tube of mold (cake tin will do), put a little on sides of mold, but none on the bottom, and fill center with squab jelly, or rabbit meat may be used. Serve whole garnished with sliced white of egg and yolk pressed through a sieve.

Gelatin dishes are capable of great diversity and can be plain and simple or served with many frills and ruffles. They may include whole chicken, turkey or young pig to veal, ham pie, salads, plain and fancy, creams and desserts. Even a little added to ice cream or sherbet is a vast help if wanted quickly or for an Alaskan bake. If the children look askance at cereal try a lemon or orange jelly thickened with grape nuts, puffed wheat or puffed rice.

Oatmeal does not require gelatin to make it jelly, but cold oatmeal served

with blackberries is good. Peaches are delicious, but try a small cup of the jellied oatmeal with ripe red raspberries with powdered sugar and thick cream. It is nutritious and makes a dish for an epicure. Stoned dates or chopped figs stirred in two or three minutes before serving are also an immense improvement.

#### HELPS IN THE KITCHEN

Written for California Cultivator  
By Martha

**T**O make good baking powder at home, take six ounces of soda and eight ounces of cream of tartar. Place on a tin dish in the oven for a short time for it to dry out thoroughly, but there must not be enough heat for it to brown, and when dry sift through a fine sieve three or four times. Put in a tin can, keep closely covered and follow directions for ordinary baking powder. When making a cake, stir the baking powder into the milk and beat until it foams, and the cake will be lighter and of finer grain.

A very little soda put in stewed cranberries, rhubarb or gooseberries before the sugar is added will counteract the acid so that it will take less sugar to sweeten, and a bit of soda cooked with green vegetables will make them more tender and keep them a fresh color, and they will cook much more quickly.

Instead of laboriously scraping carrots wash them clean and boil with skins on. Then they can be skinned by letting cold water run into the pot until you can slip the skins off by hand. Young and tender carrots are delicious with a cream sauce, and they are also among the most wholesome of vegetables.

The dish towels last twice as long if they are never allowed to become dingy before washing. They may be kept white and clean as long as they last by rubbing out after each meal in a little warm suds with a bit of soda added and then boiling twice a week in borax soap chip suds.

I find it a great help to keep a soap solution ready for use. This is prepared by dissolving a handful of the soap chips in a little boiling water. This is stirred until well mixed and then kept in a closely covered pint glass fruit jar. A very little of this solution stirred in hot water makes a strong lather, and there is nothing better than this suds for cleaning out the refrigerator, then rinsing with hot and then with cold water. Glass and china dishes come out shiningly clean by washing through this suds and then rinsing through hot water.

When baking cookies, pin clean white muslin on bread board and rolling pin, stretching it tight and flouring well and you can roll dough soft and thin. If you haven't a good molding board get some large piece of heavy brown wrapping paper with a gloss finish and you can use one piece a long time by scraping off after each using, and when this begins to wear, you can throw it aside and take a fresh piece.

#### APPLE RECIPES

Written for California Cultivator

**N**OW that the apple season is beginning again a few recipes may serve as reminders.

#### Fried Apples

How well I remember the first green apples that were ready to fry. Mother washed the apples, sliced them, skin and all into a skillet sizzling with plenty of lard, sprinkled

with a little salt, and browned, turning carefully as one does fried potatoes to keep from burning. Then when they were cooked soft, sugar was added, according to taste, the skillet covered and set on the back of the stove to cook slowly for a few minutes. Served for breakfast with toast or hot biscuits.

#### Baked Apples

Pare and core tart apples, place in pan, put butter and sugar in cavity, and sprinkle cinnamon over them, serve warm with cream or milk. An extra fine dish.

#### Apple Salad

Two cups tart apples, two of celery, one cup walnuts, chop all fine, add a little salt. Serve with mayonnaise dressing.

#### Apple Sauce Cake

Stir well together one cup sugar, one of apple sauce, one-half cup butter, one teaspoon soda, one of cinnamon, one tablespoon warm water, one cup chopped raisins, and when all are well mixed, add two cups sifted flour. Bake 30 minutes. This is delicious.

#### Baked Apple Dumplings

Make a rich dough of one-half cup butter, a little lard, one teaspoon salt, two cups sour milk, one teaspoon soda, and flour to make soft paste. Peel and core apples, roll out crust, place apples on dough, fill centers with sugar, roll each apple in the dough, press together very tightly, place in a shallow pan, bake in a hot oven, and serve with cream and sugar.

## CONVENIENCE

All the convenience of gas. No waiting for the fire to burn up. Meals in a jiffy, and a cool kitchen all the time.

Bakes, broils, roasts, toasts. Better cooking because of the steady, evenly-distributed heat. More convenient than a wood or coal stove for all the year 'round cooking—and more economical.

The long blue chimneys prevent all smoke and smell.

In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

# Tractor Demonstration

Written for California Cultivator

REAT interest is shown by producers all over the state in the Second Annual Demonstration, September 18-22, by the Traction Engine and Implement Dealers' Association. The demonstration will be on the 650 acre Vail property on Telegraph Road, two miles east of the end of the Stephenson Avenue car line, Los Angeles. All exhibitors will have plenty of space for a thorough demonstration of their tractors and implements.

Time wasted means money lost, and all implements that are priced cheap-

ly but are poorly built, eventually mean the expenditure of more money and time than would have been spent on a better grade instrument in the beginning. At this demonstration in September the visitor will find good reliable tools and implements being demonstrated, and, like the tractor, there will be one for every man's need and purse.

The demonstration and accompanying exhibit will be of unquestionable interest and value to purchasing agents and master mechanics, because it will give them, as well as the rancher, a splendid opportunity to

observe the latest improved models of tractors and farm implements, and all other time and labor saving devices that go to equip the modern farm.

There is no doubt but that many a rancher would gladly purchase a tractor, but all the high grade farm implements required on his farm, were it not for the initial outlay. To such a man we say: "Has it ever occurred to you, Mr. Rancher, that with the tractor method of farming you will spend less than the time ordinarily required to put in and gather your crops? Hence you will have an opportunity of doing contract work for your neighbor whose ranch is not so modernly equipped, thus making a source of income you never had before. Besides this your present cost of production will be cut at least 40 per cent. So by adding these two factors together, you will see that the first cost does not seem so large. Think it over.

The Association is extremely grati-

fied by the interest shown by prospective exhibitors, and takes pleasure in announcing that the following products and articles will be on display. A full line of electric motors and appliances, furniture and ranch house equipment such as churns, washing machines, etc., food products which will be demonstrated daily, and a showing of the most representative of the many automobiles, motor trucks and accessories on the market today.

The visitor must not forget that aside from the daily public demonstrations between 2 and 4 o'clock, that all firms will give extensive private demonstrations at any time to those who are interested. Another thing—Don't fail to bring with you a note book in which you can jot down the various points of the different machines that interest you.

Summer rate of a fare and one-third for round trip tickets are effective on all railroads from all points in California, Nevada and Arizona.

## Second Annual Tractor Demonstration

The Greatest Exhibit of Tractors and  
Farm Implements Ever Held on the  
Pacific Coast

-- A T --

## Vail Ranch

September 18, 19, 20, 21, 22

Every make of Tractor and Tractor drawn Implement represented in the Southwest, will be shown at this Demonstration. Over 40 Tractors will be shown under all working conditions.

There will be exhibits by the majority of well known Oil Companies, Automobile, Auto Trucks and Accessories, Carburetor manufacturers, Ford attachments, etc.

### Reduced Rates on All Railroads

Have been allowed of one and one-third fare for the round trip. Auto Busses will operate from the end of Stephenson Avenue car line to the Demonstration Field on the Vail Ranch seven miles east of Los Angeles on the Telegraph Road

### Traction Engine and Implement Dealers Association of Southern California

115 So. Los Angeles St. Los Angeles, Cal.

### New Record Book for California Producers

The California Cultivator has just published a new and most useful Record and Account Book for California. Fruit Growers, Farmers, Live Stock Men, Dairymen, Beet Growers, Poultrymen, and all other California Producers,—something that has long been needed but never before attempted, to suit the peculiar diversity of products of this state.

Among the special pages provided are the following:

"Fruit Crop Record," "Live Stock Record," "Poultry Record," "Daily Record of Labor," "Individual Tree Record," "Dairy Record," "Farm Crop Account," "Live Stock Account," "Household Expenses," "Field Expenses," "Cash Receipts," "Inventory," and others that form a complete, easy-to-keep record system.

There is nothing complicated about this Account Book but it is complete and will be of great value to anyone wishing to know "where the money goes," which crops pay and which do not, who owes you and how much, and many other things to which you may quickly refer.

A copy of the California Cultivator Farm Record and Account Book will be sent to any address prepaid and a year's subscription to California Cultivator, new or renewal will be credited upon receipt of \$1.25. Send all orders to

California Cultivator

115-117 No. Broadway

Los Angeles

## How to Dry Corn

LD timers remember with keen relish the dried corn of earlier days, and housekeepers of today will find corn dried by artificial heat delicious in flavor and superior to canned corn.

Select young, tender corn of an excellent variety. If field corn is used, select as you would for cooking. Boil or steam on cob eight to ten minutes, using one teaspoon of salt to a gallon of water. Drain and with sharp flexible knife cut from the cob, cutting off first the top of the grain, then half way down to the cob, then scrape or press out the remainder, being careful not to get the chaff. Spread in a thin layer on the tray of the dryer and lay thermometer in tray. Begin drying at 110 degrees and raise temperature gradually to 145 degrees Fahrenheit. Dry three to four hours, stirring occasionally to get uniform result.

A little experience will enable you to determine when the corn is prop-

erly dried. It should feel tough without being moist, but not too rattly hard. Place in boxes when cool, and once each day, for three or four days, pour from one box to another to insure a uniform degree of moisture. This process is called "conditioning." If the corn seems too moist, return to drying trays for a short while.

Dried vegetables and fruits should be stored so as to protect from moisture. A cheap solution is to place small quantities in paper bags—say enough for a meal or two—and store in tightly covered lard tins. Examine next day and if "sweating," dry a little more. To prepare dried corn for cooking, soak two to four hours, allowing two cups of water to one cup of corn and use as fresh corn.

This dried corn without any further cooking makes a delicious breakfast food when served with fruit or eaten with milk. If desired for this purpose, however, it should be cooked 15 minutes instead of ten before drying.—Food Conservation Bureau.

## A Glimpse at the World's Markets

A feeling on the part of consumers caused San Francisco Exchange prices to hold level on butter and eggs and finally to start a sharp decline, though some have charged this decline to the taking of storage off the ice and throwing on the market. Prices have dropped, so it is asserted new eggs will go into storage.

A car of live Eastern poultry is on the way to San Francisco. It is not thought this will affect present prices. Receipts of local produced stock have been heavy and stock is looking exceptionally fine.

Cheese is now commanding the best price for some years in the San Francisco market.

Calgary reports sale of 150,000 pounds of wool at an average of 60 cents. Some fine quality stuff brought 74. Last year's average for that section was less than half the average on this sale.

With the feeling that wheat will be under federal control market remains easy and speculation has been reduced to the minimum.

Government crop report places the California olive crop at 67 per cent of normal. This means a short crop when needs are great. Normal crop of the state is 8000 tons, and the more pessimistic predict this season's output will not be over 2500 tons.

Los Angeles has had a serious decline in cantaloupes the past week, and on some days the crop was practically given away.

An inspector from the state of Washington is in Stockton inspecting an 80 carload lot of potatoes which, if they pass inspection, will be shipped to Se-

attle. He reports the infestation of tuber moth light.

The logan and raspberry crops are practically marketed, the season having been much later than ordinary because of the cold, late spring. Strawberries will continue to fill the market during the rest of the year.

New rice will not be on the market before October, or possibly November. This is later than Southern rice, which will begin marketing in September. Hawaiian rice is already being harvested.

All beet sugar sections are pleased at the new prices, \$6.00 per ton for 15 per cent beets. California's production of beet sugar will be nearly 5,000,000 bags, which will be about a quarter of a million bags higher than last year. Harvesting in other states than California does not begin before the middle of October. One citrus products company at Upland, San Bernardino County, has handled over 200,000 pounds of cull oranges and lemons this season which have been made into high priced products.

The continued dry weather has greatly lessened the raspberry crop of Bellingham, Washington. Raspberries are a great product of this district and the loss on the growers will be heavy.

Last year's shipment of rice from Hong Kong to the United States nearly doubled those of the previous year. United States Commerce Reports states: "Most of the rice sent to the United States was for transshipment and resale to Central and South America and the West Indies. Prospects are that trade during 1917 will depend entirely upon the amount of cargo space available. Crops in all producing countries in the Far East are unusually large, and a great deal of rice harvested in both 1916 and 1917 will move if freight space can be had at a fair rate."

## HAY

Under date of August 11, Scott, Magner & Miller say:  
Receipts of hay for the past week 3152 tons. Last week 2085 tons, and the week before 1785 tons. From the present outlook more or less of this year's crop is very likely to be damaged unless the car prospect is improved. Trade has become better as receipts have increased and the market has been well maintained at current prices. New straw has made its appearance and is now quoted.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market. For prices to consumers charges of cartage, commission and handling expenses must be added.

# Citrus Fruit Market

LOS ANGELES, August 15, 1917.

The orange market is somewhat easier. Shipments have been fairly heavy with large quantities of Eastern fruits filling the markets. Many sales have been made, however, above the \$4.00 price. The lemon market is not so spectacular as a couple of weeks ago but long prices are still being received.

## Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 35,826 cars, lemons 7156, total 42,982. To same date last season; oranges 28,253, lemons 6174, total 34,427. From Central California to date this season; oranges 5042 cars, lemons 164, total 5206. To same date last season; oranges 5398, lemons 146, total 5544. From Northern California to date this season; oranges 845. To same date last season, oranges 610, lemons 1.

## FROM THE AUCTION

August 8  
New York: 21 oranges, 1 grapefruit, Val. \$2.65 to \$4.55.

Philadelphia: 4 oranges, 2 lem. Val. \$2.00 to \$4.35. Lem. \$4.00 to \$7.75.

# WASHING EXHIBITION SHEEP

Washing exhibition sheep, when properly done, is not only a benefit so far as looks go, but it is very beneficial in freeing the pores of the skin of gummy and other foreign matter. It promotes the proper flow of yolk, which is the natural lubricant of the wool, and thereby stimulates a healthy growth of that important feature of the animal. Many of the leading English exhibitors wash their show sheep as soon after shearing as the weather gets warm and pleasant. Warm water should be used; that is, water with the chill taken off. Castile is a splendid soap for use in washing sheep. Washing should be done in the dipping vat. It is important that after the animal has been washed every trace of the soap be removed by thorough rinsing. Soap makes the wool dry and brittle. Some dip their sheep a month or so before show time and shape them with the shears while they are still wet; the wool cuts much easier when wet than when dry. Moreover, if shaped when dipped the fleece appears more uniform in color, especially where coloring is not used in the preparation of the animals for show. A well known and highly successful exhibitor of Longwool sheep once informed us that he always washed his sheep just after shearing and again some little time previous to the opening of the show season. He allowed time enough to allow the natural oil to flow in profusion so that the wool would assume a natural, oily appearance. He remarked that while many did not wash their show sheep he always considered that it was time well spent to do so.—Shepherd's Journal.

**GIANT**

# Your own soil is full of potash now

There is no question about it. Chemical analyses prove it. Experiments with crops prove it. There is enough potash in your ground now to grow all the crops that you will ever plant. The problem is how to free it, how to make it available for the roots. Tillage will free the potash, completed by lime, decaying roots and green manure. Also will free large quantities of natural phosphorus.

The best way to release plant food is to blast the soil with

## GIANT FARM POWDERS

STUMPING — AGRICULTURAL

Blasting is tillage, tillage of the most thorough and intensive kind known today, more effective than can be secured in any other way. Blasting followed by proper farm practices will release the potash. It starts in motion the processes that will free the potash and phosphorus in your soil and increase the nitrogen supply.

To get the ideal results in subsoil blasting, use Eureka Stumping Powder—one of the Giant Farm Powders. It has a disruptive, heaving, action—exactly what is needed for breaking up the subsoil or hardpan.

## Can You Spare a Few Hours Each Week to Handle a Profitable Local Agency?

We need a representative in each county to put the Fruit Growers, Live Stock Men, Farmers, Dairymen and Poultrymen in touch with the money-making ideas, results of experiments and real farm and live stock information of value to be obtained from California Cultivator.

Only a small part of your time is needed each week to make money under our plan. We want to secure the services of men and women who can present a meritorious offer. You don't have to have previous experience. If you can do as well as others who had no more training than yourself, you can make splendid wages just for your spare time.

Our proposition interests every producer. There is an opportunity here for you—if this fits your case. If it does write to

## New Record Book for California Producers

The California Cultivator has just published a new and most useful Record and Account Book for California Fruit Growers, Farmers, Live Stock Men, Dairymen, Beet Growers, Poultrymen, and all other California Producers,—something that has long been needed but never before attempted, to suit the peculiar diversity of products of this state.

Among the special pages provided are the following:

"Fruit Crop Record," "Live Stock Record," "Poultry Record," "Daily Record of Labor," "Individual Tree Record," "Dairy Record," "Farm Crop Account," "Live Stock Account," "Household Expenses," "Field Expenses," "Cash Receipts," "Inventory," and others that form a complete, easy-to-keep record system.

There is nothing complicated about this Account Book but it is complete and will be of great value to anyone wishing to know "where the money goes," which crops pay and which do not, who owes you and how much, and many other things to which you may quickly refer.

A copy of the California Cultivator Farm Record and Account Book will be sent to any address prepaid and a year's subscription to California Cultivator, new or renewal will be credited upon receipt of \$1.25. Send all orders to

## Boys Clubs a Factor in Arizona Production

M. E. Bemis Writes for Cultivator of Educational Labor Movement in Arizona, Which Really Led to an Economic Advantage of Some Magnitude in Crop Harvesting. A Great Asset for Another Season. See Cover Illustration

**S**HORTLY after the present unpleasantness with Germany had become a certainty and we were having the seriousness of the situation, and particularly the food shortage, brought home to us, a meeting of those who were supposed to be influential in agricultural matters was called by the president of the Arizona State University, the dean of the college of agriculture and the superintendent of agricultural extension, to be held at Tucson.

We met "pursuant to call" as the reports read. All phases of the food problem were discussed—that is all except one. We were advised to grow onions on our front lawns and chickens, rabbits and pigeons in our back yards. We were almost persuaded to plow up the city parks to plant potatoes. We were advised to make every available acre produce its maximum and we were to make other acres available by one means or another.

Experts on water supply told us of the water conditions and proved that we had ample water to cultivate many thousands of acres not now under cultivation.

Canning experts told us that we must preserve all surplus fruits and vegetables and raise more so that there would be more surplus to can.

Insect specialists told us we must make war on the bugs if we would have food to feed our soldiers who were to fight the Kaiser.

Seed experts told us of the shortage of seed and warned us against waste of seeds.

Market experts told us that we should and that we could prevent waste of food by giving more careful attention to preparing foodstuff for market.

So it went through all the different lines of agricultural activities, each one telling how by a little extra work we could add a tremendous amount to the food supply. It was all truly inspiring, and some of us could already in fancy see the end of the war. Curiously enough almost everything suggested meant more work, but those who had been asked to tell how more food could be produced, and more of that which was to be produced saved, were not supposed to consider such a minor detail as a little extra labor.

By and by the experts, and the teachers, and the specialists were all through and Dean Forbes called upon the representatives of farmers' organizations present to state their views and experiences and offer suggestions. Finally when everyone seemed to have had his say a big man with a bald head and a kindly smile came forward and was introduced as Mr. Orme of Maricopa County, and Mr. Orme of Maricopa County proceeded to drop a bomb in the meeting. He said: "Gentlemen, our

most serious trouble is a shortage of farm labor and a lack of some system of standardizing the labor that we have. Each farmer pays his help according to his own scale and regulates the hours of labor as best he can. Too often it happens that the same wage is paid to all laborers alike without regard to experience or ability. This lack of system is demoralizing to labor conditions. We were short of farm laborers last year. Many hundreds of acres of alfalfa might have been made into hay which for lack of labor was fed off by steers.

We could have planted more of the grain sorghums and more corn had we not felt that it was useless to plant crops that we could not find help to harvest.

"Today we are talking of increasing our crop production to meet needs such as the world has never faced before, and we are ignoring entirely, or almost entirely, the fact that we are facing a labor shortage that is to become more and more serious as men by the millions are drawn for our army and navy, for building ships and the manufacture of munitions. We cannot hope to increase our crop production to any considerable extent unless we can increase or make more efficient our present supply of farm labor."

This was the bomb. Previous speakers had referred in a casual way to the necessity of increasing labor by possibly encouraging women to drive mowers, rakes and cultivators. We had been advised that Sunday work would be looked upon with less disfavor, and we had been told that farmers in Europe were making longer days and forgetting holidays, but we had not had the matter of the

importance of farm labor brought home to us in so forcible a manner before and in a way which made it clear to us that, important as all the suggestions had been, the one big thing necessary to increase food production was to increase farm labor.

Continuing, Mr. Orme said: "As one means of helping out the situation we should mobilize the school boys of the country, those between the ages of 14 and 18 possibly. These boys should be organized under some sort of a military system, with camps and complete supervision. In this way we can utilize a great deal of labor which will otherwise be idle or inefficient, and at the same time the boys will be the better for the experience."

There was more said regarding the regulation of the hours of farm labor and standardizing wages, but with his talk on the organization of the school boys, was born the big idea of the "Boy's Work Reserve," the first, so it is said, that was organized in the United States and which has been patterned after in hundreds and possibly thousands of camps throughout the country.

A few days later this plan was discussed at a meeting of the Phoenix Rotary Club and the organization and supervision of the Boy's Work Reserve outlined and enrollment immediately begun. Four of the high school instructors, including the head of the agricultural department, were appointed to look after the welfare of the boys and carry out the plan. One of the instructors was made commissary commander. A local lady physician who had given a good deal of thought to the study of dietetics prepared a menu. The sanitary conditions were looked after

most closely. Each boy was expected to keep his cot and personal belongings in first class shape.

The amusement features were looked after by the local Y. M. C. A. Regular hours were set for rising, breakfast, military drill, inspection of cots, work, the mid-day meal, afternoon work, supper, recreation, "lights out" and sleep.

There were those who prophesied that the whole thing would prove a failure, that most of the boys being unused to work would find the regular hours and the routine irksome and would quit. There were some of course who expected that the boys would get sick or be unable to stand the work, but all of these doubting Thomases were doomed to be disappointed.

One hundred and twenty-nine boys were enrolled and went into camps May 28. Fifty-seven of these boys worked every day for two months. Seventy-three boys won honors and an outing in the hills, for good conduct and steady work.

Some of the younger boys were allowed to work only seven hours daily. In fact the hours were regulated according to the age and the physical strength of the boys, from seven to eleven hours.

Twenty-seven different farmers or firms were worked for during the season. A total of 2220 acres of cotton was hoed by the boys. Twenty-five acres of potatoes were dug and 85 acres of cantaloupes were picked 20 times. Different kinds of work brought different prices, and the boys were paid according to what they could actually earn. This varied from 15 cents to 40 cents per hour. The total amount earned during the two months was \$7,670.45.

July 28 the camps were disbanded that the boys might rest up for school. During the two months two separate camps were maintained. The conduct of the boys was very commendable at all times and the work done was in all cases highly satisfactory to all employers.

At the end of the two months period it was felt that it would be better to disband and give the boys a little rest before school. There were no accidents of any consequence and the health of the boys was excellent at all times. That this most excellent record be not broken was in part the inducement which decided those in charge to disband temporarily.

If labor conditions should be such as to warrant, it is likely that the Boy's Work Reserve will be called out this fall for a period to help save the crops, but whether they are called out again this season or not they have aided very materially in making this season's crops and in setting an example to other school boys as well as to older men in doing their "bit" for the country.

## What is a Ripe Washington Navel?

No Standard Entirely Satisfactory. Extended Experiments by the U. S. D. A. Citrus By-Products Laboratory Form the Data From Which Prof. E. M. Chace Makes Deductions

**S**INCE the publication of the standard of maturity for Washington Navel oranges by the bureau of chemistry in 1915 much interesting comment upon it has been made both by individuals and the press. This standard, popularly known as the 8 to 1 test, was first made public in the fall of 1914 as a tentative standard and was finally adopted after another year's investigations.

The standard depends upon the ratio between the soluble solids and the citric acid contained in the juice of the orange. The soluble solids of the orange consist of from 65 per cent to 80 per cent sugar, the remainder being chiefly citric acid, soluble forms of nitrogen, pectin, and other non-sugar material.

During the first season after the test had been published and given to the California growers many interesting phenomena were discovered by various operators who were constantly testing fruit throughout the citrus regions. It soon became apparent that very green fruit would in many cases pass the test, owing to the fact that the acid had not yet reached the maximum. In the growth of an orange there is a period when the ratio between sugar and acid is comparatively high, and as the fruit matures the acid increases together with the sugar until the former reaches its maximum, after which it will decrease while the sugar continues to increase. This often results in an abnormally

## The Persimmon

By T. Kiyono before Alabama Horticultural Society

HE popularity of the Japanese persimmon is not confined entirely to California. We note in the "American Nurseryman" that T. Kiyono discussed the subject with reference to its adaptation to the Southern states. Because of California's priority in testing this fruit results of experiments there are referred to. Many have believed for years that California was not giving as much attention to this "food fruit" as it should. There are many ways in which it may be processed, and it is one of our best shipping fruits. Mr. Kiyono says:

There are many reasons why the Japanese persimmon has been neglected by Southern fruit growers who have the monopoly, at present time, of growing this delicious fruit. The most important of all drawbacks is that the general public is almost totally ignorant of the value of this fruit or lack knowledge of when it is the proper stage of ripeness to be served. Not only this, the name of persimmon reminded many people of small, seedy and inferior wild persimmons and the desire to taste this new and entirely different fruit had not been aroused; thus majority of people, even in this district, where Japanese persimmons is perfectly at home, have never tasted any Japanese persimmons.

Those who used to despise the Japanese persimmon are now great admirers of this fruit after the trial of right kind, and I know several Americans of high taste who prefer Japanese persimmon to any other fruits. The rich taste of Japanese persimmon does not agree with few persons, but majority of people like it very much at their first trial, although the taste for this fruit has to be cultivated, and as the rule, they like this fruit better and better as they get well acquainted with it. It is a very unfortunate thing that some people have tried Japanese persimmon at wrong stage of ripeness, who will never want to try any more again, and those are the people who will say almost anything against this fruit.

### Dark and Light Fleshed Sorts

When we say "Japanese persimmons" that includes more than two dozen varieties of fruit belonging to two very distinct groups: one group which includes several varieties of dark fleshed sorts with seeds but edible while still hard. Most persimmons we find on present market have to be soft before being eaten unless artificially treated, and while some people who do not like custard-like consistency of this sort are very fond of dark-fleshed sorts which can be eaten out of hand while still hard, just like an apple. Most dark-fleshed sorts are smaller than others and the presence of seeds is objectionable but the quality of flesh is excellent and more attention should be paid to educate the general public with this sort which do not have to be certain degree of ripeness when eaten. Light-fleshed sorts have to be soft when served but with such varieties as Tane-nashi, Hachiya, Tamopan, etc., they must not be too soft. They are ready to be served as soon as the bottom part of fruit close to calyx gets softened. This is the part of fruit which is the slowest to lose astringency. 'Tsu, Yemon and several oth-

ers do not lose astringency till they are so soft that one can hardly handle them properly unless artificially treated, and from this reason they are not very desirable varieties to plant for fresh fruit. Well ripe cold persimmon, cut in halves and served with cream and sugar is really a fruit from the Garden of Eden.

### Good Qualities Not Known

Fruit consuming public is not to be blamed for the lack of interest in Japanese persimmon because growers and fruit dealers have failed to educate the public with a new fruit of this nature. The fact that persimmon is one of the richest flesh-building foods for men and animals, equaled only by date but far superior to figs or grapes, must not be overlooked. Introduction of Japanese persimmon as the staple food affords almost unlimited possibility to enterprising growers or dealers. Not only growers failed in marketing end of persimmon but they also failed to make more study as to the best varieties to plant, care of trees, fertilization, thinning of fruits, pollination, etc., The very reason that Japanese persimmon can often endure great deal of abuse and yet bear profusely, leads most growers to neglect their orchards. Often times, neglected trees over-bear themselves to death. Another mystery of Japanese persimmon with the exception of Tane-nashi was that some trees bear heavy crop of fruit in some year, and again dropped pretty near all fruit in other years, in spite of good care and fertilization. The reason is that most of Japanese persimmon cultivated in this country do not bear any staminate flowers every year, but they produce them once in a while. A few staminate flowering sorts have been introduced in the last few years, which have to be planted among other persimmon trees for pollination to insure regular crop of fruit. Thinning of fruit is almost as important as the pollination because most Japanese persimmons have the tendency to over-bear themselves whenever fruit is set, to such an extent as to break trees down or stunt the trees almost permanently. If the thinning of fruit is persistently followed in connection with good cultivation, proper fertilization and pollination, one can expect regular crops of excellent fruit. Most of those varieties which are considered best in this country belong to those of lesser importance in Japan and our best sorts have not been tried out in this country long nor wide enough to say anything of their value at present, but much can be expected from newer and better sorts which are not known to the trade of this country.

### Artificial Ripening

To market the fruit to the best advantage, growers should familiarize themselves with several methods of artificial ripening. The method most commonly used in Japan is to place well-colored but firm fruit in the keg which was used for "sake," an alcoholic liquor, and keep them air tight from one to two weeks, when the astringency will disappear, while the fruit remains firm. About seven years ago, the bureau of chemistry discovered that if persimmons were placed in carbon dioxide for two to seven days astringency of fruit disappears without making fruit soft nor injuring quality. Those who wish to learn the

detailed account of this process should get Bulletin 141 and 155 from the department of agriculture. There are several other methods of artificial ripening, which I shall not enumerate at this time.

### Dried Persimmons

A large quantity of persimmons dried commercially in Japan, following same fashion as date and fig. Both sun and artificial heat are used for the process, and the product is just like a great, big date without any seed in it. Dried product of average varieties is about 20 per cent of fresh fruit in weight, having very high food value and keeps well without any preservatives, on account of its high sugar content. Dried persimmon is very palatable, and many people prefer them to date or dried fig and any foreigners who travel through Japan will hardly forget its taste. We make many other by-products from persimmon, such as a very valuable preservative for cloth and paper from unripe fruit, and most delicious jelly-like candy is made of ripe fruit. Those who want to know different dishes which can be prepared of persimmons do not have to go to Japan to get recipes, but I refer to Farmers' Bulletin 685, where Mr. Fletcher, of Washington, gave more than a dozen recipes which can be prepared of native persimmon, where we can substitute Japanese persimmon to better advantage.

### Demand Growing

One very encouraging fact to growers of Japanese persimmon is the public demand is increasing quite rapidly. A grower in Fairhope, Alabama, told me that he had to pay freight on a shipment of persimmons to Chicago, seven years ago, but two years later another grower of the same place told me that she received \$8.00 per barrel in the Chicago market. I see now great many more persimmons on Mobile market than five years ago, yet all fruit dealers with whom I made inquiries told me that they can sell persimmon easier now than a few years ago, and many have reported to me that they could not supply the demand.

To summarize the foregoing discussion: Japanese persimmon is one of the most delicious and attractive fruits which have been neglected from the lack of public demand, mainly because it was not educated regarding this new fruit; growers did not make strong effort to advertise this flesh-building food, and they were handicapped by lack of cultural knowledge; growers failed to perfect the method of marketing by the assistance of artificial ripening; growers failed to develop by-product such as dried persimmon, persimmon jelly, etc.

We know now what were the drawbacks of the Japanese persimmon industry in this country. Opportunity is knocking at our doors. Let us grasp it to profit ourselves as well as the general public.

### HIS QUEER FEELING

A naval official praised at a dinner in Washington the old sea dog.

"One of these typical old sea dogs," he ended, "was persuaded one day in Philadelphia to attend a tea. I met him a short time afterward and said:

"Well, Marlinspike, I hear you have been doing tea parties in Philadelphia?"

"Yes, sir" the old salt replied "I did go to one tea party, sir."

"And how did you feel there among all those ladies?" I asked.

"I felt like a sperm whale doing crochet work," he replied."

## Agricultural Restoration in France

**I**NTEENSELY interesting is the account in a recent Scientific American of the agricultural work done by the French army in lands from which the Germans have recently been driven. Tree surveying has played a most important part in this restoration.

Truly remarkable, then, is the announcement recently made by French officials to the effect that work is progressing rapidly in the devastated districts, and that already there is promise of abundant crops in the recovered provinces. It happens that the Germans, needful of every bit of food they could possibly raise in any of their occupied lands, planted crops in these provinces, fully convinced that they would reap the harvest. And even, to their surprise, they were driven out, or at least decided to execute one of inimitable 'strategic retreats,' they were unable to destroy their plantings.

It so happens that France is an agricultural country, and her army numbers many workers of the soil; so when the French army recovered the provinces the soldiers on furlough offered to work the erstwhile German lands. Implements have been rushed from the interior to the newly ac-

quired regions, and work is proceeding satisfactorily on the military farms. Tens of thousands of acres bear signs indicating that they are 'Cultivated by the Army.'

"The fruit trees which the German invaders ruthlessly slashed and cut down presented a more serious problem. Yet when the French tree surgeons came upon the scene they soon found means of salvaging the grand old fruit trees which were the pride of the former French inhabitants. Correspondents tell us that thousands of these fruit trees are to be seen today in full bloom, with their trunks tied up with bandages in much the same way as a human arm undergoing medical care. Trees cut down have been raised, straightened, and the trunk properly reenforced with stout splints, with the result that many of them have been saved.

"Roads which were full of gaping holes caused by exploded mines, bridges, and other public works have been leveled and replaced. Indeed, all that still remains to remind the French and their British allies that those provinces were converted into a desert by orders of none else than von Hindenburg are the thousands of wrecked homes, churches, town halls, and schools. And these, too, will be speedily replaced by others."

## All Plants Subject to Parasites

All plants are subject to attacks by parasites. These parasitic enemies are different in structure as the plants on which they feed. Some parasites are microscopic plants called fungi, and are the causes of such well known diseases as apple scab, brown rot, and wheat rust. Others are known as bacteria, producing the virulent fire blight of fruit trees. All others are not plants at all but insects.

Of all plant parasites undoubtedly the insects have received most attention during the last 30 years. Their small size has rendered them obscure. Their obscureness has allowed them to multiply year after

year without being combated. Their increasing numbers have resulted in the death of thousands of trees, shrubs and green-house plants each year throughout this country. Hundreds of different kinds of scale insects exist. Some are large and active throughout their entire lives. The mealy bugs of the greenhouse are typical examples. Others are small and sedentary, becoming immovable soon after they begin feeding. The San Jose and citrus scales are well known species of this type. The ravages of such pests are so expensive that farmers of the United States are annually paying thousands of dollars either directly or indirectly to scale insects.

## Fumigate

**S**PEAKING of the necessity for general fumigation the Covina Argus says:

After the completion of a careful summer survey of the citrus groves of Southern California, horticultural inspectors are making reports which are briefly as follows:

"The hot weather of this season has led a great deal of black scale. There are evidences that considerably more scale has been killed by heat this summer than in previous years, owing to the intensity of the heat. But black scale has by no means all been killed. There is plenty of scale in evidence in every locality, which if neglected will seriously affect the crop of 1918 and seriously the crop of 1919. A thorough fumigation must be made in all orchards, to prevent this loss."

Ranchers have come generally to recognize that every year is a fumigation year in the Southern California citrus groves, no matter what has happened to lessen the scale. Hot weather does not assist the situation notably for the rancher to any great extent, for the foundation of scale control lies in the killing of practically all the scale, not 75 per cent of it

nor 80 per cent nor 90 per cent. An efficient control must be one that shows 99 per cent of elimination, or better. One half of one per cent of scale left in the orchards will not harm the orchards, but any larger amount will leave a residue sufficient to cause the loss of a part of the crop, and it is quite likely to be a large part of the crop. Scale in the orchard is one of the greatest causes for crop shortage that the citrus rancher is confronted with.

The situation now confronting the rancher is practically this—that the fumigation this year will have less scale to deal with than in former years, but 99 per cent of the scale now on the trees must be eliminated, or serious crop loss will result.

According to fumigation experts and horticultural men it is now time to begin fumigation in most parts of Southern California. Some groves in this country have arrived at this condition all of a month earlier than is usually the case, owing to the unusual weather conditions that have prevailed. The information is being sent out that ranchers should investigate conditions at once, and determine for themselves if this is true, and begin fumigation at a time when the height of effectiveness can be obtained, and at a time when fumigation companies can handle the business without too much hurry and congestion of business.

CUSTARD APPLE OR CHERIMOYA

In Mexico the common name of this fruit is spelled "Chirimoya." Evidently a different spelling is used in Peru, giving rise to the specific name Chirimolia and the English adaptations,

"Cherimoya" and "Cherimoyer," the latter most commonly used in the British colonies. Though the fruit came to California from Mexico, the spelling "Cherimoya" has been generally adopted.

## Moline Foot-Guide Beet Puller

### Meets Every Condition of the Beet Field

When the sugar factory gives the word to "Pull," be ready with a Moline Foot-Guide Beet Puller to insure quick and perfect work. The Moline Foot-Guide was especially designed to facilitate every operation at harvest time and has advanced features of convenience, adjustments and control possessed by no other beet puller.

### Foot-Guide Control Is Positive and Quick

Irregularities of the beet rows may be followed without regard to movement of team—pulling point always in line and runner lifts whatever front wheels straddle.

Short turn is another exclusive Moline feature. Front wheels may be raised clear of the ground, allowing machine to turn on two wheels at ends of rows—a time saving feature in fields with irrigating ditches.

Large, wide, adjustable main wheels and strong, properly placed standards give correct set to runners, insuring perfect raising of beets of varying sizes, without cutting or bruising them.

Rolling coulters cut trashy tops—prevent clogging. Moline Foot-Guide Beet Puller is built for two or three horses; is extremely light draft, due to four wheel construction and proper balance. High carbon steel construction and strong bracing insure permanently dependable service.

Ask your Moline Dealer about the Moline Foot-Guide Beet Puller, or write us for Illustrated Literature. Address Department 56

### MOLINE Walking Beet Puller

is popular with beet raisers everywhere because of its simplicity and efficiency. Pullers are strongly shaped with an easy downward curve and straight runner—raise beets out of the ground gently without bruising them. Chilled points and diggers add greatly to long life under hard service, are easily detachable. Lifting rods adjustable up or down to meet different requirements.

# STANDARD OF MATURITY FOR THE WASHINGTON NAVEL ORANGE

Continued from Page 171

high ratio for a short period, followed by a normal and lower ratio before the final ripening period sets in. An illustration typical of these cases was found in a Nordhoff grove. On December 26 the fruit from the selected tree in this grove contained juice having 11.8 per cent soluble solids and 1.63 per cent acid, giving a ratio of 7.2. On January 2 the solids had risen to 12.3 per cent and the acid to 1.75 per cent, giving a ratio of 7.0. On January 9 the figures were 12.4 per cent solids and 1.77 per cent acid, the ratio still being 7.0. On January 16 the solids were 12.2 per cent, the acids 1.81 per cent, with a ratio of 6.7. One week later on January 23 the solids were 12.7 per cent, the acids 1.43 per cent, with a ratio of 8.9. On February 1 the solids were 12.5 per cent, the acid 1.46 per cent, the ratio being 8.6. On February 16 the solids were 12.6 per cent, the acid 1.57 per cent, the ratio being 8.0. On February 23 the solids were 12.8 per cent, the acid being 1.38 per cent, with a ratio of 9.3. After that date with one exception the solid-acid steadily increased.

While it had been recognized during the first season that some very green fruit would pass the standard it had not been thought that such fruit would be given commercial consideration. There has unfortunately been some attempt to take advantage of this fact and to ship fruit even before it had begun to approach the final stage of maturity, and the Protective Association in Tulare County in order to meet this condition adopted a color standard which prohibited the sweating of fruit before it had

reached a color in excess of 50 per cent.

It was also discovered that unless the juice was thoroughly extracted from the pulp of the orange that the correct solids-acid ratio could not be determined. Oranges which are very lightly squeezed have a lower solids-acid ratio than those which are thoroughly pressed. This is due in a large part to the fact that the pulp nearest the center of the fruit, which is first removed by the usual method of squeezing, contains more acid and less sugar than that near the rind.

Another phenomenon was brought out in the fact that oranges, the juice of which contained a high percentage of soluble solids and were therefore high in sugar, were found to taste sweeter than those containing a low percentage even when the ratio of acid in the sweeter orange was higher than that in the poorer. This has led to many suggestions for a sliding scale which would exempt from the standard to some extent oranges containing high percentages of soluble solids. Peculiarly most of these suggestions came from regions where the fruit does not mature early and therefore does not attain a high content of sugar soon enough in the season to permit early shipments even under a very liberal sliding scale standard.

Practically no data have been submitted with the suggestions made, and where figures were used as a basis of suggestion they were from a limited number of analyses confined to one or two localities. The purpose of the present paper is to place before those interested in the subject, in a condensed form, such data as have been collected in all districts, which bear upon the question.

The purpose of the maturity standard is primarily to protect the consumer who purchases fruit which is fully colored, under the impression that he is obtaining food which will be satisfactory to his taste. Indirectly also the standard is a benefit to the orange grower in that it assures him that the purchaser will be satisfied with the fruit which he is selling, and in this way create a demand for it. Thousands of dollars have been lost by the California industry in the past by shipment of both immature and frosted fruit, in which the purchaser was unable to detect the defect, and from which he turned after a single experience to other satisfactory fruit which was available at the time.

In the preparation of a sliding scale the first question which must be decided is that concerning the point at which exemptions from the present standard should begin. In the light of our experience, extending over three seasons in California, we believe that an orange should only be exempted after the juice has reached a minimum of 13 per cent soluble solids, but in order to test the question fully a set of sliding scales have been prepared, beginning at 13 per cent soluble solids, and lowering the percentage in one-half per cent steps until 11 per cent soluble solids has been reached.

Thus if a sliding scale should be adopted which was based on 13 per cent soluble solids, fruit must contain juice having 13 per cent of soluble solids or over to come within this scale. Fruit not having reached 13 per cent would necessarily have to pass the 8-1 standard. If however it contains 13 per cent soluble solids it would pass the standard when the ratio of soluble solids to acid reaches 7.5 to 1. Further, if the soluble solids had reached 14 per cent then the ratio

at which the fruit would pass would be lowered to 7-1, and so on as set forth in the following table:

## Scale Based on 13 Per Cent Soluble Solids

Soluble solids in juice	Minimum ratio for passing
13 to 14 per cent.....	7.5 to 1
14 to 15 per cent.....	7.0 to 1
15 to 16 per cent.....	6.5 to 1
16 per cent and over.....	6.0 to 1

The second sliding scale to be considered is based on a minimum of 12½ per cent soluble solids; that is, in order to be included in the exemptions of this scale, the juice of the fruit must contain a minimum of 12½ per cent soluble solids. Fruit, the juice of which had not reached that figure, would still have to pass the 8-1 test. The following table shows the exemptions from the 8-1 ratio, which would be made by the adoption of this scale.

## Scale Based on 12½ Per Cent Soluble Solids

Soluble solids in juice	Minimum ratio for passing
12½ to 13½ per cent.....	7.5 to 1
13½ to 14½ per cent.....	7.0 to 1
14½ to 15½ per cent.....	6.5 to 1
15½ per cent or over.....	6.0 to 1

The third set of tables illustrates exemptions which would ensue from the adoption of scale based on 12 per cent soluble solids, 11½ per cent and 11 per cent.

## Scales Based on 12, 11½ and 11 Per Cent Soluble Solids

### Sliding scale on basis of 12 per cent soluble solids

Soluble solids in juice	Minimum ratio for passing
12 to 13 per cent.....	7.5 to 1
13 to 14 per cent.....	7.0 to 1
14 to 15 per cent.....	6.5 to 1
15 per cent or over.....	6.0 to 1

### Sliding scale on basis of 11½ per cent soluble solids

Soluble solids in juice	Minimum ratio for passing
11½ to 12½ per cent.....	7.5 to 1
12½ to 13½ per cent.....	7.0 to 1
13½ to 14½ per cent.....	6.5 to 1
14½ per cent or over.....	6.0 to 1

### Sliding scale on basis of 11 per cent soluble solids

Soluble solids in juice	Minimum ratio for passing
11 to 12 per cent.....	7.5 to 1
12 to 13 per cent.....	7.0 to 1
13 to 14 per cent.....	6.5 to 1
14 per cent or over.....	6.0 to 1

(Mr. Chace has given tables showing percentages of fruits in different sections of the state at certain picking periods. Because of length these are omitted.)

The fact that no increase in the amount of fruit which could be shipped from a district would be obtained by the introduction of these sliding scales may be due to two reasons: First: A large percentage of the samples collected may have passed the 8-1 standard. Districts of this type include Orange, San Bernardino and Riverside Counties. There are subdistricts however where some increase in early shipment would be permitted by the adoption of a sliding scale, which is not apparent when the averages for the counties are considered. A striking case in point is the district of Upland, where of the 41 samples examined before February 15 but 12 per cent passed the 8-1 test; while based on 13 per cent soluble solids the number would have been more than doubled and more than tripled when the scale was based on 12½ per cent. In Orange and Riverside Counties the local districts coincide reasonably well with the county averages. Second: While a small number of samples may have passed the 8-1 test there may not be a suf-

ficient number of samples contained above the average percentage of soluble solids to bring the fruit within the exemptions permitted under sliding scale. In other words, in some districts good fruit would not be affected because it already passed 8-1 standard; in other districts poor fruit would not be affected for the reason that it does not contain a sufficient amount of soluble solids to come within the exempted classes.

Considering the matter as a whole while there are undoubtedly exceptions to the rule, it does not seem that the adoption of the sliding scales here presented would materially increase the volume of early shipments. Of course it can be said that the exemptions are not sufficiently liberal to permit any considerable increase but as has been previously stated the purpose of the standard is first of the protection of the consumer, and when we consider the averages of the districts it does not seem that a sliding scale is worthy of adoption which is based on less than 13 per cent soluble solids, or certainly less than 12½ per cent; for if percentages lower than those are considered the scales will be based on figures which is not much above the average of that sent from California during the shipping season.

Among other suggested standards which have been offered as a substitute for the 8-1 standard is the color standard. It is a well-recognized fact that the oranges in the several districts of California do not color with equal rapidity. In some districts oranges color before they sweeten in other districts they are quite sweet before colored, and the trouble with the color standard is that it will permit the shipment of very sour oranges from some districts and will prohibit the shipment of sweeter material from other districts. It is possible that this discrepancy may be taken care of by sweating in districts where the coloring is not so rapid and that the market will take care of the more and more poorly-colored fruit.

The following summary is made from data collected during three years' work on the color shown in samples of oranges received at the laboratory. In the summary the term "substantially colored" is used to denote color in excess of 75 per cent. This is merely a relative term and the division is made at this point solely for the reason that it was considered that oranges which had colored to this extent might be shipped without sweating.

In Butte County 21 samples of standard oranges were substantially colored against 29 samples of standard oranges, and but two of the standard samples contained less than 75 per cent color. In Sacramento County the ratio is very different, for 15 samples of standard oranges were substantially colored while all of the standard samples (12 in number) were above 75 per cent. In Placer County the ratio of fully colored standard samples to fully-colored standard samples is 9 to 3; in Solano County, 1 to 2. In Fresno County on the other hand but 12 samples were below the 8-1 standard were substantially colored; while 34 standard samples were up to that mark. Tulare County, which is one of the districts where the fruit becomes sweet before it changes color, shows but 4 substandard samples colored above 75 per cent and 444 standard had reached that color. In Los Angeles County 147 substandard samples were 75 per cent to 100 per cent colored against 360 standard samples of the

color. In Orange County there e but 9 substandard samples substantially colored against 57 standard ples of the same color. In San ardino County the ratio was 40 191. In Riverside County only 1 standard sample was substantial- colored, while 98 samples above dard had reached 75 per cent. In tura County the ratio is 15 to 53. onsidering these data from anoth- point of view it was seen that in e County with the samples below tio of 6-1 the greater part are very an; with a ratio of 6-7 the oranges about evenly distributed between four classes of color; from 7-8 the ority are fully colored. The stand- oranges are practically all sub- tially colored. The same is true acramento County when fruit be- a ratio of 6-1 is considered, but n it reaches a ratio of from 6-7 a ter part (that is, 19 out of 24 ples) is substantially colored; n a ratio of 7-8, 16 out of 17 were ntially colored, while all the idard fruits had reached that col- In Placer County the same fact is true for fruit below the 6-1 o; between a ratio of 6-7 the sam- were evenly distributed as to r, but from 7-8 and above standard samples were fully colored. In sno County the color begins to ap- r in samples with a ratio of 6-7; een 7-8 nearly 50 per cent of the ples were fully colored, and above ver 80 per cent had reached the stage of color. In Tulare County w 6-1 no samples are substantially red; samples having a ratio be- en 6-7, only 7 per cent are sub- tially colored; between 7-8 25 per t; above standard over 75 per cent he samples are well colored. In Angeles County samples having tio below 6-1 over 20 per cent are l colored. Those having a ratio een 6-7 over 50 per cent are well red; those with a ratio of 7-8 rly 90 per cent are well colored, le samples above standard are ctically all fully colored. In Or- e County none of the samples be- ratio of 7-1 were substantially col- ; 9 out of 15 samples with a ratio een 7-8 had reached that color, le all of the above standard sam- were well colored. In San Ber- dino County 15 out of 21 samples a ratio of 6-7 were well colored; ut of 38 with a ratio of 7-8, and r 90 per cent of the standard sam- were well colored. In Riverside nty also over 90 per cent of the ples were substantially colored. Ventura County all of the samples mined were fully colored, 4 out of aving a ratio of 6-1 to 7-1; 11 hav- a ratio of 7-1 to 8-1; and 53 being ve standard. Considering these data as a le it will be interesting to com- e the averages obtained on all the ples for the period during which k was carried on. These averages, ether with the number of samples, given in the following table:

District	Number samples	Solids	Ratio
te	110	12.17	7.3
ramento	96	11.17	6.4
er	22	12.32	6.5
sno	67	11.49	9.6
are	808	11.91	9.3
tura	68	13.42	9.4
Angeles	562	12.47	9.1
nge	73	12.00	9.7
Bernardino	358	12.95	9.9
erside	172	12.65	11.0
Averages		12.25	8.8

Summary  
The introduction of sliding scale standards would not allow any considerable increase in the early shipments of oranges. While certain limited lot- ties might increase early ship- ments by such changes in the present dard, the increase in shipments ould be comparatively insignificant. Adoption of a sliding scale based 13 per cent or 12½ per cent soluble ds would have very little effect n the industry.  
The adoption of a color standard permit the shipment of a con- siderable quantity of oranges which e not reached the 8-1 test in a at majority of the districts, and in ew districts will permit the ship- of very immature and sour or- es.

# Grapefruit in California

THE question of growing the grapefruit, or pomelo, in California is a live one, though some have urged that the planting be very limited. For many of us the Califor- nia fruit with its "tang" is far more appetizing than the sweeter, juicier Florida fruit. The trade generally does not agree on that point, hence the warning "plant with care."

At the last state fruit growers' convention held in the southern end of the state, at San Bernardino, A. D. Shamel of the United States depart- ment of agriculture discussed the pomelo question so fully that we quote from his paper:

The poor reputation of California grapefruit as a whole, particularly in many Eastern markets, has led many people to doubt the advisability of any attempt to grow or at any rate ex- tend the culture of this crop commer- cially in California. Amongst the causes for this condition three of spe- cial importance may be mentioned: first, the planting of inferior varieties or those not suitable for California conditions; second, the planting of grapefruit trees on soils and under other conditions not adapted to the production of the best qualities of fruits; and third, the attempt to mar- ket the fruit before it is ripe.

The early plantings of grapefruit in California were of Florida varieties which were selected without much knowledge of their adaptability to California conditions. It is only in recent years that any real knowledge has been developed of the compara- tive value of several varieties for this state. Of the varieties fruited so far, one, the Marsh Seedless, stands out clearly as particularly adapted for California conditions and is of genuine commercial value.

It is becoming more and more evi- dent that the grapefruit trees planted on rather light, porous, and sandy soils produce fruits of superior com- mercial quality, color, and texture of rind to those planted on the heavier clay soils. That there is a relation between the character of soil and com- mercial quality of fruits can hardly be doubted. Many of the older grape- fruit orchards were planted on the lower valley and heavier soils, while most of the more recent plantings have been made either on higher lands having lighter soils or on soils possessing the desirable characters of texture and other conditions found by experience to be best for the pro- duction of this fruit.

A part of the California grapefruit crop is usually picked green or before it has fully ripened, and as a result its quality and flavor is frequently poor. An early variety is needed, producing fruits which will ripen from October until February, and this is one of the achievements worthy of the serious attention of citrus breed- ers and propagators. As a rule the California grapefruit crop of the es- tablished valuable variety ripens from May until July and some of the fruits can usually be held on the trees un- til September. Under proper condi- tions these late fruits can usually be held in storage safely until about the last of November with constantly im- proving flavor and little loss of weight from shrinkage. These condi- tions are: first, a uniform, cool tem- perature; and second, a uniform con- dition of humidity of about 90 per cent. The uniformity of humidity can be secured by ventilation and the use

of proper humidifiers. The condition of humidity in the storage rooms should be carefully determined by means of the sling psychrometer two or three times each day. Naturally the fruits for storage must be picked with the best of care in order to elim- inate so far as possible all mechan- ical injuries which are likely to re- sult in decay, the development of which is particularly favored by the high humidity necessary for success- ful storage conditions.

## Varieties

Of the Florida varieties of grape- fruit planted in California the ones most frequently tried have been the Triumph, Duncan, and Marsh Seed- less. The writer has been shown in- dividual trees of other varieties in several Southern California orchards, but knows of no commercial plantings in bearing of other varieties than those named above. Trees of so-called seedling origin or of uncommon and probably comparatively recent in- troductions have also been found in fruit in a few places. As a matter of fact the writer knows of no careful and adequate comparative trial of grapefruit varieties in California. The extensive propagation and planting of a carefully selected and extensive col- lection of types and varieties under- taken by the citrus experiment sta- tion at Riverside will undoubtedly give us much needed and reliable in- formation as to the comparative mer- its of the established varieties from Florida and other grapefruit districts in this country and abroad, for Cal- ifornia conditions.

The Triumph grapefruit trees in Southern California observed by the writer produce large yields of rather small fruits, containing many seeds, usually from 25 to 50 in each fruit. This character bars this variety from serious consideration for commercial planting in California.

The Duncan grapefruit trees ob- served in Southern California tend to produce rather large, round fruits, usually containing more than the number of seeds desired for market purpose. The fruits observed have had thick rinds as a rule, the quality of the juice was somewhat inferior, and the rag was coarse in texture and very bitter. The last characteristic may have been due to local condi- tions, as no comparison was made with other varieties of grapefruit

grown under the same conditions. The Imperial, Colton Terrace Seed- ling, Auranium, Commercial, and Blood varieties and types of grape- fruit, and the Sampson tangelo, have also been propagated and planted to some extent in California. The re- sults of these plantings have not as yet demonstrated them to be a com- mercial success in California. Simi- lar isolated plantings of related and other varieties of grapefruit are still in the experimental stage so far as California is concerned and need not be considered further in this discus- sion.

The Marsh Seedless, or Marsh, variety of grapefruit has been found to be the best of all the varieties grown in California and in districts having similar conditions. If all of the plantings in California of vari- eties other than Marsh Seedless from which fruits are marketed, were re- placed by Marsh Seedless, either by replanting or rebudding the establish- ed trees, the writer is strongly of the opinion that the result would be very beneficial to the industry as a whole.

According to Hume, the Marsh Seedless variety was introduced in Florida by C. M. Marsh, of Lakeland, Florida. The original tree was said to be a seedling, although the writer wishes to point out the fact that near- ly all fruit growers upon finding an unusual tree in their orchard have called it a seedling. This universal custom is responsible for much mis- information concerning the origin of fruit varieties. The writer would like to suggest to citrus fruit growers and others that unless it is definitely known whether or not a tree originat- ed from a seed or a bud, the origin of the tree be left in doubt and a simple statement of the facts concerning the finding of the tree be made and re- corded. There is no longer any reason or excuse for anyone jumping to the conclusion that an odd or unusual tree must of necessity be of seedling origin.

In connection with the history of the origin of this variety the further statement is made that "this pomelo has not the distinct, pronounced flavor of the typical fruit, but the quality is good and the fact that it is so nearly seedless is a very desirable feature." This statement concerns Florida grown grapefruit and is a comparison of the Marsh Seedless with other Florida grown varieties. It is an illustration of the fact that the behavior of a variety in one sec- tion of the country is not a reliable criterion of its behavior in other dis- tricts having different climatic, soil, and cultural conditions.

### Turkeys and Chickens Poisoned

I had 25 young turkeys of three or four different ages. One day they started taking fits and inside of three hours they were all dead. The next day several chickens died. They just went up to the water and drank and then threw their heads back and took fits. I threw out a beef heart that was covered with red ants and they ate from it. Do you think it might have been the ants? They were used to having fresh meat as we fed them jack rabbits but not that day or the day before, so it was not poisoned rabbits.—Subscriber, Huron.

I do not know how the eating of poisonous ants would affect chickens or turkeys, but the symptoms in this case are those of violent ptomaine poisoning, and I would rather think the meat was tainted and the birds poisoned by it than blame the ants. If the meat was perfectly fresh and sweet, however, we shall have to conclude that the ants either poisoned the turkeys that swallowed them or the meat over which they ran. Won't some reader of the Cultivator who has had experience with red ants come to the rescue and enlighten us as to the probable effect on chickens and turkeys of eating them? As a rule, the birds know better than to touch such things but there may be exceptions.—J. A. K.

### Farm Loan

I wish to know exactly where to apply to get a loan through the federal farm loan board.—Subscriber, Orange County.

Write Federal Farm Loan Bank, Berkeley, for particulars as to organizing a local farm loan board or, better, to learn as to whether one has already been organized near you.

### Trespassing Poultry

Does poultry have the right to run at large, or are the owners required to keep them from doing injury to other people's crops? What are the proper steps to take to prevent this trespass?—Subscriber, Heber.

Unfortunately our laws in relation to livestock at large are in such a condition that legally it is almost impossible to compel a person to keep his stock at home. If one has his place surrounded by "substantial fence" then the law permits collecting damages for any injury the stock may cause. Whether it would construe "substantial fence" to be such as turns poultry no one seems to know. The best way to control such a matter is the exercise of common neighborliness. There are but few people in this world but will not take care of their own stock when requested to do so and where damage is being caused to adjoining property. Of course there is always the stray law, but the cost of having stock impounded and cared for is greater than that which the law compels the owner of the stock to pay for its keep. This permits the overbearing stock owner to cause serious injury to neighbors property.

### Potato Tuber Moth

I send potatoes. What is wrong with them? The infection seems to spread among good ones. What is this bug or insect which infests them? Does it exist in the soil and crawl into the potato or what is its method of work?—Subscriber, Somis.

This is the larva or "worm" of the

potato tuber moth, *Phthorimoea operculella*. They do not exist in the soil, or rather do not inhabit the soil and from there enter the potato, but the egg is laid on the potato, or sometimes on the stem of the growing plant, and secures entrance as soon as hatched, by burrowing. The "worm" will vary from 1-16 to 1-2 inch in length according to the age. The eggs may be deposited on potatoes after digging if they are left exposed in the field or in the shed and in that way the larva which changes its form into the moth perpetuates its species. Your good potatoes should be separated at once from those which are infested and placed where the moth may not reach them to deposit their eggs. Owing to the high price of potatoes it would perhaps be well even to treat those which are infested with carbon bisulphide, putting all the potatoes in a tight box or room and using a pint of carbon bisulphide for every thousand cubic feet of space in the room. The infested potatoes should be disposed of as soon as possible after digging or they will be the cause of serious loss.

### Planting Geraniums

When is the best time to plant geranium hedges where cuttings are to be used?—Subscriber, Somis.

The geranium is an exceptionally hardy plant. It will stand for "slipping" and planting almost any season of the year. The nearest to complete failure we have ever seen has been when they were planted in full flow of sap in the month of June. If they have not been given an abundance of water and are partially dormant, any time from now on would probably prove satisfactory. Some of the best results we have ever seen with geraniums is where the tops have been taken off and been prepared for slips or cuttings, then left in the open air for several days before being placed in the soil.

### Building Brooder House

I am building a brooder house 10x12 facing the south. Am going to put in four sash 34x34 in front. How high should they be from the floor to get the most sun on floor space, and what size brooder stove should I use? What suggestions can you make as to ventilating same?—Subscriber, Pasadena.

The windows should be on a level with the floor so that the chicks may have the extra warmth of the sunshine shining directly through the glass and may have the utmost amount of light on the floor where they must of necessity remain. Watch a brood of chicks crowding against the glass of their brooder as the sun begins to sink and you will realize how unhappy they would be if they could not look out. The size of the brooder stove depends entirely on the number of chicks to be hovered. The bigger the flock the bigger the stove. Any brooder stove catalogue or dealer in poultry equipment will tell you how large a stove you need for the number of chicks you plan to rear in one flock. It is well to remember that the number of chicks a given brooder will care for is apt to be overestimated. Many a brooder which is advertised as large enough for 100 chicks does better work with 50 or 75. Most brooder stoves and heaters are supplied with their own ventilating system. This is the weak point, however, with so many otherwise excellent de-

signs, that the addition of a couple of small windows high up on opposite sides of the house, which can be opened and closed at will, could hardly come amiss. You will do well to put at least one of your windows on pulleys so that it can be raised the middle of the day. Chicks need fresh air just as much as they need heat.—J. A. K.

### Drake or Duck?

Please let me know how I can tell drakes from ducks? Mine are three or four months old.—Subscriber, Strathmore.

It is difficult with most breeds of ducks to distinguish between the sexes before they are mature. A drake is heavier, his voice is deeper and hoarser, and his tail has a more pronounced curl, but these differences are in many cases so slight that they are hardly noticeable even when the birds are full grown.—J. A. K.

## Legal Queries

Louis B. Stanton, attorney, 243 Wilshire Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Los Angeles.

### Windbreak Destroyed

I hired a man to care for and water a windbreak on my ranch. Ran cattle broke the fence and destroyed the windbreak. Can I require the hired man to put up the fence and pay damages for the trees?—Subscriber, Chatsworth.

It would hardly seem from the statement of the case that the man you hired contracted to protect your windbreak and fence from cattle. If he fulfilled his duties of caring for and watering the trees it will seem that that was as far as he was required to go; hence, you would have no redress as against this man. Possibly you might have a cause of action against the owner of the cattle.

### Infringing Patent Right

Does the law require that if an article is patented it shall be so stated on the article? Is one justified in assuming that a new article just received from the factory, bearing a statement of patent or intention of patent, has not been patented? In such case would a person have a right to make it for his own use or sell it to others?—Subscriber, Fellows.

Patentees are required to give notice that their articles are patented by placing a notice to that effect on the articles wherever possible, but if impossible, as in the case of medicines, then upon the article containing them. In the absence of such notice on the article no damage can be collected for infringement unless after actual notice of the existence of the patent the infringer continues to make the article.

### SON OF MINE

Son of mine, as I see you there,  
Engrossed in your book, in your dear armchair,  
Free, as I know, from all worldly care—  
I wonder how long ere the call may be  
That summons you in a trice to be  
Ready to strike for your liberty,  
Son of mine.

Son of mine, I shall have no fear,  
If the call be sounded, that you shall hear  
Your country's voice with an eager ear,  
And shall bravely stand at the first alarm  
Pledging the strength of your strong young arm  
To shield your home and your heart from harm,  
Son of mine.  
—Francis T. Leahy in The Brooklyn Eagle.

# Citrous Ornamentals

Written for California Cultivator By Ernest Braunton

VERY florist and nurseryman in the Eastern states deals in tub or pot plants of ponderosa lemons, Otaheite oranges and other citrous plants. In California trees of this kind are so common that we scarcely consider them as ornamentals. Nothing else so strongly appeals to our first-time visitors. They wish first to pick an orange and then see a palm. Bearing all this in mind it would seem that we overlook what should be a marked characteristic of ornamental grounds. We do grow a few citrous plants of flower value such as *Choisya ternata* but we could employ plants of the genus *Aspidosiphon*, the more ornamental of our species, for example. Then every yard may contain one or more specimens of the better and budded class. Avocadoes, a group or two of guava trees, feijoas, carissas, and other standard evergreen fruit shrubs of acknowledged value as ornamentals. We live in California why not have gardens Californian in tone and color? Why, in such a climate, should we plant cone-bearing trees or deciduous trees, both classes smacking of the north of ice and snow and in general inhospitable rather than inviting. Let us put on figuratively at least a friendly, welcoming front as though we fully realized and appreciated that we live in the land of many opportunities and that we are the world to know it and also to make our pleasures.

## Christmas Flowers

The red floral bracts growing just above and around the yellow flowers of the poinsettia have come to be known as "Christmas Flowers." It is the time to put vigor into these plants. Remember they are natives of Mexico and the needed stimulus is a combination of heat and water. The average garden soil is not enough but in texture it should be light rather than heavy and the drainage should be good. Under such conditions in hot weather poinsettias should have plenty of water; they also need daily spraying to keep foliage free from choking dust. Poinsettias are within the power of every garden owner to have large and attractive heads of scarlet bracts unless Jack Frost catches them first.

## Warm Water

Chilly water is never good for plants either in the soil or on the surface except when plants have been hardened, in which case the colder the water the more slowly will the frost be thawed, with a correspondingly less damage to foliage. All sickly and weakly plants are benefitted, when needing moisture, if the water applied rather warm, and all water at all times and under all circumstances, whether applied to tender plants or to orchard trees, would serve the purpose better if a few degrees warmer than the soil to which it is applied.

## Poultry Manure

On the farm the housewife is generally boss of the garden; also of the poultry yard. Under these conditions it should prove an easy matter to secure the poultry manure for the garden. It is worth three times as much as that from the larger farm animals and is therefore worthy of care. Let it dry and keep it dry unused. It is rich in nitrogen and

poor in phosphorus. It is also in a very concentrated form and if diluted and reinforced a little it becomes ideal for garden use. An acknowledged authority advises adding to every ten pounds of manure ten pounds of other matter, four pounds of which should be acid phosphate. The remaining six pounds should be sawdust or some other dry material. This gives a good balance of the three most necessary elements. Do not mix lime with it at any time.

## Plant More Hibiscus

Where frosts are not severe we cannot grow any flowering shrub of greater attractions than the Chinese hibiscus. No one will deny their claims to beauty for the flowers are large and showy yet not coarse, and the colors are superb. The plants are easily grown, of good foliage and habit, clean and attractive in color. They are particular as to soil or general conditions. But frosts injure them and unless the district is considered fairly free from chilly Jack it is better not to plant hibiscus.

## Monotony in Hydrangeas

For a quarter century we have been growing the beautiful *Hortensia* variety of hydrangea, and no one questions its value as a high class ornamental. But since its introduction many years ago there have been bred many variations of this type; new species and hybrids have been introduced, and thus new forms, colors, etc., may be had. Some of these are superior to the old type, of which we grow so many that somewhat of monotony prevails. Some of the new ones are of dwarf habit and may therefore be planted in situations barred to the larger plants. Inquiry of your dealer will elicit information regarding the new sorts.

## Time for Pansies

It is time now to sow pansy seeds for winter flowers, and one need not spend much money, time or labor in getting a stock of young plants. A single ounce of seeds has been known to produce 50,000 plants. Even dealers buy but one-eighth ounce of high priced seeds and get 5000 plants if good care is given. Put a box of fine sandy soil in a shady place, sow the seeds, merely scratch them into the surface. Water carefully and keep soil damp but never allow to remain soggy. When young plants are large enough to handle, it is better to plant them in boxes, so when they are later planted in the garden a small square of soil may be taken with each plant. This ensures success. Sandy loose soil is best for pansies; coarse, lumpy soil will never do. A light, fine mulch of sifted stable manure will prove a great help if applied to the plant beds.

## Peonies Proving Popular

Peonies are growing in popularity everywhere, largely by reason of the great improvements made in them during the past few years. But in California they are becoming decided favorites whereas a few years ago we grew scarcely any. A deeply stirred soil that is not too heavy and yet is rich in decayed manure (not decaying) is the ideal. We must stir deeply to provide for a moisture holding soil; peonies will not thrive if soil is allowed to dry out. In addition a top mulch of any good material is necessary to keep the soil cool. If these precautions are taken good peonies may be grown, for the best and larg-

est I ever saw grew near Compton, Los Angeles County, during the past year, and they had no special soil or care.

## The Epidermis or Plant Skin

The epidermis of leaves, etc., which corresponds to the animal skin, is just as variable as the latter. In many plants it is tough and leathery; in others thick and corky; in some waxy or oily, and in a few plants contains water holding cells (in the India rubber plant, for example). In cabbage leaves the coating is waxy, doubtless to prevent loss of moisture, but perhaps to also prevent dew or water adhering that would interfere with the stomata or breathing pores. The common nasturtium sheds water from its surface entirely, and even if leaves are immersed in water it comes out with dry surface, and air bubbles from the stomata give the leaves a silvery appearance.

## SWISS CHARD WILL GROW EVEN WHEN WEATHER IS AGAINST IT

Plant some Swiss chard this season. It will grow under unfavorable climatic conditions and the leaves will remain tender throughout the season.

Swiss chard is a form of the beet, the foliage developing more prominently than the roots. The wrinkled leaves may be used as greens or the hard stalks may be cooked and served like asparagus. Chard has as much food value as spinach and tastes much the same. It is more easily prepared for the table, for the leaves are large and easily cleaned.

Cutting off the tops of the plants does not stop the growth. Repeatedly, new leaves will be produced. If a

surplus of chard is grown it may be used as chicken feed as it is relished by the birds.

## VEGETABLE SHOW

We have the premium list of the First National Vegetable Show to be held October 12-20 at Springfield, Massachusetts. This is a gathering of market garden people who will assemble in convention at the time of the show and endeavor to formulate a plan for protecting and advancing the gardening and truck farming interests.

The secretary is Sam W. Severance, Louisville.

## TYING ROPES

The boy who likes to splice and learn all the knots which may be made with rope should see, if possible, "Use of Rope on the Farm," Extension Service Bulletin Vol. XII, No. 5, of the Ohio state university. It is fully illustrated and will teach many a youngster most interesting splices and knots to be made. If postage is enclosed we doubt not the bulletin will be sent to California inquirers. Write the Agricultural College, Ohio State University, Columbus, Ohio.

If I knew you and you knew me—  
If both of us could clearly see,  
And with an inner sight divine  
The meaning of your heart and mine,  
I'm sure that we would differ less  
And clasp our hands in friendliness;  
Our thoughts would pleasantly agree  
If I knew you and you knew me.  
—Exchange.

Work never kills so long as it thrills.

**Saturday, Aug. 25, 1917****OUR ADVERTISERS RELIABLE**

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

**THIS WEEK'S COVER**

Our Arizona contributor, M. E. Bemis, gives on the third page of this issue some most interesting items as to Arizona's methods in educating labor. More of the same information is given in the illustration on the cover page where some of the husky high school boys are shown shouldering their hoes and doing their bit in time of their country's need.

We have remarked that some of our farmers have been restive under the effort to salvage much of real value from the high school boys' desire to have a job on a ranch, and it must be confessed that it sometimes takes much patience to guide these youngsters into ways of creating rather than destroying. We believe the effort is well spent, and we also believe that this year of all years the youngsters have entered into the spirit of the time and have rendered excellent service and, as Mr. Bemis remarks, an asset has been created for another year.

**STATE FAIR**

The state is planning for a great fair. Manufacturers of tractors and all kinds of farming implements and appliances are arranging for big exhibits. Steel and other supplies are hard to secure, but the manufacturers realize that this is a time when fullest preparation on the part of all agricultural interests is required, and they will encourage this by making liberal exhibits at the coming fair. Livestock people say they will exhibit as never before.

We believe it will be a great fair. The Cultivator wants to do its bit, and to that end will give special attention to the fair in its issue of opening date. It expects to give a bit of history of the state fairs in California. There

will be items as to some of the exhibits that will be there; there will be illustrations of some of the stock. The paper will be mailed on Thursday preceding the opening day, which is Saturday, September 8.

We may suggest for the publication and advertising departments that an opportunity seldom equalled is offered to advertisers to reach a larger number of readers than usual as many copies of this issue will be distributed on the fair grounds during fair week, and the Cultivator, as it always has been, will be there in force.

**A COOPERATIVE WINNING**

Another \$1.50 has been added to the farmer's pocket by cooperation. The price made by the sugar factories of California has, through cooperative effort of the sugar beet growers, been advanced to \$6.00 per ton. This on beets testing 15 per cent sugar. Thirty cents is added for each additional one per cent of sugar.

This means a more just price in view of the quotations on sugar and the conditions of the times. Fruit growers, nearly all of whom are members of cooperative organizations, have benefited wonderfully by their united efforts. The alfalfa growers are winning by the use of the same means. Every year sees an extension of cooperative advantages. The bean growers are now organizing, and others are to follow. With sugar beets averaging close to 19 per cent sugar, \$8.20 will be the price to producers.

**JAPS TEACH AMERICANS**

Producers are finding more and more that there is necessity for cooperation. It has been noted that ever since the Japanese people began producing in California they have been cooperating, though not always in a way which was clear to the American producer.

In the recent special cantaloupe edition of the Brawley News congratulations were extended by the secretary of the Japanese Farmers' Association of the Imperial Valley, and referring to this organization and the necessity of standing together, its secretary, Mr. Shiozawa, suggested:

"What one can't singly accomplish can usually be achieved without much difficulty by a group of individuals. Such must be the aim of all organization, be it lucrative or beneficial; if not, it may be asked wherefore was it made."

The best of it is the Japanese cantaloupe growers are accomplishing results by their organizations. About Los Angeles similar conditions prevail, especially are the potato growers thoroughly organized.

**HARVEST TIME**

California was appealed to to give greater harvests than ever for the feeding of a hungry world. Harvest time is now here, and the full measure shows our response. The barley harvest, now practically finished, shows greater acreage and greater tonnage. The harvest is fully up to expectations, and already the plows have been started for next year's grain. Wheat will be planted far more extensively than the present year.

The bean harvest has begun, and as a rule satisfactory crops are being secured. Some fields were caught shy of water at the time of the hot spell; others not carefully planted nor cultivated will yield only indifferent crops; but the total will be enormous and will be needed.

In potatoes the quantity is great; the quality fair. Tuber moth and methods of growers not thoroughly familiar with best cultural practice are responsible for some low grade product. As to the tuber moth, it is no worse than usual and presumably horticultural commissioners will be fairly lenient in permitting sale of infested potatoes where they are for local consumption. Export stuff, however, must be up to standard.

The truck crop harvest is immense; many were induced to plant perishables without proper consideration of market requirements. This has resulted in consumers in the larger towns buying at low prices.

The citrus harvest now lasts for 12 months of the year. The first of November is usually considered the end of the season, but some Valencias will be marketed after that date and a few of the earlier Navel sections will begin harvesting about the same time. The past year's has been the record crop; the shipments to date have practically reached the 50,000 line, which is the top-notch in former years. Another 5000 cars, possibly more, will yet be shipped.

It has been a great year for California; excepting for citrus fruits another year promises to be even greater.

**FARM LOAN BANK**

"The unfortunate entanglement of officers and directors in the culmination of a series of incidents, each small in itself, might easily have been avoided by a little tact on one hand and frankness and forbearance on the other. They were accentuated by unfortunate newspaper publicity, some of which was surreptitiously given, and some unauthorized statements, all of which were inexcusable. They have now reached proportions which, in the judgment of the board, render it impossible for the parties involved to cooperate to the degree necessary for efficient public service which, of course, is the one controlling consideration."

"There being no other alternative, the board is reluctantly compelled to accept the resignations of Directors White, Douglass and Thomas. The resignation of Dr. Mead is accepted for the reasons previously stated. With a fine sense of their responsibility to the public interest, all parties to the controversy, of their free will and without pressure or suggestion of any kind, have tendered their resignations, in order that this board might not be embarrassed by having to differentiate between them."

After making the report in which the above is included, officials of the treasury department which made the investigation announced appointment of A. W. Hendrick of Nevada, who will act as special appraiser; Willard Ellis of Ogden, secretary-treasurer; John Guill, Jr. of Chico; A. C. Kuhn of San Jose; and W. H. Joyce of Los Angeles as members constituting the board. In referring to the appointment some reports have given Mr. Joyce as president and Mr. Kuhn as vice-president; others have exactly reversed the names.

In any case it is to be hoped that a harmonious working board is in the saddle, and while California is bitterly disappointed that Dr. Mead has retired from this work, the needs of agriculture demand fullest support of this institution. Disappointed applicants for loans should bear with the new board until it has time to get possession of all the details of the business, when we believe applications now being made will quickly be

disposed of. It must be borne in mind that this institution is travelling absolutely new road. This account in part for the rocks which have set some of our calculations.

Applications for loans in this tract have been more numerous than in any other, and this, of course, complicated the situation. Hoping for the complete success of the new management.

**Agricultural News Notes**

Ordinarily Michigan is the bean producing state; this year California is expected to go to first place.

The sugar crop of Hawaii for 1917 is estimated at over \$79,000,000 value. Last year it was valued \$68,000,000.

It is now estimated that the United States will produce this year about 19,000,000 bushels of rice as compared with about 9,000,000 last year.

Machinery has been introduced to the Hawaiian Islands for the manufacture of bags from the fiber in nana plants. The bags will be used as containers for raw sugar.

New Zealand is a great exporter of dairy supplies, the exports last year amounting to 39,847,000 pounds. The shipment was slightly under that of the preceding year, but returns of producers were greater.

New Zealand's wool sales during nine months aggregated 446,000 bales. This was more than 100,000 bales greater than the preceding year. Shipping facilities being light, a little of this stock has gone forward.

Most of the coffee raised in the Hawaiian Islands is shipped to the Philippines. To increase profits the coffee land soy beans and other vegetables are raised between rows of coffee plants, especially when plants are young.

Tasmania is investigating possibilities of shipping apples into New York City. Her harvest time is March, April and May. Tasmanian apples are said to be of excellent flavor and shipments to London have usually been successful.

The government of Italy has established rules governing agriculture which specify often to smallest details methods of work, especially contracts between landlord and tenant. Even methods of using implements and tools are given.

The appeal to the shippers to aid the campaign to lessen car shortage was responded to so liberally that the car shortage on August 1 was one-fourth of what it was on May 1. The railroads are promising to push even car to its limit.

Three large cooperative organizations operating elevators in Saskatchewan, Manitoba and Alberta have over 48,000 share holders and their assets are in excess of \$8,000,000. Last year they handled 90,000,000 bushels of grain.

The soy bean is one of the principal products of Manchuria, the annual production running between 1,500,000 and 2,000,000 tons. The production is increasing rapidly. A new factor affecting production of soy beans is the growth of the new sugar beet industry.

With all the rest of marking up of food products now comes the announcement from Japan that lack of shipping facilities brought about by the war prevents moving of the great tea crop and, local supplies being shortened, six, seven or eight cents per pound is to be added at once.

# Agricultural News Notes of the Pacific Coast

## Northern California

Lake County's crop of pears will be its largest.

Contra Costa County has 2000 acres of almonds in bearing.

Humboldt County's fair at Ferndale begins Tuesday, August 21.

Almond harvest is progressing in all of the producing sections.

"Hop Pickers Wanted" ads are still running in the Northern papers.

It is estimated that California will produce 5,000,000 bushels of rice this year.

The Vintage Festival at St. Helena is to be held August 31 to September 3.

Wild ducks are causing immense damage in many rice fields of Butte County.

Sheep breeders report larger demand for pure breds than any preceding season.

Two salmon packing plants have been erected at Fort Bragg, Mendocino County.

Rice growers are concerned as to securing sufficient storage for this year's big crop.

The commerce on the San Joaquin river in 1916 aggregated 824,223 tons, which was valued at \$42,179,160.

The directors of the state fair are endeavoring to secure a big exhibit for the coming fair September 8-15.

Hops have passed the 30 cent a pound mark, and some large growers predict 40 cents will yet be reached.

The Humboldt County Fair is being held this week at Ferndale. Prof. Abel is judging the livestock classes.

Paradise, Butte County, has harvested the biggest and most satisfactory berry crop ever grown in that section.

A landowner in Butte County is suing a water company because of damage from seepage of waters from irrigation canal.

Many Lassen County pastures have been ravaged by grasshoppers so that livestock men have been compelled to seek other pastures.

Experts of the soil survey department of the United States department of agriculture are making investigations in Nevada County.

The newly organized Pear Growers' Association contemplates the erection of a cooperative cannery unless buyers make a more satisfactory offer.

Articles of incorporation of the California Pear Growers' Association have been filed and the eleven directors have been empowered to effect a permanent organization.

The Nevada County Cannery at Grass Valley is running on beans. The cannery runs on beans, pears and peaches and is paying \$40 per ton for pears, \$40 for best quality peaches and \$60 for beans.

The farm adviser's schedule calls for meetings in Alameda County at Livingston, August 20; Niles, 22; Alameda, 24, and Oakland, 27. The county director's meeting will be at Hayward, August 25.

Land owners in reclamation district 833 in Butte County are refusing to pay assessments "until it has been established that said district is in all respects a valid and legal district and that all the proceedings connected herewith are likewise valid and legal."

## Central California

The cannery at Oakdale, Stanislaus County, is running on peas and beans.

Red spider has made serious inroads on bean crops of the Turlock section.

The Commercial Club of Fresno is aiding in the fruit harvesting labor problem.

The boys agricultural club pig growing contest ended at Kerman, Fresno County, last week.

Stanislaus County reports its harvest of grain ended, the Oakdale section alone producing over 20,000 tons.

The farms of the Oakdale irrigation district will produce at least 500 per cent more than in any preceding year.

Arrests have been made at Terra Bella, Tulare County, because of father and son stealing 18 bags of wheat.

There have been several disastrous fires in Fresno County, nearly all of which are known to be of incendiary origin.

This week, August 13-18, is squirrel week in Tulare County. Horticultural Commissioner Collins has charge of the campaign.

The fruit handling division of the United States department of agriculture recently held a "melon handling exhibit" at Turlock.

The Stanislaus County Swine Breeders will make an association exhibit at the Stanislaus county fair at Modesto, September 17-22.

The district fair to be held at Fresno the last week in September is planning to give special attention to exhibits by boys agricultural clubs.

Souvenir packages of Fresno County's raisins were distributed at the recent International Typographical Union convention at Colorado Springs.

Vineyardists of the central San Joaquin Valley district are urged to abide by the wage scale recently adopted by the Valley Fruit Growers' Association.

The section south of Kerman, Fresno County, is planting extensively to sweet clover and finds that if cut young this clover makes excellent hay and is good pasture.

Wheat buyers at various points in the valley have not been anxious to buy at present wheat prices. Fear of government prices permitting of no increase is given as the cause.

The preserving company at Modesto will can 4,000,000 cans of fruit, nearly double the output of last year. At the present time the cannery is running about 65,000 cans daily.

San Jose Grange Patrons of Husbandry has requested that no farm adviser be secured for that county, but that the work be placed in the hands of County Horticulturist Earl Morris.

Kings County will observe the last three days of August as squirrel poisoning days. Every resident of the county is urged to aid in this wholesale raid. Squirrel meetings are being held in all sections.

Two new dairy laws became effective August 1. The Rose law, providing that cream must be cooled within one hour after milking, and the Satterwaite bill, providing that all butter, ice cream and other dairy products except cheese must be manufactured from milk of tuberculosis-free cows or from milk that has been pasteurized.

## Southern California

Citrus orchards are being fumigated for black and citricola scale.

El Cajon, San Diego County, is discussing the matter of good roads bonds.

The Los Angeles County council of defense is endeavoring to cut consumers prices of fish.

Fumigation cost has been increased about one cent per tree because of higher price of cyanide.

The state will spend \$750,000 in highway improvement in the Imperial Valley during the next year.

California fruit is being shipped from Pomona, Hemet and Kingsburg to the English army in Egypt.

Lima bean growers of Ventura County have decided not to press further sale of this season's crop.

Palmdale, Antelope Valley, grew in 1916 about two acres of beans; this year's crop will be harvested from 2000 acres.

Imperial Valley farmers have contracted their "corn" crop at \$60 per ton. Offers for fall delivery are \$35, however.

Various citrus growers' associations will be holding their annual meetings during the first two weeks of September.

Lima bean growers of Ventura County are taking steps to save all the bean straw which will command a long price this year.

The Southern California Automobile Club has placed over 17,000 signs along the highways of the southern part of the state.

The recently enacted food bill will make provision for new farm advisers, and it is estimated a dozen will be appointed in the near future.

The Imperial Valley cotton growers are urged to sign up with the county council of defense for the number of hands required in the cotton harvest.

The California Development Board will meet at San Luis Obispo September 7 and 8 and discuss labor and other questions of interest to farmers.

Pomona recently shipped four carloads of apricot pits to Santa Clara where their oil is extracted. Germany was formerly the market for these pits.

Beet growers are demanding an increase in price of sugar beets, for with increased labor and all other costs they cannot be produced at present prices.

The war department is asking for bids on nearly 2,000,000 pounds of Irish potatoes and 500,000 pounds of onions for Camp Kearney, San Diego County.

Yucaipa's Southern California Apple Show is to be bigger and grander than any preceding year. The valley will have an output this year of 125,000 boxes.

The state highway commission is investigating "The Rim of the World" in the San Bernardino Mountains. It is hoped that the commission will improve this wonderful highway.

The Prune and Apricot Growers' Association has appointed C. G. Hamilton supervisor of receiving and packing dried fruits taken into the Southern California warehouses. Mr. Hamilton will oversee the work at Hemet, Santa Paula, Santa Ana and Banning.

## The Coast

Walla Walla, Washington, will ship 400 cars of onions.

Arizona short staple cotton has sold as high as 24¼ cents.

Maricopa County, Arizona, has 137,679 acres planted to alfalfa.

One bunch of Oregon wool clip was sold at Shaniko at 60¼ cents.

Arizona cantaloupe fields averaged from 200 to 224 crates per acre.

A million bushel grain elevator is to be erected at St. Johns, Oregon.

Linne County, Oregon reports about 50 per cent of last year's apple crop.

Oregon reports about ten per cent increase in crops this year over those of 1916.

The University of Arizona is appealing for more warehouses for storing this season's big crops.

Jefferson County, Washington, is making extensive experiments in the growing of Indian corn.

The good roads advocates of the state of Washington are urging plans for a 3000 mile concrete state highway.

Cotton growers at Chandler, Arizona, are assured that they will have sufficient labor to handle the coming crop.

Sales of several carloads of hogs have been made at the Portland stockyards at between \$16 and \$17 per hundred.

Oregon cow testing associations report severe falling off of all cows during the latter part of July because of short pastures.

This season's output of the cantaloupe crop of the Salt River Valley, Arizona, amounted to nearly 1300 cars of 325 crates each.

One ranch near Chandler, Arizona, is maintaining a cannery of its own. Some especially fine peaches are being packed under their own brand.

The state college of Washington recently managed a sale at which there were sold over 1000 registered rams and nearly 2000 pure bred and range ewes.

The Farmers' Union Grain Agency at Pendleton, Oregon, controls its own large elevator, and on its total investment has declared a dividend of ten per cent.

Livestock men of the Northwest have charged that the movement which aims to stop the marketing of young meat is a boycott against the livestock interests.

The first offering of this season's barley grain at Walla Walla, Washington, commanded \$35 per ton. The average production per acre in that section is 70 bushels.

Farmers of Sulphur Springs Valley, Arizona, have organized a cooperative oil company which is buying sufficient oil to run plants of all the farmers for a year to come.

The wheat yield of Western Saskatchewan, Canada, will be greatly reduced by excessive heat during the latter part of July, the thermometer registering from 95 to 100 degrees Fahrenheit for 18 days.

Montana farmers have had a bad year. The winter was long and severe, the spring backward, and the usual June rains did not come. July has been hot and dry. A letter from White Sulphur Springs states that there will not be enough grain raised in that valley to feed the chickens.

## A Strange Belief About Forest Fires

**A**N odd belief is widespread through the mountainous regions of California in the benefit and value of forest fires. The essence of this belief, known as "light burning," is that a fire spreading along the ground in the forest does no damage to the timber, but removes the litter and underbrush which, if allowed to accumulate, becomes fuel for a fire that in time will consume the mature timber. Therefore, in the opinion of those holding this theory, occasional fires in a forest are beneficial and necessary. The Indians and early settlers, it is said, always "light burned" the forests in order to make feed for the deer and the cattle and to clear the brush out of the way, and these fires did the forest no harm, but, on the other hand, did a great deal of good.

This theory, declare the experts of the forest service, although a somewhat plausible one on its face, is entirely fallacious as light burning does immense harm. The damage done to the young growth is severe. Fifty per cent of the trees between ten and 15 feet high are usually killed by a fire running through the forest. Nor is any permanent protection given by the removal of the litter on the ground by fire, for within a few months it accumulates thicker than ever from the immense amount of foliage and young stuff killed but not consumed by the light fire. This material begins to fall soon after the light fire, and in a year or two is often more plentiful than ever before.

A few years ago the forest service experimented with "light burning" on an 80-acre tract in Shasta County near Castle Rock. The tract, which had not been touched by fire for 14 years, consisted of dense thickets of

young trees, mature timber, patches of brush and grass. Fire was allowed to run uncontrolled over it. Part of the litter was consumed and much brush was killed but not burned. Sixty per cent of the young trees between ten and 15 feet high were killed. Six months later the litter on the ground was just as plentiful as it had been at the time of the fire. Two and a half years after the experiment the needles and leaves on the ground were 50 per cent more than at the time of the burn. It was estimated that the risk of fire in this tract had been increased at least 50 per cent in less than three years.

This erroneous theory has not been entirely confined to mountaineers. A year or two ago the officials of a Sierra power company, it is said, thinking to decrease the fire hazard along the right of way of a large lumber flume, caused to be set controlled fires. A year or two later an accidental fire spread to this right of way, and so great was the accumulation of the needles and debris, the fruit of the light burn, that this accidental fire could not be controlled. It wiped out several hundred feet of flume, causing a great loss to the company.

It would have been much better for the forests of California, declare the forest experts, if the Indians and early settlers had not set the fires they are credited with setting. As a result of fire, there is not a forest in California that contains as many mature trees as the ground is capable of supporting. Of the 1,300,000 acres of land covered with brush in the national forests of California, a million acres at one time supported dense stands of mature timber. There is evidence at hand that 25 billion feet of mature timber have been destroyed

by fire in California, enough to run all the mills of the state for 25 years. There is one region in the Squaw Creek country in Shasta County of 150,000 acres that in the sixties was heavily forested. Today it is chiefly a chaparral desert due to a fire in the seventies. Another fire in this same region on the southeast slope of Mt.

Shasta near McCloud destroyed 10,000 acres of yellow pine and sugar pine in the seventies. The timber has never returned. Chaparral has taken its place. Undoubtedly, declare the forest officers, this belief in the value of light burning has been responsible for a loss of millions of dollars to California.

## Hemp in the Imperial

**A** NEW crop with which much of promise for the Imperial Valley, and perhaps other sections of the state, has been tested in the Imperial Valley, 200 acres of hemp having been grown this season. The illustration

tucky the average growth is about six feet. A few weeks ago an experimental cutting was made and the fibre sent East where it was made into yarn which was pronounced to be of fine quality. One thing in favor of the hemp industry in the Imperial

Imperial Grown Hemp

On the Timken ranch. One of the finest productions of hemp yet grown. C. O. Bullis manager of the ranch is shown in the picture.

below was taken by A. M. Nelson of the Imperial Valley and shows the husky growth taken on. Investigations have been made by General Freight Agent Clapp of the Southern Pacific, and he says:

"This is the first year's planting and it is a little early yet to determine the production per acre and the quality of the hemp itself, because harvesting has just commenced, but there is every indication that the production per acre will be heavy and that the hemp is of A-1 quality. It is said to surpass any hemp grown in Kentucky; it reaches a higher stand, approximately 11 feet, while in Ken-

Valley is that the crop comes in ahead of the frost, which means that it will not be discolored.

"A decorticating machine has been invented by George W. Schlicten which is said to be a success; it has already been tried on both hemp and cotton stalks. If this machine in practice runs true to the experiments that have been conducted it will be a boon both to the hemp industry and in utilizing the cotton stalks because the fibre from both can be separated much more economically than by hand, and it would not be surprising if the hemp planting next year in the valley amounted to 10,000 acres."

## To Arm the Farmer

**I**N the Implement and Tractor Trade Journal we find some sensible advice on arming the farmer:

Unless the farmers can have their tools the country can't have its food. That is what is worrying the farm operating equipment industry.

Steps have been taken by the National Implement and Vehicle Association to gain government aid in heading off the danger. The council of national defense, and others in authority at Washington, however, are so busy with the problems of training and munitioning troops that they are overlooking the needs of the farmer.

When Russia first entered the war the officials at once set every large

factory to work making munitions. This ukase that went out from Petrograd affected all the plants making farm machinery. They had to drop that and get into the feverish production of "war goods."

### How Russia Blundered

But it wasn't long until the Russian government realized its mistake. Although in desperate need of all sorts of military supplies it began to see that no national progress could be made without improved farm machinery.

As soon as the tools of the farmers began to wear out and they could buy nothing new to replace them, the country felt that empty feeling in the region of the stomach. So orders were issued to set the farm machin-

ery plants back to making farm machinery again. They have been at it ever since.

### Must Have Farm Tools

It is this blunder that the farm operating equipment industry of America fears may be repeated on a vastly enlarged scale in this country. Even before the United States entered the war, steel was so high and hard to get that the implement factories were desperate. Now that America is one of the Allies the situation, from the viewpoint of the farm im-

plement makers, is anything but improved.

Farmers throughout the country are beginning to see that their supply of tools is threatened. They fail to understand how they can respond to the cry for greater crop production without implements, even if they do have to pay more for them just as the miller pays more for his wheat. They are perfectly willing to help win the war, as they have been besought to do from so many quarters, but they must have tools. It is the particular mission of the implement makers to "arm the farmer."

ALIFORNIA has developed its rice industry from 1200 acres in 1912 to 100,000 acres in 1917. Climatic and soil conditions are different

from other localities in the United States where rice is grown, which makes it necessary to develop new varieties. In California it is essential to have an early maturing variety that will yield well and give good milling results.

The government rice experiment station at Biggs, in cooperation with the Sacramento Valley Grain Association, Inc., has tested more than 1200 distinct varieties, besides many selections and hybrids. As a result of this work during the past five years several new varieties have been developed. One of these is known as No. 1564 and has been increased from a single head in 1912 to a quantity sufficient to seed over 8000 acres this year. It is about 15 days earlier than the leading commercial variety now grown, the yield is as heavy, if not heavier, and the milling yields and cooking qualities are superior. With this new early maturing variety the rice grower is practically assured of getting his crop harvested and thrashed before the fall rains commence, which factor greatly reduces the element of chance.

The seed of this new variety was increased last year by several farmers under general supervision of the government rice station and the Sacramento Valley Grain Association. The Association purchased all of the seed from the growers in accordance with their agreement, in order that the

distribution and allotments to the rice growers would be made without partiality and at a reasonable price for the seed. The association allotted seed sufficient to seed about 8000 acres this spring.

Milling tests have been made by the Pacific Rice Milling Company of Biggs, Phillips Rice Milling Company of Sacramento, and C. E. Grosjean Rice Milling Company of San Francisco. All of these tests have shown that the rice has exceptionally good milling qualities. From the results of extensive culinary tests conducted by the department of agriculture, it has been shown that this new rice is one of the very best cooking rices grown in the United States. — The Great West.

### CALL FOR FOURTH ENTRY 1917

The fourth entry of butter and cheese for the 1917 Educational Scoring Contest will be due Friday, September 7, 1917. Entries should be at State Fair Grounds, Sacramento, not later than that date.

Entries will be eligible to compete for the state fair prizes. The State Agricultural Society is giving \$874 to be distributed as special prizes and prorated for dairy products scoring 90 or above. If you do not receive a premium list write Secretary of the State Agricultural Society.

Prof. H. S. Baird of the division of dairy industry, University of California, is in charge of the contest.

We agree that life is a problem. Let's make it one in addition, not subtraction. It is the "sum" of all the days that we want, not the "remainder or difference."

Blasting Out the Stumps

Explosives are effective and economical in removing stumps, boulders and other obstacles to more and better farming. This shows method of boring under stump to place charge of dynamite.

# I Say "Don't Buy This Tractor or Any Other Until You Get This Book"

It tells all about the most wonderful little Tracklaying Tractor ever built for Orchard and Vineyard work. Write me direct today, or send the "Tractor Opportunity" coupon. Lowest prices now.

My name is W. B. Raymond and I am the man in this concern whose job is to get the story of the wonderful little Bean TrackPULL Tractor before orchardists and vineyardists. And I say "Don't buy this tractor or any other until you get the TrackPULL story, because that story may revolutionize your tractor ideas to your great benefit.

"There are some things that the TrackPULL won't do and you want to know those things before you buy a Bean TrackPULL—and there are other things it will do that other tractors can't do, and those things are vitally important, particularly to vineyardists and orchardists.

"The front drive principle—steering with the track that PULLS—is just one of the features of this great little tractor

that is patented. No other tractor is like it. A patent, of course, always means a big advantage.

"Look at the illustration. The Bean—6 h. p. at the draw bar—pulls instead of pushes itself over the ground and you steer with the track that pulls. That means you can do everything with the Bean that you do with horses plus a lot of things horses and other tractors never have done—like going under tree-boughs only four feet off the ground and pulling full load on turns. The Bean works between seven-foot rows in vineyard—that's another advantage.

"But I couldn't begin to show you in an ad all the advantages. They've got to go into a book, and you ought to have that book before you buy a tractor because it will save you money."

## BEAN TrackPULL Tractor

PATENTED FRONT DRIVE—NO OTHER LIKE IT

### "Tractor Opportunity" Coupon Mail It to Me NOW

Send me the coupon below and I'll send you the book free. Read about the "Fifteen Features of the Bean." The price is \$1150.00 now—the lowest priced track-laying type of tractor built—but material costs are steadily going up, so I suggest you act quickly before a raise. There's a real tractor opportunity in this low price.—W. B. R.

## Who's Who

Written for California Cultivator By F. F. Stonerod

With the issue of August 11 the Cultivator started its series of "Who's Who" articles to bring before its readers some of the livestock producers of California who are responsible for the large development of the industry. Where did they come from and how long have they been engaged in California development, also how do they look, so pencil and camera are to be used, and some homely, everyday photographs and notes regarding them will bring us closer together. Bear in mind we say "homely photographs" and not photographs of homely people. The idea we wish to convey is that so far as possible we will secure photographs in everyday surroundings at the homes of the livestock producers.

Other sketches and portraits will appear in the next and following weeks.

**T**O the livestock men of this state D. J. Stollery needs no introduction. We should qualify that statement a bit perhaps by saying beef cattle and horse men, as it is in these two branches of the industry that he has been actively engaged for a number of years.

Mr. Stollery was born in London, England. He graduated from Ion House School, Hampton Court, and then decided that the little Isle was not big enough for his activities so he wrote to an old college chum who had a big herd of registered Shorthorn cattle in western Canada that he would accept his invitation to pay him a visit and see for himself what a great place Canada was. That was in 1902. He assumed charge of one of Manitoba's biggest farms for two years after he got nicely settled.

About this time an opportunity to come to California presented itself so he resigned his position in Manitoba and entered the real estate business in San Francisco. Always a keen sportsman and fond of country life Mr. Stollery became an active member of most of the exclusive Peninsula clubs, not the least of which was the San Mateo Polo Club of which he has been secretary for many years. Through business and social relations Mr. Stollery became associated with Wm. D. M. Howard, the man who imported the first herd of pure bred Shorthorn cattle into California in 1857. At Mr. Howard's untimely death in 1915 Mr. Stollery was the sole director of the corporation who held out for retaining the Shorthorn herd intact. As administrator of the estate he showed rare ability and judgment. The Shorthorns became

the property of A. K. Macomber, San Francisco millionaire, and were moved to the Paicines Rancho in San Benito County, and Mr. Stollery assumed full charge for the new owner, which position he filled in an able manner until recently when he was forced to relinquish full charge, due to multiplicity of business interests. However, he is still associated with the Paicines people as sales manager. Mr. Stollery maintains offices in San Francisco, making periodical trips to Paicines.

There is not a finer herd of Shorthorn cattle in the world, everything considered, than this same Paicines herd as it carries the blood of animals with world wide reputations and is maintained at high standard by frequent additions of the best bulls obtainable. Looking after the details of a herd numbering well over 700 head of registered animals is a man sized job, and this man not only fills it acceptably but finds time to look after numerous other duties.

He is secretary of the California Shorthorn Breeders' Association, and the members showed great foresight in selecting this capable young Englishman for the position. He is a

live wire and gets results, and is extremely popular with everybody. His enthusiasm over Shorthorn affairs is unbounded, and as long as he is secretary of the association it will expand and be a power for good.

Mr. Stollery is a young man of

David J. Stollery

pleasant manner, is easily approached, likes to ride, and knows a good Shorthorn when he sees one. He knows how to sell them too, which is due partly to his training and partly to natural ability.

## Hoof Trimming Crate for Hogs

Written for California Cultivator By J. I. Thompson

**I**T is somewhat annoying and generally quite difficult to properly trim hogs' feet. The herd boar may be gentle enough so that his feet may be properly leveled and his toes shortened while he is lying down, but many hogs being fitted for show do not submit so readily to this operation. It is quite exasperating to have trimmed three feet and, in your anxiety to get them as short as pos-

as an ordinary shipping crate. It may be any length, but should preferably be from five feet to six feet long. The height can be about three feet. The width should be 24 inches on the outside. A drop board is provided at each end so that the hogs can walk out instead of back out. The bottom needs chief consideration. It is made of three two-by-fours laid flat, one running along each side and the other directly through the middle,

sible, have pricked the sensitive part of the foot just enough to jog the hog's memory permanently, so that he immediately gets up and walks away whenever an attempt is made to finish the job.

Due to just such experiences as these, herdsman Jack Finlay and the writer worked out the plans for a crate herein illustrated and described.

The general plan is much the same

leaving a space of six inches on each side and the other directly through the middle, leaving a space of six inches on each side of the center two-by-four. Running from the inner edge of the outside two-by-fours up to the side of the crate is a piece of one-inch-by-eight inch. This makes a sort of V-shaped trough out of the bottom of the crate, and it is these sloping sides which carry much of the hog's

weight. The rest of the weight is carried by the center two-by-four which is well padded with old sacks. A piece of strap iron is run across the bottom and up the sides at each end of the crate, on the top of which iron rings are placed. A rope is run through these four rings and attached to a block and tackle by which the crate and hog are lifted high enough from the floor so that the feet can be easily reached. We have used this crate for various sized hogs from 150 pounds up to 800 pounds and find it entirely satisfactory. We often remove the front drop and trim the ears and head. The hogs seem to be entirely helpless but contented when hoisted up in this manner, for they do not struggle at all and apparently take a nap while being manicured.

## CARNATION STOCK FARMS AUCTION SALE

This sale will consist of approximately 150 head of registered Holstein females and males. Approximately 75 females and 10 males will be offered by the Carnation Stock Farms. The females are all good individuals and practically all of them are bred to the herd sires, Johanna McKinley Segis, King Segis 10th, Matador Segis Walker, Dutchland Governor Sir Colantha. The first three of these bulls are well known to Holstein breeders, because they are direct descendants of the famous King Segis family. Johanna McKinley Segis and King Segis 10th are half brothers, while Matador Segis Walker is a son of King Segis 10th and a very splendid individual, who is rapidly proving his transmitting ability. Dutchland Governor Sir Colantha has proven his right to be claimed as a son of Colantha Johanna Lad by having a daughter who is a world's record junior two year old—Von Heim Winnifred Colantha, producing 117.81 pounds butter in 30 days.

Among the ten young bulls offered, Korndyke Rag Apple Milla, 163749, is a son of the famous Rag Apple Korndyke 8th, and carries 75 per cent of the same blood as the bull that sold for \$20,000 at the Detroit sale in June, 1915. The dam of this young bull is a daughter of the great Pontiac Korndyke. This double fusion of Pontiac Korndyke and world's record blood will surely produce excellent results when the daughters of Korndyke Rag Apple Milla freshen. Others are sons of McKinley, the senior herd sire and son of the famous King Segis and the 40 pound cow, Johanna De Kol Van Beers.

The health of all animals offered by Carnation Stock Farms at this sale is guaranteed by certificate of health issued by the United States bureau of animal industry.

This will be the first sale held in the new Carnation Stock Farms sales pavilion at Kent. John L. Smith, owner of the Hazelwood Farm of Spokane, Washington, will offer about 75 head at this sale, among which will be the prize winners or the descendants of Mr. Smith's prize winners at many stock shows. Sale will be held on Wednesday and Thursday, October 3 and 4. Catalogues and other information will be given out at a later date.

## ANTELOPE VALLEY FAIR

The Antelope Valley Fair will be held in Lancaster September 26, 27, 28 and 29 inclusive. The fair buildings have all been erected and the road to the fair grounds has been well prepared for the occasion. The management especially wishes to make this a live stock exhibit and wants exhibition of stock from outside points if possible.

Purebred Registered  
**HOLSTEIN CATTLE**

Enthusiastic Holstein Clubs, county, district and state, have been organized all over the country, and they are making wonderful progress in establishing testing associations, and in cooperative effort in eradicating disease among their animals. They inspire in their members a high standard of dealing, and in many ways accomplish the maximum of good for all breeders of Holsteins in their localities. There's big money in the big "Black and White" Holsteins.

Send for FREE Illustrated Descriptive Booklets The Holstein-Friesian Association of America, F. L. Houghton, Sec'y, Box 120, Brattleboro, Vt.

## Finely Bred Holstein Bulls

from dams of the best blood lines. They are well developed, of splendid individuality and type. Our place is within one mile of the city, so they are easy to see.

Rossmead Farm

## POLAND-CHINAS

Won second on boar and sow P.P.I.E. 1915. Champion sow at Fresno and Hanford 1916. Young stock of this breeding for sale.

F. D. ROSS

Hanford, Cal.

## Breed Leaders

Every breed of live stock has its outstanding character the same as the human kind. A great dairy cow has proved her ability to produce anywhere up to 15 tons of milk annually; the trotting horse has secured his record around two minutes; the beefmaker has shown his ability to make the least amount of feed into the greatest amount of food; swine, sheep and others of the live stock family have shown themselves great characters. In addition—and here is where their worth is proven—these animals can transmit their productive power to their offspring.

Beginning with the issue of August 4 the Cultivator gave an account of Pieterje Bloom of the university farm dairy herd. Some things she has done and more that her daughters have done were chronicled. She was a most worthy leader in this series of articles. Others of her kind follow. More of the "handsome is as handsome does" type of animals will be given in the columns of the Cultivator during the next few months.

### ESCALON FASHION PRINCESS

Written for California Cultivator

**S**HE is one of the best animals we ever bred," said A. B. Humphrey.

When the American Berkshire Association announced that a \$50 silver trophy would be awarded to the best animal bred by consignor, sold in the Western Berkshire Congress sale at Davis in February 1917, Charlie Maurer asked Mr. Humphrey "Do you want to win

neck is short and evenly blended into a shoulder that is neat and very smooth. She is perfectly filled out in the heart girth and has a wide chest. Her back is wide and well arched, her ribs well sprung and the loin well covered. The width of the body is well carried out to the rumps and the tail setting is high. She has plenty of bone and stands up well on her feet—in short she is a very symmetrical, beautiful sow.

Her sire is Fashion Longfellow 5th, 199110, who is from Fashion Long-

A Champion in Good Company

Champion Berkshire sow, Escalon Fashion Princess 224400 shown at Chico 1917 fair. She was exhibited by Butte City Ranch. The connoisseurs behind her are W. P. Dwyer and sons, Chas. Leonard, Wm. Sproule, Pres. S. P. R. R., Maj. A. L. Nichols, Robert Durham.

that?" To which Mr. Humphrey replied "Sure, I do." "Well, Princess can do it," said Charlie. And she did.

She was bought by Harry C. Moore, president of the Pitman-Moore company of Indianapolis for \$500, the top of the sale. Being well along in pig to the service of Grand Leader 2d, she was sent up to Butte City Ranch to farrow before shipping her East. She was such a favorite there that Mr. Moore was persuaded to sell her. It is a long trip to Indianapolis by express, and a valuable animal might be lost or injured en route.

She farrowed seven fine pigs March 5, 1917. These were weaned and she was shown at the Butte County Spring Exposition at Chico, winning grand championship in very strong company.

Escalon Fashion Princess is an exceptional individual. She has a perfect head, short and broad, with a very intelligent countenance. Her

fellow, 179729 and Premier's Bernice Lass 2nd, 151210. Her dam is Star Princess 16th, 182554, who is from Superior Star, 145224, and Mayhew's Princess, 135579.

Fashion Longfellow 5th was one of the good breeding boars of the Humphrey herd, as was his sire, Fashion Longfellow sired by Premier Longfellow, the grand champion at the St. Louis World's Fair.

Star Princess 16th is by Superior Star. Star Leader, the reserve grand champion boar at San Francisco—recently sold to Anchorage Farm for \$1500—is out of a Superior Star sow.

Mayhew's Princess is by Prince of Perkins 3d, of a family that has produced many good ones in California.

Premiers Bernice Lass 2d represents the Bernice family, highly prized at Grape Wild Farms.

Escalon Fashion Princess is one of the animals in the Butte City Ranch herd that is not for sale. She is the kind of a producing individual that helps to make any herd famous.

## Field Notes from the Live Stock Men

H. M. Barngrover of San Jose formerly with the Anderson-Barngrover Manufacturing Company, has an 800 acre stock farm in the Indian Valley, Plumas County, on which he has 60 pure bred Herefords headed by California Prince 2nd, one of the choice sons of Prince Lad 11th, bred at our state farm at Davis. Plumas County is 3500 feet in altitude, a rich grass and hay section well calculated to produce cattle with plenty of vigor and stamina. Claude Peter and L. Z. Smith both have Hereford herds in the same county.

The Second Annual Ram Sale under the direction of the National Wool Growers' Association will be held at Salt Lake City, Utah, next week, August 28-30.

Anchorage Farms, Orland, has purchased three fine Berkshire brood sows from Thatcher, Ennis and Wil-

liamson; Rookwood Lady 96th, Rookwood Lady 97th and May Belle of U. F. 4th.

Homer Hewins, Jr., manager of the Maplewoode Ranch of Calistoga, reports the sale of young Holstein bulls to A. L. Tubbs Company, Calistoga, and the Good Templars Home of Vallejo.

F. M. Johnson has sold recently, bred sow and boar to Phillip Duffy, Napa; three gilts and a boar to D. Fricot, Angels Camp.

H. P. Eakle, Jr., reports recent sales to Gallinas Land & Stock Company, Gallinas; three sows to Mrs. R. L. Estes, Sacramento; five sows to A. L. Cohen, Sacramento; one boar to F. E. McCune, Cranmore.

Guy H. Miller has recently sold two young Jersey bulls. The buyers are Sinsheimer Brothers, San Luis Obispo, and Wallace J. Sinclair of Fairmead.

## Closing Out Sale of Live Stock at a Bargain

An Opportunity to Secure a Choice Lot of Young Holstein Heifers Sired by Registered Bulls from Full Blood Unregistered Dams.

30 Head of 15 to 18 months old Holstein heifers now being bred to Registered Holstein Bull.

4 Head of Grade heifers.

7 Head grade four and five year old cows.

1 Registered two year old Holstein Bull, Segis Paul Pontiac de Kol Burke.

1 Two year old Guernsey Bull, sired by May King of Fern Ridge, a bull that took third at the San Francisco Exhibition in 1915, Dam Imported Lady of the Forgettes.

Wish to sell in single lot and will make special price, on the above stock.

ALSO a choice lot of brood mares, Jacks and Jennets at a bargain price.

### El Cerrito Rancho Company

CORONA

CALIFORNIA

### Santa Anita Rancho

Anoakia Breeding Farm

**ARABIAN THOROUGHBREDS:** Two-year-olds, sired by imported Stallion Ibn Mahru, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

**SADDLE HORSES:** Some of which were sired by Ibn Mahru, world renowned imported stallion. These horses are mostly three-year-olds.

**POLAND-CHINA AND BERKSHIRE BOARS:** Four to nine months old. Sired by famous Poland-China hard boars, Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

**HOLSTEINS:** We will sell a number of young bulls. Some sons and grandsons of the noted Prince Gelsche Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

## CUTTER'S BLACKLEG PILLS

"California's Favorite"  
for nearly 20 years

For the Prevention of Blackleg  
in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock.

Use any Injector, but Cutter's simplest and strongest.

### Prices:

10 dose pkg. Single pills \$1.00  
50 dose pkg. Single pills 4.00  
10 dose pkg. Double Pills 1.50  
50 dose pkg. Double Pills 6.00  
Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

The Cutter Laboratory, Berkeley, Calif.

The Cutter Laboratory of Illinois, Chicago  
Eastern Agent

## Better Than Whitewash

"We did not have to go to town for lime, wait for it to slack or strain it. We just mixed the Carbola with cold water. In less than five minutes it was ready—and it went through the sprayer without any clogging. It went on fine with the brush too. The next day it rains we will use what is left to paint the chicken houses and cellars."

Carbola doesn't spoil by standing. Make your stable sanitary and bright, clean and attractive with

## A Modern Hog House

Written for California Cultivator  
By H. J. Baade, Napa County Farm Adviser

WITH the present high price of feed the farmers who own live stock and are able to make a profit by feeding animals find that modern equipment is very necessary and in many cases essential.

Mr. Homer Hewins, Jr., of Cali-

cleaning the troughs are left in the direct sunlight for eight hours. All pens are supplied with running water. The outside runs are eight by 40 feet, with rock foundations, well drained.

A special feature of the barn is the window and roof constructions which are so arranged that the sun's rays

A Modern Hog House  
On the ranch of Homer Hewins, Calistoga.

stoga, a breeder of Berkshire hogs and Holstein cattle, has built what we consider a modern hog house. The accompanying picture will give the reader an idea of how this house is constructed. The dimensions are 30 by 50 feet. It has six pens, or compartments, which connect directly with runs outside where the hogs can go to air.

The barn is also equipped with storage bins, running water, and wooden troughs lined with galvanized iron. These are not fastened. This makes it easy to clean and scrub them, which is done once a week. After each

strike the entire floor surface of each pen each day. The sun in rising and in setting occupies certain angular positions which, according to the arrangements of this barn, cause the run rays to strike all of the floor surface.

To keep the hogs from fighting, individual feed pens have been constructed around the self-feeders. Hog oilers are also kept in good repair and supplied with oil at all times. Mr. Hewins finds that by properly caring for hogs he is able to keep them in excellent condition and on a minimum of feed and receives excellent returns.

## Feeding Buttermilk to Hogs

Written for California Cultivator By Prof. F. W. Woll

ANSWERING inquiry of an Imperial Valley subscriber as to value of buttermilk for feeding to hogs Prof. F. W.

Woll of the state university gives emphatic warning against feeding buttermilk which may be taken from tanks allowed to become foul with injurious cultures. We have also heard others give warning to swine producers to be sure to know whether creamerymen allow washing powders or soaps used in washing creamery machinery to escape into the buttermilk fed. Any creamery which does this should not sell buttermilk for livestock consumption. Prof. Woll writes:

The effect of diluting buttermilk intended for pig feeding would be to decrease its feeding value. Undiluted buttermilk is worth at least as much as separator skimmilk for feeding purposes, but the more it is diluted with water, churn washings, etc., the lower will be its feeding value. If the dilution is carried so far that the volume is twice that of the original buttermilk the liquid will have no more value as a pig feed than an equal amount of whey. The dilution does not detract from its feeding value in any other way than that it forces the pigs to drink large quantities to meet their feed requirements, and more solid feed must be supplied to furnish sufficient nourishment for a satisfactory body growth.

Experiments have shown that the nutrients contained in skimmilk or

buttermilk are best utilized by swine if fed with grain in the proportion of 1:3 to 6 pounds of milk, preferably about 1:4.

Practically all buttermilk in this country is sour, being obtained as a by-product in the manufacture of sour cream butter. As such it is loaded with lactic acid bacteria which, as is well known, are healthy organisms. People who use sour milk as a regular part of their diet are less subject to disease and more likely to live to a ripe old age than other mortals, according to the claim set forth by the French physician and scientist Metchnikoff whose views have been accepted by good medical authorities. Nobody need, therefore, be afraid of drinking fresh buttermilk or sour milk or feeding it to pigs. When it comes to feeding buttermilk or any other kind of milk that has been kept in dirty tanks and allowed to ferment, the situation is different. It is, of course, dangerous to feed a material containing positively injurious substances like soapsuds, but dirt and filth are equally bad, for disease forming or putrefactive bacteria are likely to be introduced with it, and if nothing worse happens, may derange the digestive apparatus of the animals. In case of valuable animals, the injury done will be more disastrous than in case of common unimproved stock, but in either case cleanliness in handling and feeding the milk is of the greatest importance, and permanent good results in feed-

## Shorthorn Cattle and Berkshire Hogs

Shorthorn herd headed by Count Glory, 428982, grand champion at the California State Fair, 1916. Berkshire herd won Premier Exhibitor's banner at P. P. I. E.

513 Hearst Bldg., San Francisco  
Carruthers Farms, Mayfield, Cal.

ing butter milk can only be expected when it is fed without admixture of foreign substances (except pure water) and under strictly sanitary conditions.

This implies that the vat must be kept thoroughly clean and sterilized occasionally with live steam, so as not to contain diseased germs or give

rise to injurious fermentations. Under the new state dairy law, cream manufactured into butter must be pasteurized, and that should destroy all disease producing organisms in the buttermilk as well, but does not remove the necessity of taking all possible precautions to keep the buttermilk tank clean and in a sanitary condition.

## Revada Guernseys in the Public Eye

Written for California Cultivator By F. F. Stonerod

**W**HEN B. E. Nixon purchased his beautiful country place in the Napa County hills a couple of years ago he had in mind the establishment of a high class herd of registered Guernsey cattle, the production of a guaranteed grade of milk, and a permanent home for his family.

Since the ground was first broken in 1915 Mr. Nixon has erected a number of fine buildings, silos, put in a reservoir, and has the entire acreage of tillable land producing feed and forage for the big herd of Guernseys.

In selecting his cattle the owner of Revada looked to productive capacity and breeding rather than to show yard points although he has purchased several animals which won laurels at the state fair last year their first time out.

In a long line of splendid bulls and females two individuals stand out as leaders of the breed. One of them is Imp. Clatford Fay of the Mill 65657, and the other, Itchen Daisy May King of Langwater 17349.

Clatford is a remarkably fine individual and a heavy producer. She was born on the island of Alderney seven years ago. Her sire, Chieftain, was a noted Island show winner for two years in succession. Her dam was Betty 3rd. She is an A. R. cow with a high record although she has never been extended. She freshened on August 5 and gave birth to two fine bull calves sired by Ricardo of Edgemoor, the son of the world's fair champion bull, Itchen May King. Mr. Nixon has put her on test and she will have every chance to make a creditable record. She has large capacity, a remarkable udder, and everything else in her favor to be a champion. Itchen Daisy May King of Langwater is the bull Mr. Nixon paid \$8000 for, the record price for a Guernsey bull. The news that this famous young bull was to come to California and head one of the finest herds of cows was almost too good to be true. He was bought at private sale only after Mr. Nixon had all but exhausted his per-

suasive powers on the owner. I inferred that it was Mr. Nixon's herdsman, Geo. Hemming, who finally influenced the transfer, but be that as it may the fact remains that California got a Guernsey bull whose breeding, individuality, and proven transmitting ability stamps him and his get as a sire of the first magnitude. Indeed when it is considered that his two day old son sold at over \$1000 at public sale this spring, and two daughters at \$1375 each in the same sale; that two of his first daughters on test have made 555.53 pounds fat, and 591.52 pounds fat respectively, the latter in 340 days as a two year old; that he is a full brother to Ne Plus Ultra, whose first 12 daughters averaged 615.32 pounds butter fat in one year; and that his dam is also the dam of King of the May, 20 A. R. daughters, it will be seen why his former owner regretted parting with him even at such a long price.

Besides this noted bull Mr. Nixon has two others which have an opportunity to make a reputation. Both have excellent breeding and are good individuals. Ricardo of Edgemoor 34367 is a real show youngster, having won his spurs at San Francisco, and will add more laurels. He is by Duppee's world champion, Itchen May King, and out of Imp. Lady Gip, 55121, a cow who has a record of better than 600 pounds butter fat in one year.

Imp. Roberts Secret, 30805, has enough breeding and records in his pedigree to assure him high rank among the bulls of the breed. His sire, Imp. Osseo 4th was a noted winner on the island while his dam, Guernsey Fleurie 3rd of the Cloture, 8459 made 598 pounds butter fat in one year.

Geo. Hemming, the manager of Revada, is a capable and efficient man in his line. Under his expert management enviable records may be looked for both at the pail and in the show yard.

Fresno County is making a hog cholera campaign.

## Skimmed Milk Hard Diet for Calves

Calves raised on skimmed milk are usually runty, pot-bellied, and suffer indigestion. Whole cow's milk is a perfect food for the calf, but skimmed milk is not. When the fat is removed a substitute is sometimes made by adding a handful of flaxseed meal or corn meal, but this sort of fat is not a full substitute for butter fat.

It is still a debatable question whether it pays in the long run to rob the future cow by stunting the calf for the sake of immediate profits. The practice of taking the calf immediately away from the cow is the usual thing in the dairies and, assuming that it is an economical thing to do, the question is how to feed calves on artificial food and keep them growing properly.

During the first few weeks the calf

is not capable of digesting normally any food save whole cow's milk. If he must subsist on skimmed milk, a little flaxseed meal or corn meal had better be added to the meal. The milk should always be given warm and never when it is frothy. Calves should never be given enough skimmed milk to entirely satisfy their hunger. If indigestion develops they should be kept on short rations for a day or two. If scours develops a little formalin added to the milk, combined with a restricted diet, will usually control it within a few days.—George H. Glover, Colorado Agricultural College.

# Midsummer in the Poultry Yard

Written for California Cultivator By Jean A. Koethen

**M**IDSUMMER is the time when it is easiest to neglect the ordinary routine of the chicken yard, yet it is also the time when many unusual things may be done to best advantage. The spring rush is over, baby chicks half grown, pullets well on their way to maturity, cockerels already gone to market or caponized, perhaps, to be held for Christmas orders.

That caponizing idea, by the way, seems to be gaining ground. I have not tried it, mainly because of a natural shrinking from cutting up live chickens, but also because doctors themselves seem to disagree. The people who have the most to say about caponizing are chiefly, though not exclusively, of course, those who have caponizing instruments or books on the subject to sell. Some others declare that the caponized cockerel gains very little in weight over the uncaponized bird, and that the only

object in caponizing is to make the birds less quarrelsome and willing to hover chicks. Undoubtedly the capon is a good mother and he can cover many more chicks than a hen. With an incubator for hatching and a few capons for mothering, one might easily dispense with both hens and artificial brooders for rearing chicks.

If any caponizing is to be done the late cockerels, which are now two or three months old are the ones to be caponized. They are not worth much as fryers and will be too young for breeders another spring. It would be worth while for almost any one with a steady hand to buy a set of instruments and try making a few capons to use as brooders. The operation should be performed as soon as the testicles, which are under the ribs on each side of the back, can be plainly seen, and before they begin to develop. With some breeds this is as early as two months of age, with others it may be four or five months. I dressed a Light Brahma cockerel last week, which, though nearly five months old, was in just the right stage for caponizing. A little experience will soon teach one the exact size of bird to select for this operation. It is best to begin with one you wish to eat, for the beginner is very likely to kill a few in learning. The instruments are always accompanied with explicit directions for their use, which should be followed with exactness as to each detail.

With the beginning of the molt, dropped feathers give the yards a particularly untidy appearance. It is some trouble to rake these up, but well worth while if one cares to have the chicken yard look like the "park" it is sometimes called. A flock of vigorous, red-combed birds loitering comfortably in the shade in neat, well-raked yards is always a pleasant sight and one in which the owner cannot fail to take pride.

Do not spare the hose in summer. Wash off the roosts and walls of the house after the droppings have been carried out. Get the cobwebs off the under side of the roof. Sprinkle the yards often and do not forget to have one particular place under the shad-

iest tree where the ground is soft and moist for dusting. Liberal use of water saved my hens in that extraordinary hot spell last June. I sprinkled the ground several times a day and the inside of the house at least once. I even sprinkled the trees so that the water might drip from them. Three times during the day fresh drinking water was given. When I found a hen panting under the roosts I took a stick or the hose and drove her out into the shade of the trees, for it is in the stuffy air of the house and not in the open heat hens die of heat.

There will be many broodies this month. If you have the eggs, try setting some of them. Those that are to be broken up must be broken gently. Roughness never paid yet in handling hens. A small slatted coop, just big enough to hold three or four hens—a frame covered with chicken wire will do just as well—that can stand in the run where the confined broody need not be too lonely, is almost a necessity where hens are kept. Put your broodies in this as soon as you find one staying on the nest at supper time. Give the feed they are accustomed to and fresh water. In four days let them go. In almost every case the desire to incubate will be gone by this time, and they can return to the laying pen.

Broodiness in the heavy breeds is very largely the result of an overfat condition. A hen that receives in summer the same ration she has been accustomed to during the season of high production will put on fat because she is not laying as heavily as she was. The feed that should have gone into eggs now is turned to fat. "As long as you can keep a hen laying she won't get overfat," says a well-known Orpington breeder. Conversely, if you can keep her from getting fat by judicious feeding she will keep on laying, but this is not always true, for most hens stay laying while they molt. The point is, however, that it is always safe to lighten the ration of heavy hens in summer. Give more green and less mash, and since hard grain is both expensive and fattening, feed as little as your judgment can be brought to approve. I am not sure that individual judgment can always be relied on. If you feel doubtful, take Professor Dougherty's rule of a quart of grain per day to 15 hens, and cut the amount down a little for summer.

The daily papers as well as the agricultural journals are reminding us that fall is spring in California, and now is the time to plant several things. Two of these are chard and kale, which if planted now in boxes will be ready to transplant into the ground about the time the fall rains begin. Chard, once started, lasts a good many months, and kale will furnish green feed for the hens for a year to come. There are the mangel beets, too. My hens have always scorned the roots, but the tops make splendid green feed, as do turnips. Hens like nothing better than turnip tops, and the turnips themselves may be cooked as part of the vegetable mash for breakfast or supper. All these things may be planted this month. August isn't the time to exhort to garden work, nevertheless, our extremity is such I think we shall have to plant, no matter how much we dislike it. Five o'clock in the morning is a splendid time for gardening.

If water is plenty there is no reason why in most localities the empty runs should not be planted to rape or barley. When water is scarce or expensive it is better to wait a month or so.

Santa Barbara County is appealing for suspension of the rabbit laws.

# Poultry can be made to Pay

**T**HERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

# Poultry for Profit

BY

Jean A. Koethen

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on egg-shell book, binding full cloth vellum de luxe.

# Science Says Buttermilk

Is the only preventative for White Diarrhoea. It further states that many birds that are apparently in perfect health have the germs in their system and that these germs are transmittable from both male and female to their progeny. Reference Bulletin No. 162—issued by the Department of Agriculture, Berkeley, Calif. Write Berkeley for this bulletin.

Don't take any chances, use Globe "A-1" Buttermilk Mash. It prevents White Diarrhoea, it increases the appetite, it aids digestion, it produces more eggs for market and better eggs for hatching and it costs No More than other good mashes.

It's the Lactic Acid in Buttermilk that does the good work. The dry buttermilk we use, chemically shows 10,000 Live Active Lactic Acid Bacilli to the cubic centimeter. Write us for Free Literature and sample of this wonderful feed. Not an ounce of filler used. Satisfaction guaranteed or money refunded.

**GLOBE MILLS, Los Angeles**

# Buttermilk GLOBE A-1 Dry Mash

## Mr. Poultryman: TRI-STATE MOLT MASH

will help your hens through the molt and make it possible for you to stay in the business.  
SOLD by our agent in each town or inquire of GLOBE MILLS, LOS ANGELES, Southern Wholesale Distributors, or TRI-STATE POULTRYMEN'S COOPERATIVE ASS'N., Headquarters, Fresno, California.

## RIDING IN THE TONNEAU

Did you ever go touring with friends when you were given your choice of a seat in just about such a way as "Which would you rather do or ride in the rear seat?" asks Frank Farrington, writing in the current issue of American Motorist.

Continuing, Mr. Farrington says:

"Some people like to ride in front and some like to ride behind, but it is my observation that the people who like the tonneau are just as likely to have the front seat wished upon them, while those who want to get in behind the windshield quite frequently have to take the breezes in the rear.

"I don't think the driver, or the person in control of the driver, gives sufficient thought to the comfort of those poor, luckless wights back there at the mercy of the gales and the swaying and swinging and skidding of the car on poor roads.

"Plenty of owners, thinking to give the old lady a pleasant afternoon, have put Aunt Emma through such an experience as she would not undergo again for a peck of potatoes or a bushel of onions. The care-free individual who habitually drives the car knows mighty little of what it is like to ride behind with a feeling that there is nothing between life and death but a trust in Providence and a firm grip on the top braces.

"For the people who like the rear seat, who are accustomed to it and who are equipped for it, nothing need be said. They are happy there or anywhere. But I think some consideration should be given the people who have not motored enough to believe the driver is inspired by the Almighty and competent to work miracles with a steering wheel and two sets of brakes."

## PROPER WAY TO WASH A CAR

The commonly used rubber hose is perhaps the best method of cleaning the lower portions of the car, such as wheels, running gear, mud guards, etc. But it is positively injurious when used on the body and highly finished surfaces, says a writer in the current issue of American Motorist. The force with which the stream of water impinges on the surface causes the sand and dirt adhering to the body to be driven into the varnish, destroying its brilliancy, and no amount of polishing and rubbing will restore its former lustre. The body should be washed with lukewarm soap and water and immediately dried with a soft chamois. Many owners use a mixture of cylinder oil and kerosene which they apply on the body, rubbing it dry afterwards. Another scheme is to use a mixture of boiled linseed oil and turpentine applied sparingly and rubbed absolutely dry. The use of this polish will restore even an old car to a degree of splendor that will please the user.

## LAW OF COMPENSATION

Charles' mother was reproving him for not being more tidy about his hair, when his uncle, who was very bald, thinking to soothe his feelings said: "Charles, don't you wish you were as bald as I? Then you wouldn't have any hair to comb."

Charles heaved a long sigh of resignation.

"No, I don't," he said. "There would be that much more face to wash."—Exchange.

## DIFFERENT ANSWER

"Am I the first girl you have ever loved?"

"No, you are the sixteenth, and my taste has been improving right along."—Kansas City Journal.

## Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 31,000 readers, weekly.  
Liner rates: Single insertions 30¢ per word;  
yearly contracts 2½¢ per word. 35¢ per issue minimum charge.

In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

Pattern Department  
California Cultivator  
Los Angeles

## Household Department

HO! FOR THE COUNTRY ROAD  
Out into the hush of the rose-flushed dawn,  
That is wakened by bird song, low and sweet,  
We take our way on the open road,  
Where no sound is heard but the engine's beat.

The prairies stretch out like a wide, green sea,  
Far out to the blue horizon's rim,  
Where the last, late star of the night has dropped  
Down into the shadows, cool and dim.

O, the glad, free life of the open road,  
Out where the breezes of Heaven blow;  
And what is tomorrow or yesterday?  
Fling care to the winds, as away we go!

I sing as I swing to the engine's beat,  
The soft winds tossing the grassy sea;  
You may cling to your walls of bricks and stone  
But the boundless sweep of the road for me!  
—Florence Jones Hadley in American Motorist.

### TOMMY COTTON

Written for California Cultivator  
By Mrs. P. E. Tucker, Visalia

**T**OMMY COTTON was a half-grown kitten when I got him, and he was not white, but red, having made his bed a few nights before in a can of red ochre dust some painters had left uncovered. Calling on Tommy's mistress one morning she asked me if I would take Tommie to the country as she could not wash the red out of his fur. So I took Master Cotton home with me.

Tommy had a passion, it seems, for a family of his own. A few nights after he came I had an old hen refuse to own a bunch of chickens, so I took them to the house and put them in a box with a cloth over the top. The next morning I found Tommy Cotton in bed with the chickens. Being a cold wet day I kept the chicks that day and night in the house. The next day I made a small yard and a house of a box with a cloth I could raise and lower above the chicks and put a small thin feather cushion on top. The chicks went under the cushion from the yard; Tommy went to bed on the cushion under the roof. In a few days those chicks would follow the cat around the yard and cuddle up around him in the sun, and with Tommy's help I raised 20 out of the 24 until they were large enough to broil.

One evening, coming home from town late, on putting the chicks to bed I found six of the youngsters missing, and no amount of calling or hunting brought them to light, and no Tommy either so I shut the others up and did the rest of the chores. About nine o'clock that evening I heard the cat call as he did when he called his family so I thought he wanted in. I took a light and went out, and there sat Master Cotton by the back of the summer kitchen, but he would not stir when I called to him, only to take his paw and reach in under the floor. I went and looked to see what he had, and there in a corner of the shed were those six little strays cuddled as close to their adopted dad as an inch board would allow.

Every day those chicks had fresh meat for breakfast or dinner. It was certainly amusing to see them scamper when Tommie came in with a big squirrel. He would eat the head off, then sit down and call. When those chicks were two and a half months

old they were taken to the chicken house, which nearly broke Tommy Cotton's heart.

He promptly took possession of a litter of seven little day old puppies, greatly to the mother's displeasure, and for a week it was which and tother with Tommy and Picus over those pups. At last Mother Picus gave up and allowed Tommy to share her home and family.

When they were old enough to run around, every morning while I did my chores I would see Tommy coaxing those pups out to the alfalfa field where he taught them all to hunt squirrels and gophers. But being little house dogs and full of funny tricks I again broke up Tommy's adopted family but kept one for him, and some day may tell of little Polly-wiggle, and what she learned to do, which is almost as interesting as what Tommy did.

Now comes the strangest part of Tommy's doings. For some weeks something had disturbed the incubator chickens at the chicken house at night. So I set some traps and in the morning one trap had been pulled loose and was gone.

A few days after I saw Tommy take a squirrel under the house and leave it, and he did the same thing every day for about a week, until I came to the conclusion he must be feeding something there. But it was so dark I could see nothing; so I caught Mr. Tommy and shut him up. On the third morning of Tommy's confinement, a beautiful black and white, small, long distance scent bottle crept from under the house and ambled up to the door with my missing trap on its hind leg. Well now, but this was the limit, and also the last of Tommy Cotton's family notions of adopting some other father's offspring.

Tommy did not live many weeks after this last odorous child of his adoption was dispatched, whether from grief or too high living we do not know.

Tommy Cotton lies in the garden under the cherry tree after three years of a very useful life.

### "HE PRAYETH BEST WHO LOVETH BEST—"

Written for California Cultivator  
By Ida Jones Griffiths, Caruthers

**W**OMEN have been known to make pets of tigers, elephants, monkeys, men, and all sorts of other wild animals, but not many can boast of having had a pet mouse. Women and mice seem to have very little in common, and few know how engaging a mouse can be.

Should Mistress Mousie visit our homes at night a piece of toasted cheese enticingly placed in the jaws of death is the only welcome she is likely to receive; if she ventures into our presence during the day we are too busy climbing chairs and tables to think of being friendly. As a rule no one dreams of cultivating the social side of a mouse, and cannot imagine what an engaging little creature she is.

A few summers ago, when camping out at Big Creek, I met the only mouse I ever got acquainted with. I had been out all the morning and was hurriedly walking along a trail that led to lunch, when I espied a wee baby mouse rushing around plainly hunting for home and mother. Now

babies, be they furred, feathered, or human, are my delight and lost babies are especially appealing. So you can guess that at the end of the trail we lunched together quite happily.

When my father and brothers returned to camp that evening I proudly displayed the new baby, but they were quite unimpressed, although later they found my pet rather amusing.

At first Mistress Mousie lived on tiny drops of milk licked off her whiskers, but after a while she took to nibbling crumbs of bread, cake and cheese, with tiny drinks of milk in between. She made her repast very leisurely—a few nibbles at a crumb, a sip of milk, then she would sit up and trim her whiskers, wipe over her face, neck and ears, after which she would nibble another crumb, take another drink of milk, and attend to her toilet once more. This continued throughout the meal; a nibble, a drink, and a wash, over and over again, until she had eaten enough. It was most amusing, especially when she sat on her haunches cleaning herself, and I wish that every boy and girl that object to having their faces washed could see how diligently Mistress Mousie went into the corners, and the attention she paid to the part behind her ears!

She soon became very fond of me and liked nothing better than to snuggle up in my hand and go to sleep. My bed was out under a big pine tree, and hers was in a paper sack suspended from one of the branches. Every afternoon when I lay down to rest or read I would take down the paper sack and put it on my bed, and she always crept out and went hunting all over, running here and there, until she found my hand. Then she would snuggle down in the palm and go to sleep.

Being well-fed she never bothered our food, and soon became fat and sleek and grew very fast. She was never timid when alone with me, but feared my father and brothers, and greatly objected to loud noises. My brothers loved to watch her feed. As a diner out, they said, she was the cutest ever, and were especially delighted with the way she scrubbed the back of her neck and behind her ears. If either of them made the least noise during the performance she would rush into my hand, and peer out at them with black beady eyes.

One evening I was bending down watching her eat supper, when my

brothers rushed into camp, announcing their return with a loud and joyful noise as usual. This scared my little pet; she sprang to my knee and disappeared over my shoulder in a flash. We searched everywhere but could not find her, and gave her up for lost. An hour later I felt something move in my hair, and there she was hiding amongst the hairpins!

One morning I found her gone. Anyone who has ever lost a pet will understand how I missed her. More than a week later I was awakened by something scampering over my face. I opened my eyes, and there was Mistress Mousie. I put out my hand, and she ran into it, snuggled down in the old way and went to sleep. After this she would be missing several days together, but each time on her return she was as tame and affectionate as ever.

At last she returned no more. I often wonder what became of her. My brothers believe she was killed, but I like to think that, at the perfect end of a perfect day, my little pet met Mr. Mousie, and together they went forth on the Great Adventure.

SAIRY WINKUM  
Written for California Cultivator  
By Louis H. Wheeler, Chino

I would like to tell you a story about Sairy Winkum just as it was told to me. That is the name of an old blue hen that has always kept us laughing at her because of her funny habits. Among other things she does is to come and pick my apron when hungry. She will take hold of the hem and jerk, jerk until I look down, then she scratches the ground and looks as if trying her best to see a grain of wheat; then she looks up at me and gives such a comical slow wink. I think her eyes are different from any other hen's, but it always seems like a well-planned scheme to get any extra feed; and I have to admit that it usually works, too. So you see why we call her Winkum. Then father said that was only a last name, after all, so he put in the Sairy. Usually Sairy furnished us with her share of big white eggs, but if ever she made up her mind to sit, there was no making her change it. Sit she would; if not on eggs, then on something else. Once she even tried to coax pussy's kittens into a nest; but puss soon settled that by carrying them one by one clear out of her reach.

One morning father came in laughing. He had a basket, and as he set it down, he said, "Well I reckon we'll break Sairy Winkum of sitting, this rip." I peeped into the basket and saw nine good sized turtle eggs. Father!" I exclaimed, "where did you find them? I'm sure Sairy won't have a thing to do with them. She would rather mother cats than those things."

Father just laughed and said, "Well, we'll see. I found them in the sand down by the river and we'll see some on any way." So he fixed a nice nest and put the eggs in, then showed it to Sairy. She never hesitated a bit, but just settled herself over those eggs as if they were quite the proper spot.

Of course we didn't expect her to stick to it; we thought she would gure out in hen fashion—some way—that those were trouble makers, but he didn't. When we would look in on her she would greet us with an awful squawk and that same ridiculous low wink of hers, and soon it became the habit of every farmer with-

in miles of us to ask laughingly about Sairy and her eggs.

And then one morning father called us to come and see Sairy. There was poor Sairy Winkum, almost distracted, every feather standing out, and in the nest into which she was looking were nine little squirming, snapping turtles.

Utterly perplexed, several times she tried to hover over her uncanny brood, but the situation was too much even for Sairy; and with a prolonged squawk she flew clear across the garden and deserted her freaky family. And from that day to this she never again insisted on setting. But she keeps her funny slow wink and nothing would tempt us to part with Sairy Winkum.

AN UNWELCOME GUEST  
Written for California Cultivator  
By Ida M. Blake

It really is hard to believe that a skunk can have good manners, and perhaps this one might not have if its disposition had been put to a severe test. But anyway there is a skunk or at least there was a skunk in one of our mountain canyons that demands a good deal of respect for its behaviour on a certain night not long ago.

You see John's sister has a mountain cabin in this canyon where the family often spend a pleasant weekend, (providing no unpleasant disturbances occur).

John having finished his college course, was seeking rest and recreation for a few days so decided that the canyon was an ideal place. While there alone he showed his good judgment by sleeping out of doors, and all was well. One evening a friend of John's, Harry Lincoln, arrived on the scene, and as matters of business would not permit a long visit they both decided to sleep indoors rather than bother taking an extra bed outside. Of course like all modern thinking people they wished to leave doors and windows open, which they did.

Late in the night Harry awakened with a start to hear a strange nibbling sound in the cabin. It was as dark as a pocket and you may be sure there were no electric light buttons to press in that mountain wilderness. So John waked up and a serious discussion of the situation took place in whispers. "What do you suppose is in this room, John?" "I don't know, but maybe it's a skunk." "Well, what do you suppose he is eating, he seems to be nibbling something,"—then with a sudden start of memory, "Why I left a bag of peanuts on the table and the animal is having a feast."

It was then decided that a light must be had; but where were the matches and where the candle?

Men may be brave in battle but when there are prospects of a skunk in a room they seem to be perfectly willing that the other fellow should be "Johnny-on-the-spot." After stealthy manoeuvring on the part of both, a "bug-light" revealed to their expectant gaze a pretty black and white animal contentedly eating peanuts on the hearth.

How to get the animal out of the house was a question. Harry decided that he wanted the peanuts worse than the skunk did, so as the bag was on the table within arms reach, he carefully secured the treasure and hid it under his pillow. John conceived the bright idea of throwing a few peanuts out on the steps for a

bait, and sure enough the scheme worked to perfection and the skunk took his departure. You may be sure they were not long in closing and locking the door. Several times the skunk begged to come in but the boys thought his good manners had been sufficiently tested and would not listen to his pleading.

PRIZE WINNERS  
Prize winners this month are Mrs. P. E. Tucker of Visalia, first, for her story of Tommy Cotton, and Ida Jones Griffiths, Caruthers, second, for her mouse story.  
A number of other delightful stories are coming.  
The subject of the September contest will be announced next week.

FINDS EASY WAY TO PEEL PEPPERS FOR HOME CANNING PURPOSES

How to peel peppers easily for home canning has been found out by the University of California. This is by dipping the peppers or pimientos in boiling five per cent lye for half a minute to a minute and a half and then washing them immediately in cold running water. After chilling the skins may be slipped from the peppers. The peeled peppers have been canned successfully in the laboratory by placing them in solder top cans, filling the cans with hot water or a weak brine, sealing the cans with solder, and cooking in boiling water for 15 minutes. The cans must then be chilled by immersing in cold water. The five per cent lye is made by dissolving 6½ ounces caustic potash or caustic soda in one gallon of water.

LESS WORK

No coal, wood or ashes to lug. No waiting for the fire to burn up. Meals in a jiffy and a cool kitchen all the time. Bakes, broils, roasts, toasts. Better cooking because of the steady, evenly-distributed heat. More convenient than a wood or coal stove for all the year 'round cooking, and more economical. The long blue chimneys prevent all smoke and smell. In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

NEW PERFECTION OIL COOK-STOVE

STANDARD OIL COMPANY (California)

MORE BETTER LIGHT

Install a PRIVATE GENERATING PLANT and have ELECTRICITY FOR LIGHT AND POWER. The Uni-Letric system generates the standard 110-volt direct current, which will operate from 1 to 50 lights. It will run your sewing machine, electric iron, vacuum cleaner, churn, washing machine, etc. NO BATTERIES---NO SWITCHBOARD High speed gasoline motor, generator and automatic governor, all complete. Uses standard lamps and fixtures. Can be used for one or more houses. WRITE FOR ILLUSTRATED CATALOGUE TO KARL A. HEDBERG 104-106 Clay St. San Francisco, Cal.

## Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal. Unsigned communications receive no attention.

### Sick Calves

Does extreme hot weather, 114 to 116 degrees, hurt new born calves? I have one that is very sick and pants all the time and another that is not so bad. They were sucking the cows but lost appetite so I have to pour the milk down their throats. Please tell me what is wrong?—Subscriber.

Hot weather does not usually affect young calves unless they are left

right out in the sunshine where they will be exposed to the heat of the sun. Could not guess what is wrong without more symptoms and the history of the case.

### Breeding a Mare

Have received much benefit from reading your paper, now would like to ask what I must give a mare to get her in heat as I have a fine chance to breed her. Any suggestions will be thankfully received.—Subscriber, Victorville.

First get the mare in fine condition; not too fat, and give her plenty of exercise. There is no medicine necessary unless you give her a tonic to improve her condition. You might try some powders containing four ounces of gentian, two ounces of nux

vomica, two ounces of sulphate of iron and enough ground fenugreek to make one pound. Mix. Give a tablespoon of the medicine once a day.

### Sick Hog

Have a Duroc-Jersey sow seven months old which is lame in the hind quarters. She is worse some times than at others. I feed beet pulp, bran and middlings in equal parts. The rest of the hogs are all right.—Subscriber, Wheatland.

It may be rheumatism. Give these powders: Two ounces of salicylate of soda, two ounces of bicarbonate of soda and two ounces of powdered buchu leaves. Mix. Give a teaspoon in the feed twice a day.

### Cow Not Breeding

I have a cow about three years old which does not get with calf. She comes in heat all right. Have examined her and find the os closed, opened it but that did no good. Have washed her out with baking soda, etc. She was fresh about eight months ago. Is it contagious? Can you recommend some practical up-to-date book on the diseases of cattle and hogs.—Subscriber, San Jose.

We believe that the best answer to this question is to refer the writer to the columns of the Cultivator as far back as he is willing to go. Scarcely a month passes without the cultivator containing several answers to questions almost exactly like this. The government issues a book on the diseases of cattle. We presume you could get one by writing your senator or representative. If the readers of the Cultivator would save their papers they would soon have an answer to almost any question they might ask. An index is printed twice a year and by referring to that one could turn to a question and answer that would just fit his case.

### A GLIMPSE AT THE WORLD'S MARKETS

Heavy rains in Texas give more promise to the cotton crop, to which New York responds by beating down prices to the extent of \$3.90 per bale. Prices are now ranging from 23 to 25 cents. New Orleans spot market on Tuesday was from 23.12 to 27.

The office of information of the United States department of agriculture announces that a survey of all stocks of wool in all parts of the United States is to be made. According to preliminary summary there are now in hands of dealers and manufacturers 370,000,000 pounds of grease wool, 47,000,000 pounds of scoured wool and 29,000,000 pounds of pulled wool.

The Strawberry Growers' Association of Northern California has fixed on \$5.00 per chest as their minimum. The minimum was not reached this season until August 19.

Meat packers of San Francisco are

marking up hogs, but California quotations do not yet approach the Eastern prices. Chicago prices are now practically at the 20 cent mark.

Promise of immense corn crop is tending to weaken prices somewhat in large grain centers. Oats reflect closely the corn condition.

Los Angeles is proving a good apple market this season, some Greenings selling at \$1.25, but prices are generally holding above the \$1.50 mark.

Los Angeles potato prices are far better than anticipated, ranging between \$3.10 and \$3.40. Onions are still in the dumps.

Wheat dropped below \$2.00 per bushel for the first time in weeks in Chicago on August 16. General trade conditions are good, but fear of government price control prevents speculation.

Riverside proposes to install a dehydrating plant for handling all kinds of fruits and vegetables. It is proposed that before another season a plant that will be able to handle over 25 tons of potatoes a day will be in operation.

The Breeders Gazette predicts that corned cattle are due to reach \$15.00, in fact, \$14.75 has already been paid in Chicago for some exceptionally fine steers.

A great many feeders range cattle from the Northwestern drought sections are being thrown on the market at \$9.50 to \$10.00.

One week recently showed a decline of 65 cents on spot corn in Chicago.

It is probable that before this column is read highest quality hogs will be commanding 20 cents per pound in the Chicago stock yards.

Reports from United States Weather Bureau correspondents for the week ending August 21, 1917, are to the effect that the weather was unusually favorable for the advancement of growth, and it was especially favorable in the Coast counties, where the nights and mornings were either cloudy or foggy and the days were sunny and warm. The barley harvest is practically completed and the thrashing yields continue satisfactory. Corn is making good progress and the kafir and milo varieties are looking remarkably well. Some farmers have begun cutting green corn for ensilage. The peach harvest is well advanced and the yield is good, except the fruit is slightly undersized as compared with last year's crop. Pears are dropping more than usual, which it is believed is due to the hot spells that occurred last June and July. Grapes are ripening satisfactorily and shipments of Thompson Seedlings and Malagas from the San Joaquin Valley are increasing rapidly. Red spiders are unusually numerous on the almond trees and growers will spray for them if the pests get any worse. Farmers are still planting late potatoes and this crop made good progress during the week. In a few of the northern counties and also on the land back of the Sacramento River, potatoes are poor; but in the localities where the acreage is largest, the crop is generally in a promising condition. The bean harvest has begun in the neighborhood of San Diego and the recent weather has been especially favorable for this crop. The acreage is large and while some inexperienced growers planted too early and their crops did not bloom or set well and others lost heavily through grasshoppers, the general outlook for this crop is good. In the southern counties some complaint is made of aphides injuring beans; but this pest has not become general and no spraying for them has so far been reported as having been done. Rice is doing splendidly and no complaints are made about this crop. Some lice are reported on lowland hogs, but it is thought that they will not do any great harm. The sugar beet harvest is progressing slowly and labor for handling this crop as well as for general farming is scarce and costly.

## We will Reward You With This Great Book

Everybody can have a copy under our liberal offer. Send for yours today.

### Greatest Book on Feeding.

"Feeds and Feeding", by Henry and Morrison, is the recognized standard authority on the feeding of dairy cows, beef cattle, calves, hogs, horses and sheep. The authors at great expense and with much time and labor, have compiled the most important findings of the investigators of both the Old World and the New in the science of animal nutrition, together with the vast number of feeding trials, conducted in California and the experiment stations of other states, the whole being rounded out by the practical experiments of many of the leading stockmen of America.

## How to Get Best Results Feeding California Barley

"Feeds and Feeding" is a large volume, 701 pages in substantial cloth binding, clearly printed in large type and written in plain, understandable language. It is intensely interesting throughout and represents the sum total of hundreds of experiments, trials, and record tests on practically every feeding combination ever attempted and the personal experiences of the authors and many other noted feeding experts from California to Maine.

Full and complete information is given in regard to the feeding and feed value of California barley, how to obtain the best results, and giving the results of many barley feeding tests. (Pages 163, 303, 309, 360, 414, 454, 525, 590.)

### Only takes a Little Time.

You can obtain one of these valuable books at no expense—just a few minutes' easy work. To any reader of California Cultivator who will secure for us only three new yearly subscriptions to California Cultivator at \$1.00 each—the regular subscription price, we will send a copy of the latest edition of "Feeds and Feeding" by Henry and Morrison. If you want to buy this book it will cost you \$2.25 anywhere. You know California Cultivator and how much valuable information you get from its columns each issue. You receive the best thought and experiences of many of the West's most authoritative writers, the results of many tests and experiments and the live stock, dairy and agricultural news of what is going on over the entire Pacific Coast at a cost of only \$1.00 per year. Your neighbor, if he is not already a subscriber, will be glad to have you show him a copy. You can get three new subscribers at \$1.00 each quickly and easily. Send us the \$3.00 and the subscribers' names and addresses and we will send the book to you postpaid. You may include your own subscription by paying a full year in advance of this date and including two new subscriptions at \$1.00 each. There must be at least two new subscriptions for one year.

## HOPS

Hops have been showing spectacular  
advances; some sales reported as high  
as 30 cents.

## HAY

Under date of August 18, Scott, Magner  
& Miller say:  
Receipts past week 2800 tons, last week  
3152 tons.

Receipts are small for this season of  
the year; shortage of cars can be given  
as the reason. Most receipts during the  
week were brought in by water, that ar-  
riving by rail being mainly in gondola  
cars which cannot be used after the wet  
weather starts in. The future outlook is  
anything but promising to those han-  
dling hay. Owing to the very high  
prices at the close of last season for the  
old crop many consumers went into the  
country and purchased without figuring  
difficulty of transporting and are now  
unable to get it.

We quote today wholesale prices in  
carload lots as appear from dealers'  
transfers upon the market. For prices  
to consumers charges of cartage, com-  
mission and handling expenses must be  
added.

## Citrus Fruit Market

Los Angeles, Aug. 22, 1917.

The Valencia market has been spotted.  
In general the tone is somewhat easier.  
First class stock, however, commands  
fairly quick service. Immense quantities  
of deciduous fruit are filling all markets;  
California pears are one of the heaviest  
factors.

Lemons are still selling at good prices,  
some sales reaching as high as \$8.00, but  
the cool spell has materially lessened the  
keen demand. Besides many dealers are  
fairly well stocked and are waiting for  
lower prices. Shipping of lemons at this  
moment is exceptionally light.

## Shipments

Shipments of oranges from Southern  
California to date since November 1, 1916,  
36,420 cars, lemons 7235, total 43,655. To  
same date last year; oranges 28,729, lem-  
ons 6251, total 34,980. From Central  
California to date; oranges 5044, lemons  
164, total 5208. To same date last sea-  
son; oranges 5398, lemons 146, total 5544.  
From Northern California to date; or-  
anges 845. Same date last season; or-  
anges 60, lemons 1.

## FROM THE AUCTION

## A Good Tractor to Own

A **MOGUL 10-20** kerosene tractor will go a long way toward solving your labor and expense problems. Men who use this tractor properly say it does as much plowing, disking and harrowing in rush seasons as three men and nine horses. In the heat of the harvest fields, and for summer plowing, three four-horse teams can hardly keep up with it, because it works steadily all day long.

Besides, it is so simple that almost anyone can learn to handle it efficiently. A few days' training in the handling of a kerosene engine is usually all that is needed.

These two features make the **Mogul 10-20** highly desirable. Add to them the fact that it operates on a fuel that you can always buy, and at a reasonable price, and you have a power plant that is hard to beat for all-the-year-round work in the field or at the belt.

You know the standing and reputation of Mogul tractors. When you buy a tractor, don't overlook this good, simple, reliable, economical three-plow **Mogul 10-20**. Booklets and folders give complete information. When you write for them, address

**International Harvester Company of America**

## Can You Spare a Few Hours Each Week to Handle a Profitable Local Agency?

We need a representative in each county to put the Fruit Growers, Live Stock Men, Farmers, Dairymen and Poultrymen in touch with the money-making ideas, results of experiments and real farm and live stock information of value to be obtained from California Cultivator.

Only a small part of your time is needed each week to make money under our plan. We want to secure the services of men and women who can present a meritorious offer. You don't have to have previous experience. If you can do as well as others who had no more training than yourself, you can make splendid wages just for your spare time.

Our proposition interests every producer. There is an opportunity here for you—if this fits your case. If it does write to

# \$100 PONY TRACTOR ATTACHMENT

From Ford to Pony Tractor or Pony Tractor to Auto in 5 Minutes

It will do more work in a day, a month,  
or a year than any other auto tractor.

THE KING OF THEM ALL

**Lightest! Cheapest! Best!**

NO OTHER TRACTOR CAN PRODUCE EQUAL RESULTS AT SO SMALL COST!

The Pony Auto Tractor. It does more work in less time, and with less effort and expense.

How to plow, plant, harvest and market the crop of two acres with the same time and cost it has taken for one acre; how to do in one day the work that has taken two days; how to double production without increasing expenses is the World problem the PONY tractor attachment was designed to solve.

Using two horse implements the PONY will do the work of four horses for years without any expense for wornout parts.

The PONY does better work and more of it. It does the work quicker and at less cost. It lasts longer, and is easier and simpler to operate, has more power at less expense and greater efficiency with less effort.

## Special Features of the PONY

- it sells for only \$100.
- one person operates auto and implement from seat of auto.
- attached to a Ford it does the work of four horses. Other cars in proportion.
- needs no oil or grease; has no wearing parts.
- no gears to grind—nothing to get out of order.
- guaranteed more miles per gallon of gasoline than any other tractor pulling the same load.
- it turns in the same radius as the auto to which it is attached.
- it works for years without any expense for worn-out parts.
- it does not require an able bodied man to operate it.
- changed from auto to tractor in half the time required to harness and hitch up a team.
- you can drive to the field in your Ford, change to tractor, work all day, change back in five minutes and drive home in the auto.
- speed 2 to 15 miles per hour according to road and load.
- operates at less than half the cost of animal power drawing the same load.
- the PONY can work as long as desired every day in the year, if necessary, and costs nothing when not working.
- it holds walking plow in furrow without attention from driver. Plow raised and lowered at will from auto seat.
- the PONY is the real one man tractor; it is made to do the greatest amount of work with the least effort and expense.

—broad tractor wheels, 12 inches wide, replace the rear auto wheels. Each is fitted with 16 steel grousers. Rolled steel tires, five inches wide, replace front auto tires.

—an efficient lever raises a walking plow clear of the ground, enabling operator to back or turn square corners. The same lever can be adjusted to raise a cultivator, chisel, sickle bar, dump a rake, operate a disc or other implement from driver's seat.

—for a small investment an auto can be converted into four-horse service for farm use.

—while plowing the right hand rear wheel runs on plowed ground if desired, pulverizing and leveling clods or hard ground better than six operations with a harrow.

—it will do more in a given time and at less expense, and is adapted to a wider range of work than any other auto tractor.

—every pound moved requires power. Minimum weight means low operating cost. Excess weight is not essential to traction and diverts power from useful work to dead loss.

—the PONY adds only 95 pounds to the weight of a Ford, from 500 to 1300 pounds less than other auto tractors, which is a big factor, especially on hills or soft ground. The power wasted by heavier machines moving their own useless weight, the PONY applies to the load being moved.

—also other tractors having clumsy, quickly-worn cast gears which grind themselves out running dry in abrasive sand and grit, waste still more power. The PONY, having no wearing parts, applies this power to useful work. It also saves the expense and delay of replacing worn parts.

## A Real One Man Tractor

An efficient lever operated from the driver's seat raises and lowers the plow at will, enabling the operator to back, turn square corners, cross ditches or checks, or carries the plow clear of the ground as far as desired.

As the operator rides in comfort out of the dust, and sun too if desired, he can work much longer hours than when walking and urging a tired team.

Forged steel clevises hold a walking plow in the furrow without attention from the operator. Simply drive where you want to plow, and the PONY does the rest.

### The Vital Test

Your wagon will not last as long, and your team cannot haul as much hay, or haul it as cheaply, with half a ton of useless iron in the wagon, and the wearing parts running in grit instead of grease; neither can a tractor.

The PONY is built close to the ground and powerful. The low wheels give greater strength, pulling power, and stability on hillsides than is possible with larger wheels and heavier weight.

Double production without increased expense. The PONY takes a two horse implement twice as far in a day, and at half the cost of animal power, doing better work by reason of its speed.

Any one who can drive an auto can operate the PONY, though unable to follow a team.

The PONY can plow four acres where an ordinary team can plow two. It goes twice as fast as a team and turns the ground bottom side up instead of standing it on edge. It harrows, mows or rakes twice as much per hour as a team can and does much better work because of its speed. It goes to distant fields and returns as an auto in one-fourth the time required for teams, and is changed from Ford to PONY in the time required to unhitch from a wagon and hitch to a plow. Few people realize the value of speed with farm implements, and for all the little jobs that a team can do, because heretofore it has not been available. The PONY gives you twice the speed of teams and it does not lag toward the end of the day. It can work all day as a tractor and at night as a pleasure car. "The average horse works only 100 days in the year and his labor costs 12½ cents per hour, while one-fourth of all the land tilled in the United States raises 'horse feed,'" according to the United States Government

figures, and the horse eats the profits when not working. Tractor horse power costs about 3½ cents per hour, and they work whenever wanted. Tractors are not subject to disease, require little room, do not attract flies, and require neither care nor expense when not working.

Replacing animal power with PONY power not only doubles production by doubling speed with the same implements, it leaves the land and time now devoted to feeding and caring for horses available for food crops.

In the qualities that give a tractor real value the PONY has no rival in the tractor field. Don't underestimate the value of the PONY because the price is low. No other tractor regardless of price can do the same work at the same cost. The PONY not only does its work at less cost, it does better work and more of it than tractors selling for two or three times as much.

No money wasted buying cumbersome and useless parts.

No power wasted moving worse than useless weight, or grinding away clumsy wearing parts, which run in grit instead of grease.

No gears to grind, no wearing parts. Does not get out of order. No time or money wasted adjusting or replacing worn parts.

Eliminating so much weight and friction it requires less power to move itself, more power remaining for useful work.

No other tractor approaches it in speed. Two to fifteen miles per hour, according to road and load. The PONY is "Quick on foot."

### POWER AND STABILITY

Its lightness, strength, speed, power, simplicity, durability and economy of operation give the PONY a wide range of usefulness.

It is the first of its kind. A new type. A higher value at a lower price. A whirlwind seller with no comebacks, and a money maker, for both the agent and the owner.

### GOOD TERRITORY OPEN

#### State and District Agents Wanted

Live, energetic, state and district agents wanted to appoint and organize local agents and handle exclusive territory.

Send for circulars.

## 1917 Wheat Prices---A View of World Conditions

Chas. W. Holman of the U. S. Food Administration Writes of Stocks in Hand and Possibilities of 1918 Production. America's Responsibility is Great

THE United States food administration announces the following statement of the relation of America to the world wheat trade under conditions:

win the war first consideration the United States in its food production must be to feed the people within the confines of this government.

The second consideration must be our people to spare as much food products as can be spared to feed our allies, France, Italy, the United Kingdom and Belgium, whose normal consumption exceeds their production.

The third consideration must be to protect American farmers and other neutral parties in the wheat trade from the disastrous losses that might occur from the unprecedented choking of the world's arteries through which wheat ordinarily moves.

France, Italy, the United Kingdom and Belgium under normal conditions export annually 381,000,000 bushels of wheat. These nations have suffered a falling of their productivity as a result of being in the war. They now have a total wheat deficiency in proportion of about 200,000,000 bushels. It will be necessary for them to import within the next twelve months at least 577,000,000 bushels. Russia had an abundance of grain and a vast surplus, if this surplus could be released; Russia cannot move any grain to the Allies in quantities essentially important.

### Isolation of the Allies

Our Allies are isolated from practically all markets except the United States and Canada, as compared with pre-war conditions. The supplies of wheat in Rumania and Rumania are in the hands of the Central Powers. As already stated, the Russian supply is cut off. The voyages from Australia and India are three times as long and require, therefore, three times as many tons of shipping to move wheat as is required from North Atlantic ports. The voyages from India and Australia are also far more dangerous because of longer exposure to submarine attacks.

### Our America's Responsibility

The responsibility for furnishing the Allies this 577,000,000 bushels of wheat fall in no slight degree upon the United States and Canada. The estimated ordinary wheat surplus of the United States for 1917 is 88,000,000 bushels.

Probably the Canadian surplus will be 120,000,000 bushels. This will still leave a deficiency in wheat supplies of the Allies of approximately 369,000,000 bushels. This deficiency is still further enlarged by the fact that the United States must make reservations of wheat for neutral nations with whom we trade and from whom we secure essential products. Such reservations will increase the European deficiency to approximately 400,000,000 bushels.

The way to keep the Allies alive during the war is for us to economize

at every turn, and thereby increase the surplus from the United States to 200,000,000 bushels. This together with shipments from Argentina, Canada and Australia, should supply at least a minimum on which they can live.

### How the Allies Meet their Problem

One might think that the American wheat producer stands in a very safe position with regard to prices but such is not necessarily the case. The Allies, foreseeing their situation, have perfected buying arrangements and shipping arrangements, so that all wheat leaving free ports destined for consumption in any of their countries must be brought through a single agency. Arrangements are being made to liberate in far greater quantities the stored up supplies of India and Australia. Within the last few days Australian wheat has begun to arrive in America, and will continue to arrive in increasing quantities. Other important changes have occurred since the war that seriously undermine the stability of the wheat market and will tend to offset the apparent advantage of the American farmer in the world trade.

### How American Grain Trade Has Developed

To understand this situation, it should be remembered that for the past thirty years the marketing of grain in America has depended for its mobility upon the American system of "hedging." This system has grown out of the peculiarities of grain production. Somewhere a crop of grain is always ripening. Somewhere the weather is expanding or contracting the crop. Cable and telegraphic information reaching the buyer and seller on the open marts has been the basis of their hedging practices which have acted as a kind of insurance to the business. This practice and the unusual transportation facilities of the Great Lakes, have enabled American farmers to expand their wheat acreage, and American business men to develop the wheat industry, notwithstanding the competition of other nations with cheaper production costs and greater grain yields, as against our increasing production costs and lessening acre-yields.

So long as the world was at peace and trading had opportunity to function normally it is doubtful if any flat price could be made or sustained by any single country. Such flat prices would have to be by international agreement, which is almost impossible. But with the disruption of world conditions and the shutting off of the sources of grain supply in some countries, and the tendency to exhaust the grain supply in others, a nation like America may find itself in a crisis whereby it is forced to determine and control the price of this commodity to protect its own citizens.

### Precarious Condition of American Producers

That crisis has arisen. The war has disrupted the world wheat trade.

While our reserves are being exhausted, the reserves of other countries are banking up. For three crops the Russian grain has been held, finding very little outlet, and practically no outlet to European consuming centers. Australia has all of her last wheat crop, and part of the crop before, making a total on hand of approximately 180,000,000 bushels.

Another Australian wheat crop of approximately 100,000,000 bushels will mature in January, and Australia is looking for a market. To find this market Australia has removed her wheat and flour duty, so that this wheat can now move into America, in so far as the limited number of sailing ships available will permit.

India has a surplus on hand of approximately 100,000,000 bushels with this harvest. This wheat is locked up because of transportation difficulties.

Although last year's crop conditions were bad in Argentina, there is a greatly expanded acreage, and by January next, when her crop begins to move, Argentina should have a surplus of 150,000,000 bushels.

The American people are practicing economy as recommended by the food administration, and there is a likelihood that our 88,000,000 bushel surplus may be expanded to 200,000,000 bushels to be added to Canada's surplus of 120,000,000 bushels.

### Flood of Grain

That wheat from Australia, India and Russia, is awaiting exportation, restricted only by limited transportation facilities. If the war should end immediately this enormous surplus would be turned loose upon the world, flooding the markets. The war foundations of high prices would be knocked from under American wheat growers, because the normal export requirements do not exceed 600,000,000 bushels.

### Weakened Financial System

Again, the operation of the export embargo and the elimination of exchange trading in wheat futures, has taken the underpinning from the financial system which for 30 years has been trained to understand that a loan on wheat purchased by contract was a good security because the hedging system would offset any value depreciation should the market fall.

Without governmental aid the American farmer would be in a position of greater insecurity in the future than ever before in the history of this country. The danger to the farmer would be more acute because his costs of production have risen enormously during the war, and the ordinary organization of the business world would be powerless to prevent the possible decline in wheat values irrespective of the costs of production, and losses, would be enormous. This might disrupt the entire commerce of the United States and bring about a condition of financial insecurity.

### Protecting Producers and Consumers

To protect the public congress has

constituted an agency to step in between the central purchasing agency of the Allies and the unorganized American farmers. Congress has constituted a food control, placing this control in the hands of the President of the United States, and the President has designated the food administration to administer this work. The food administration now proposes to act for the American people to protect them in the matter of price and to provide the necessary financial guarantees to buy and store the crop of wheat on hand in 1917 at fair prices; to deal with the Allies, giving them only such surplus as can be spared; and to control the margin of profit among trading, milling, baking and distributing factors, to the end that feeds may be conserved for American farmers and cheaper bread and flour may be had by the American consumer. Congress has also made an appropriation of \$150,000,000, to enable the food administration to finance its operations. The food administration will operate without profit, putting only the actual cost of operations as its charge for the handling of the wheat crop.

### Fair Price Commission

In order to finance this undertaking and to supply our Allies, a fair price for wheat must be determined as the beginning of this work. Accordingly, the president of the United States has appointed a commission to ascertain what should be a fair price for the 1917 wheat crop. On this commission are represented farmers, consumers and the public at large. The members consist of H. A. Garfield, president of Williams College, chairman; Charles S. Barrett, president Farmers' Union, Union City, Georgia; William N. Doak, vice president Brotherhood of Railroad Trainmen, Roanoke, Virginia; Eugene D. Funk, president National Corn Association, Bloomington, Illinois; Edward F. Ladd, president North Dakota agricultural college, Fargo, North Dakota; R. Goodwyn Rhett, president chamber of commerce of the United States, Charleston, South Carolina; J. W. Shorthill, secretary National Council of Farmers' Cooperative Associations, York, Nebraska; Jas. T. Sullivan, American Federation of Labor, Brooklyn, New York; L. J. Tabor, master Ohio State Grange, Barnesville, Ohio; Frank W. Taussig, chairman Federal Tariff Commission, Washington, D. C.; Theo. N. Vail, president American Telephone and Telegraph Company, New York City; Henry J. Waters, president Kansas state agricultural college, Manhattan, Kansas.

It will be the duty of this commission to make a thorough inquiry into the costs of producing wheat, costs of milling, distributing, baking, etc. When its inquiry is completed and analyzed this body will announce the basic price at which the wheat will begin to be bought. This price will take into consideration not only the costs of production, but also a reason-

## The Drying of Figs

By I. J. Condit

**D**RIED figs in California are made mainly from three varieties, the Adriatic, the Smyrna, and the Mission named in the order of their present importance.

The first crop of the Mission fig is generally sold fresh but may be dried, and at present prices the dried product may be the more profitable of the two. The second crop is mainly dried but on account of the black color of the fruit does not command as high a price as that of lighter figs. The Mission figs drop to the ground when mature, are picked up shortly after and dried on trays in the sun. No further treatment is generally necessary.

The second crop of the Adriatic and Smyrna is the only one of sufficient size and importance to be of value for drying. The limp and partly dried figs drop naturally or are lightly shaken from the tree and are picked up within three or four days since an inferior product results from too long exposure to the effects of sun, dust, and insects. The figs are hauled to the drying yard and spread on trays, after which the Adriatics are sulphured to bleach the skin and improve the

appearance. Sulphuring in lug boxes is often practiced but does not give as uniform or as good results as on trays. Smyrnas which are properly handled should not require sulphuring. Adriatics are dried in direct sunlight from one to three days depending upon the heat and humidity, while Smyrnas are best dried by stacking the trays one above the other so as to allow free circulation of the air between. Over-dried figs become tough, woody, and inferior. After sorting out the bird pecked and split fruit the figs are dumped from the trays into perforated boxes or containers, washed for 20 minutes in cold water containing four ounces of salt to the gallon of water, and again spread out for a final drying of half a day in the sun. They are then placed in piles on a clean floor or in sweat boxes, where they are allowed to go through a sweat for about two weeks, being turned with a shovel two or three times during that interval. Sweating equalizes the moisture and gives the product a better texture. The figs can then be stored for packing or sent to the packing house, care being taken in either case to prevent infestation by insects.

## Drying Sulphured Fruits

By R. Schmidt

**A**PPLES for drying should be thoroughly ripe, but not soft. They are usually pared, cored, and cut crosswise into slices about one-fourth of an inch thick. These slices are spread in a single layer on the trays and then sulphured for about 20 minutes and immediately set to dry. Apples are sufficiently dry when the slices separate after being pressed firmly together. They should be soft and velvety to the touch. They keep well if packed in boxes lined with paraffin paper.

### Pears

Pears are picked when the stem separates easily from the tree on lifting the fruit. They are placed on straw in boxes or bins to ripen to good eating condition which requires about ten days. They are then cut into halves or quarters, the stem and calyx removed, but not the core, and placed on trays.

The fruit on trays is then sprinkled with water and sulphured for at least 18 hours. Four to five pounds of sulphur are needed for the home sulphuring box. The sulphured fruit may be completely dried in the sun, but a better product is obtained if it is left in the sun for one or two days only and the drying finished in the shade. The finished fruit should be leathery, not brittle.

### Apricots

Apricots should be hand picked

from the trees, but sometimes are shaken off on sheets. They should be ripe but not very soft. They are halved and pitted. The halves are placed, "cupside" up on trays and sulphured for two or three hours. When sufficiently sulphured juice collects in the cup and care must be taken in handling to prevent spilling. The fruit should become a golden yellow, not brown, on sulphuring.

The trays of sulphured fruit are then placed in the sun. In hot weather the trays should be stacked before the fruit is quite dry and finished in the shade. When finished they should be leathery, not hard nor brittle. If allowed to become too dry they may be placed in a perforated vessel and dipped for a few seconds in boiling water. They are then spread out until the surface is dry and then packed in sacks or boxes.

### Peaches

Peaches should be gathered when slightly soft over the entire surface and sulphured as soon as possible after cutting and pitting. The methods are the same as for apricots.

For peeled peaches the skin can be removed by the fingers after sulphuring or after cutting and pitting by dipping in boiling lye (one pound of lye to ten gallons of water, and then immediately in cold water.

Other fruits which may require sulphuring are grapes, White Adriatic figs and Silver prunes.

## Drying Muscat Raisins

By Frederic T. Bioletti

**T**O make good Muscat-raisins, very sweet, large grapes and two or three weeks of hot, dry weather are necessary. These conditions occur in the interior. Nearer the coast the weather is usually cool and rain prob-

able by the time the grapes are sufficiently ripe.

The riper the grapes the better the quality of the raisins and the heavier the yield. They should have at least 25 per cent of sugar. The drying ratio varies with ripeness from 5:1 to 3:1.

At 25 per cent Balling 3.4 pound of fresh grapes yield one pound of raisins. The time of drying varies from nine days to thirty, according to weather. The most favorable minimum daily temperature for qualities between 80 degrees and 90 degrees Fahrenheit. At much above degrees the drying is quicker but quality inferior. Showers and weather may prolong the drying beyond 30 days.

The grapes are gathered directly on to 2x3 foot trays and dried between the rows of vines. The yard is first prepared by making a low soil ridge slanting to the south and near the south side of every alternate row. If the growth of vines is very heavy it may be necessary to cut away the ends of the spread canes.

Each tray receives 22 pounds of grapes, evenly spread and free from trash and leaves. When about three-fourths dry, the grapes are turned. This is in about nine days at an average maximum daily temperature of 90 degrees Fahrenheit. Two men the turning by placing an empty tray on top of the full one and revolving both from north to south, so as to change the position of the grapes well as turn them. After about three or four days at this temperature, raisin trays should be "stacked" in piles of ten or more; each pile being covered with an empty tray. It is advisable to do as much of the drying of the stack as is possible without running the risk of molding.

In case of threatened rain the trays are also stacked and then spread out again when the danger has passed. A little rain will not hurt the raisins before they are turned. Much rain, wetting after turning, will injure the appearance as layer raisins, but this can usually be saved by prompt turning on to new dry trays. In case of prolonged wet weather, it may be necessary to sulfur the stacked raisins. This is done by covering the stacks with a sheet or a balloon sulfur, and burning a few ounces of sulfur. When dry, the raisins are packed tight into sweat boxes 2x3 foot x 18 inches deep, holding about twenty-five trays. For home use, bins or boxes of any size may be used. Desiccated raisins are packed in layers separated by sheets of Manila paper.

This method can be used for drying other grapes though it is preferable to "dip" in some cases.

### CITRUS DERELICTS

**A**SERIOUS menace to the advancement of the citrus industry in the state and a factor that is giving the state plant board no end of trouble in its tireless effort to keep insect pests and diseases under control is the abandoned grove. The parasites of the citrus industry are to be found all over the state. In most cases they are absolutely worthless and will never be otherwise. At breeding places for pest and disease they serve admirably. Citrus canker will make the abandoned grove her final stronghold; here the dreaded disease may lie dormant for many months, a constant danger to surrounding groves. Often the owners of these groves are unknown; yet the law will not permit the destruction of the trees without a permit from the owner. The derelicts of the sea are hunted out and destroyed. Why not these derelicts of the citrus industry? They are certainly an eyesore to any community and in many instances serve to misrepresent the

territory to the prospective homeseeker and capitalist alike. These former groves are living monuments to failure. It is only natural that they should shatter the confidence and shake the faith of the newcomer. In many cases the fault lies with the man and not with the land or its location. Too often the attempt is made to engage in citrus culture with insufficient capital, and a limited knowledge pertaining to the work. Common sense and capital are two very necessary requirements in almost any line of endeavor and

the business of growing citrus fruits is no exception. Perhaps if these abandoned groves could tell their individual stories it would be clearly proven that it was the lack of common intelligence, judicious management and sufficient capital that brought about their present condition. A state law that would permit the plant board or any other recognized authority to destroy abandoned groves whenever found, either with or without the consent of the owner, would certainly be a credit to the legislature that passed it. — Florida Grower.

## Testing Sugar in Grapes

**S**TANDARDIZATION of fruits is demanded more and more, and now it is becoming a legal as well as an economic question. Determination of sugar content is comparatively simple for the chemist. We note in the Human News description of methods of ease of determination, by H. H. Jackson. From this we quote:

The ripeness of any fruit is usually expressed in the amount of sugar it contains or the ratio between the amount of sugar and fruit acid. We know a fruit is ripe when it has a high enough sugar content to taste sweet. However, sugar content is more important to the grower than the mere fact that it makes fruit taste sweet. High sugar content makes fruit weigh more, and so gives tonnage, especially with dried fruit.

Men who watched the raisin drying fall will remember that the ripest grapes dried the fastest and weighed the heaviest. Time was not saved by picking grapes green, since it took longer to dry them. A high sugar content makes them dry faster.

The fruit standardization law requires that grapes for interstate shipment should show 17 degrees Balling and 16 degrees in the case of Emperor. The Balling degree represents the pounds of solids in 100 pounds of grape juice. As this is nearly all sugar, it is often called the "sugar degree of percentage."

The Balling saccharometer is a glass spindle with an enlarged bulb at the base. The spindle is graduated in terms of "Balling" degrees. It reads the per cent of sugar in grape juice direct, and is so simple that anyone can determine the sugar content of his grapes in a few minutes.

Select four or five bunches in the vineyard from different parts of the vine so as to get average conditions. Crush the juice and strain through a cheesecloth. Place the strained juice in a long glass cylinder which is about two inches wide. Float the long bulb of the saccharometer, bulb down, in the juice. The more sugar in the juice the heavier it will be and the less the saccharometer will sink into the juice—the less sugar, the lighter the juice and the deeper the tube will go into the liquid. The per cent of sugar can be read direct by reading the Balling scale on the tube of the saccharometer. For instance, 20 degrees Balling means 20 per cent sugar in the grape juice.

The general level of the liquid is read in reading the height of the scale. The temperature of the liquid should be 60 degrees Fahrenheit (ordinary thermometer). For every 30 degrees above 60 degrees you add one degree of sugar to the reading given by the saccharometer. This is caused by the tube sinking a little too low in the warm liquid to give the correct per cent.

The interstate law does not consider shipping grapes ripe until they show a sugar content of seven degrees Balling, with the exception of Emperors, which need only 16 degrees Balling. Grapes for raisins will increase in sugar and give an increased weight until the skin begins to shrivel. In practice Thompsons should be picked when they show 24 per cent to 26 per cent sugar, as then they will give a maximum weight and at the same time are not ripe enough to drop very bad in picking.

Since sugar content is so important in determining the weight of both the green and dried grapes, I believe it would pay every grower to own and use a saccharometer. A few degrees difference in sugar content makes a good many pounds difference from ten acres of Thompsons.

\* \* \*

Druggists or dealers in chemists supplies can supply the saccharometers and other necessary appliances.

### MORE FARM ADVISERS

**T**HANKS to the passage of the emergency food production bill by congress there will be an additional sum of \$104,000 per annum available for extending farm adviser work in California. Governor Stephens has called a conference in Sacramento on Monday and Tuesday, September 10 and 11, at which plans will be laid for the extension of the farm adviser system to most of the agricultural counties of California. To that conference will be invited the members of the state council of defense, chairmen of county councils of defense, chairmen of county boards of supervisors, presidents of county farm bureaus and farm advisers.

Then 19 counties which have already organized farm bureaus and obtained county farm advisers have found that the system has resulted in great service to the prosperity and wellbeing of the county. Already farm advisers are at work in the following 18 counties: Alameda, Fresno, Glenn, Humboldt, Imperial, Kern, Madera, Merced, Napa, Nevada, Placer, Riverside, Sacramento, Solano, Stanislaus, San Diego, San Joaquin and Yolo. The privilege of obtaining a farm adviser is now, thanks to the new congressional appropriation, offered to San Bernardino and Tulare, which have already organized their farm bureaus, and to the following 19 other counties: Butte, Colusa, Contra Costa, Eldorado, Kings, Los Angeles, Monterey, Mendocino, Orange, Santa Barbara, Santa Cruz, San Luis Obispo, Shasta, Siskiyou, Sonoma, Sutter, Tehama and Ventura.

Funds are immediately available for the expansion of the farm adviser system, so it is expected that within a

few months 39 different California counties will actually have farm advisers at work, and a complete and unified system of farm organization.

### TO BE SURE

"We can all do something to help."  
"Yes, those who can't do anything else can sit back and advise the rest."

### AGRICULTURAL STATISTICS

We note the publication of "Agricultural Statistics", published at St. Louis, Missouri, containing the greatest mass of figures regarding agricultural affairs of the United States of any publication we have seen. It is issued quarterly at 25 cents per copy.

## An Orange Grove Pest

By S. A. Cook

WRITER in the Journal of the department of agriculture of Victoria, Australia, refers to a new pest of the citrus orchards of that state. He

says:

A pest noticed in various orange groves in this state since December last, and which has now become very troublesome, has been identified by the government entomologist, C. French, Jr., as the light brown apple moth, *Cacoecia* responsible. From my own observations it would appear that its method of attack on the trees is as follows:

The eggs are laid on the rind of the fruit as well as on the leaves. The tiny caterpillar on emerging from the egg attacks the rind of the orange, generally where there is a leaf overlying and in contact with the fruit or where two or more oranges touch in a cluster of fruit. The caterpillar does not, as a rule, make its way into the orange immediately, but gnaws along the rind and eventually bores into it and feeds, to a slight extent, on the pulp, in which it forms a cavity under the rind. In any case whether the rind is bored into and through to the pulp, or only furrowed on the exterior, premature ripening

of the fruit ensues with a consequent weakening at the stem, and it falls in a semi-ripened condition. The caterpillar then emerges from the fallen fruit and enters the soil to go through a metamorphosis. The moth is about three-fourths of an inch in expanse of wings, and the upper pair are light brown in color and slightly barred while the under set vary from lighter brown to fawn without markings. The caterpillar when fully grown is about three-fourths of an inch in length and is of a light-green color.

The pest should be controlled as follows: Spray the trees thoroughly when the foliage is dry, with arsenic of lead, using a good pump with strong power behind the nozzle, so that the spray may be forced into the interstices and over every part of the tree, and the fruit clusters thoroughly covered with the poison. All fallen fruit should be picked up daily. The soil around the trees should be frequently stirred with a light cultivator so as to disturb any caterpillars which may be lurking there.

In view of the great expansion of our citrus industry and the serious depredations of this pest, every effort should be made by growers to combat it.

## Grapefruit in California

CONTINUING Prof. A. D. Shamel's address on the grapefruit situation in California we quote that portion of it which has to do with:

### Distribution of Plantings

According to Vaile in his discussion of the "Outlook for the Pomelo," 600 acres of grapefruit trees are in bearing in California, 1915, from which 250 carloads will be shipped and marketed this season. One thousand, one hundred additional acres of trees are under five years of age, from which it is estimated the California output will be more than doubled in the coming five years.

Further, Vaile states in this report that Florida has some 16,000 acres of full bearing grapefruit trees, from which this season about 8000 carloads of fruit will be shipped. In addition to this large planting Florida has about 45,000 acres of grapefruit trees between the ages of one and five years which in the next five years should produce a crop of about 35,000 carloads.

Porto Rico in 1913 exported to the United States 216,216 boxes of grapefruit, or about 500 carloads, estimating 400 boxes to the car. Cuba in 1912 exported to the United States the equivalent of about 250 carloads of grapefruit. In both Cuba and Porto Rico there are reported to be large new plantings of grapefruit trees so that the export of these fruits to the United States and elsewhere is likely to increase greatly over the past records. A comparatively small but rapidly increasing export of grapefruit to the United States from Jamaica and some other foreign grapefruit growing sections is evident from the observations and figures available for study.

Vaile offers the following comment on the grapefruit situation in California in consideration of the conditions in other grapefruit districts which compete with the California product:

"The grapefruit situation in California is on a reasonable and sound basis at present. It may be expected that the industry will be as profitable as any for a period of years . . . . It would strongly suggest that future plantings be very conservative. Do not hesitate to recognize the wisdom of seeking new acres adapted to the crop, and we sincerely deplore the commercial boosting of large tracts of new lands for grapefruit culture."

At least two facts must be remembered in considering this discussion. First, that Florida or foreign grapefruit is no longer admitted into California on account of the danger of the introduction of insect pests and fungous diseases through this means. No doubt other Western states where grapefruit is being grown will soon or later adopt similar protective measures, so that the population of these states and their Eastern neighbors will have to be supplied with home grown grapefruits. Second, the period of ripening of California Marsh Seedless grapefruit is during the summer months when no other known district has ripe crop available to supply the great Eastern markets. For these and other reasons California has an opportunity to develop a strong grapefruit industry, in the opinion of the writer providing only the best possible grade of grapefruit is produced and the fruits allowed to ripen before picking. The green, bitter and strongly acid fruits often found on the market under present conditions offer a strong argument for the establishment of a standard of ripeness for grapefruit by the growers, as has been done for oranges. For their self protection growers should look into this matter carefully and from an unbiased point of view and squarely face the consequences to the future of the industry of a continuation of the present unfortunate and uncontrolled system of marketing California grapefruit.

## Oranges Quarantined

Quarantine order number 28 of the Federal Horticultural Board prohibits the order of the secretary of agriculture, the importation into the United States from eastern and southern Asia (including India, Siam, Indo-China and China), the Malayan archipelago, the Philippine Islands, Oceania (except Australia, Tasmania and New Zealand), Japan (including Formosa and other islands adjacent to Japan), and the Union of South Africa, of all species and varieties of citrus fruits excepting only oranges of the mandarin class (including satsuma and tangerine varieties), except for experimental or scientific purposes by the department of agriculture. Oranges of the mandarin class (including satsuma and tangerine varieties), but no others, may be imported from the countries and territories above named but only under regulation.

Those contemplating the importation of oranges which are permitted, noted above, must make application for permits on forms provided for the purpose by the federal board of horticulture at Washington, giving

various information required in the application form, and must accompany the shipment with a certificate issued by an official of the country from which the oranges are exported, showing that they have been inspected and found to be free from visible infection with citrus canker, etc. All such oranges also must be reinspected upon arrival in this country.

### GROWERS' MEETINGS

The San Antonio Fruit Growers' Exchange announces annual meetings for Associations as follows:

Indian Hill Citrus Association—September 1.

La Verne Orange and Lemon Growers' Association—September 4.

Claremont Citrus Association—September 5.

Pomona Fruit Growers' Exchange—September 6.

El Camino Citrus Association—September 7.

Walnut Fruit Growers' Association—September 15.

San Antonio Fruit Growers' Exchange—September 11.

## Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unanswered communications receive no attention.

### Black Alkali

Would like information as to the method of neutralizing black alkali in the soil. Have been advised to use gypsum. Would this have the desired effect?—Subscriber, Mecca.

Gypsum will change your black alkali to white alkali, which may be dissolved and washed from your soil. Providing heavy irrigation can be given and you have a subsoil which drains the water away. The white alkali is less caustic, and after heavy irrigation some crops might be grown which would not grow in black alkali. Gypsum may be applied at the rate of a ton to the acre, but there is no harm if heavier application than this is made. For a very heavy sub-

soil, which provides satisfactory drainage, it is possible that an artificial drainage system might be necessary in order to give entire use of such land.

### Poplar Tree Pest

About a year ago I cut down and grubbed out a number of 20-year-old poplar trees. This summer nearly all the lateral roots have started to grow. I have been keeping them cut back as fast as they grow. Will these roots eventually die or how could I accomplish their destruction? It is not practical to grub them out entirely for the reason that they extend under orange trees.—Subscriber, Santa Ana.

Presumably these sprouts are coming from the ends of various roots which have been cut or plowed off and within a short time the continual sprouting will cause their death. It would not be possible to use any chemical to poison the soil without possible injury to the orange roots. The closer the growth is kept cut off the sooner the roots will be subdued.

### Keeping Prunes

What is the best way to keep dried prunes through the winter?—Subscriber, Loomis.

The first step is before drying, that is, do not dip in such strong lye or hold in the lye so long as to destroy the skin so the prunes will sugar after drying. When properly cured with good whole skins the only precaution necessary is to keep from insects. In a dark place sacks may be sufficient, but it is better to have in tight bins where insects may not enter. They may be kept perfectly by putting in glass or tins, sterilizing by raising the heat in the oven, or otherwise, for several minutes.

### Doe Too Fat

My hornless black and tan colored goat, which has dropped kids twice and gave about two and one half quarts last time (March 19), has now dropped off to about one and one half quarts. She is very fat but has a great appetite especially for concentrates. I feed her alfalfa by tying her out in a field and then give about two-thirds of a quart night and morning of beet pulp and coconut meal

## Use "REMCO" MACHINE BANDED REDWOOD PIPE FOR IRRIGATION

"REMCO" MACHINE BANDED REDWOOD PIPE is in use in hundreds of Irrigation Systems throughout the state of California and is giving thorough satisfaction. Made from CLEAR, AIR-DRIED REDWOOD, carefully selected, and best grade pipe winding wire, it will outlast any other pipe except castiron.

### EVERY FOOT OF PIPE GUARANTEED "Remco" Redwood Tanks and Silos

### To Be Known For Its Goodness

That is our uppermost thought in placing our standardized alfalfa seed on the market in such a manner that there can be no question of its identity.

#### THAT IS

Why we have spared no expense or trouble in having our entire supply of seed field selected by an expert in this line.

Why we personally supervise each shipment, from growing field to customer, with as painstaking care as though it were for our own use.

Why we refuse to handle any but pure, fresh seed, grown by specialists in sections particularly adapted to seed culture.

Why, hereafter all seed purchased of us will be in containers bearing our firm name and the trade name

#### GREEN-GOLD BRAND ALFALFA SEED

This Means that there is no longer any guess work in alfalfa seed buying. That a responsible firm, whose sole product is alfalfa seed, has taken the cares and worries of poor seed off your shoulders. And It Costs No More because of our plan which eliminates all middlemen.

Write today for prices and samples of new crop seed, stating probable requirements.

is doing much to conserve labor in these trying times. Mounted on a potato digger, two horses can do the work of six. In the delta lands, a potato harvesting crew does three times as much work as formerly. This engine can be used for any other kind of farm work, being especially adapted for pumping, sawing, running grinders, small bean threshers, seed cleaners, washing machines, etc. Weighing but 167 pounds it can do any work from 1 to 5 H. P. It has a throttling governor and a very wide range of speed. Hundreds have been used on rice and grain binders, headers and reapers to save horses and make work easier. Information about them can be had by addressing the factory representative,

When writing advertisers, mention the Cultivator.

soaked. The volume when soaked is two-thirds of a quart. Should I breed her again and, if so, will she drop off in milk rapidly? Is this tendency to fattening a bad one or is it my fault?—Subscriber, Rosamond.

This question was answered by Martha Howland:

I would suggest he cut down the concentrates, especially the cocoanut meal and beet pulp. Evidently the doe is not a heavy milker, but the gradual falling off in her milk is natural. She could be bred all right when she comes in heat, but it would be best then to gradually put her on a ration of rolled barley and bran, say a pint of each mixed together, given in two feeds, night and morning. If she shows great preference for the beet pulp, that could be added to her grain ration after she freshens again.

After being bred again she should be milked just as usual, for two months at least, or until she shows an inclination to go down in her milk. If she shows a tendency to dry after being pregnant about two months, as

indifferent milkers are likely to do, then gradually dry her off. And be careful at the next freshening to milk her regularly and cleanly so as to correct the tendency to turn her food into fat instead of milk.

#### Breeding Goat

A white goat, that I am milking was fresh in July of 1916 but seems to give the same pint night and morning that she used to give. She is just good and plump but cares little for the beet pulp though she does like rolled barley. Should she be bred now?—Subscriber, Rosamond.

This question is answered by Martha Howland:

It would seem best to breed the white doe as early in the season as possible, for if she passed another season without freshening she might form the habit of not breeding, which sometimes happens with animals that are allowed to go empty for a year or more. The same grain ration should be given to this doe as is given to the black and tan colored doe.

## How to Control Tuber Moth

THE state council of defense sends out the following:

The attacks of the potato tuber moth may be reduced almost to a minimum by cultural methods to prevent infestation. Also, infested tubers may be treated so as to kill the insect and prevent further injury. Here are the chief preventive measures:

A thorough working of the soil to reduce clods and prevent the entrance of the moths into the ground to the tubers.

Deep planting, from five to six inches, and subsequent hilling to insure complete covering for the developing potatoes.

Early harvest, just as soon as possible. Ripe potatoes if left for any length of time almost invariably become infested before digging.

The immediate removal of all potatoes from the fields as soon as dug, to prevent infestation.

Marketing the crop as early as possible.

Storage in clean, tight bins or store-rooms.

Here are some remedial measures to use if the crop has already become infested at the time of digging or afterwards:

Carefully sort potatoes and place those apparently free from infestation in clean, tight bins for future treatment if necessary.

Inspect all potatoes before shipment and fumigate all if any evidences of the potato tuber moth are found.

Place all infested potatoes in tight bins or storerooms and fumigate with carbon bisulphid — two pounds to a thousand cubic feet of space for forty-eight hours. The fumigant may be poured into shallow containers and placed on the top of the potatoes. The liberated gas, being heavier than air, will find its way downward to all parts of the rooms. The carbon bisulphid is inflammable and explosive so that great care should be exercised to keep lights away from places of fumigation.

## Exterminating Ground Squirrels in National Forests

In line with the food conservation measures of the government the United States biological survey is waging a campaign of extermination against the ground squirrels on the national forests of California, according to the forest officers. Seven crews of squirrel poisoners, comprising about 30 men, are at work on the Sierra, California, Santa Barbara, and Sequoia forests. As funds become available the work will be extended to grazing areas in other forests. "The amount of grain and stock food destroyed by ground squirrels is almost incalculable," declares Wm. C. Jacobson, representing the bureau of biological survey for California. "The extermination of these rodents will ordinarily increase the stock carrying capacity of a range 10 to 25 per cent. This work, therefore, takes on more than ordinary importance at this time of shortage in food supplies."

Poisoning the squirrels through the placing of grain impregnated with strychnine near the burrows and runways is the method commonly used. When this becomes ineffective, the squirrels are "gassed." An explosive poisonous vapor heavier than air is poured or pumped down the squirrel

holes. One application is usually sufficient. In wet weather, or when no danger of setting the forest afire is present, a match is touched to the mouth of the burrow and the gas exploded.

#### AT THE RIVERSIDE FAIR

The idea of food conservation and food production is paramount in the plans for the fifth annual Riverside County Fair, October 9-13. A special exhibit will be sent from Washington to portray the work of Food Administrator Hoover. There will be also displays and demonstrations by the great food manufacturers of the country. The alfalfa growers will have a special exhibit at the fair. Here they will serve delicious alfalfa sandwiches and salads. In the stock department will be the first show of goats in Southern California. Samples of goat milk and butter will be distributed. Exhibits of animal feed and vegetables will be housed in a large tent. Here demonstrations will be made. The demonstrators will answer questions pertaining to foodstuff production and explain up-to-date methods of planting and cultivating and advise how best to combat diseases.

# Poultry can be made to Pay

**T**HERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

## Poultry for Profit

BY

**Jean A. Koethen**

Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on egg-shell book, binding full cloth vellum de luxe.

## Reo Quality is Uniform in all Reo Models

AND REO QUALITY at Reo Prices and backed by the Reo guarantee, constitutes "The Gold Standard of Values"—each model in its class.

WE SHOW HERE SIX Reo Models, comprising Fours in Touring and Roadster types; Sixes in Touring and Roadster; and the two Reo Commercial Vehicles—the 3/4-Ton "Speed Wagon" and 2-Ton "Heavy Duty" Truck.

IN THIS ADVERTISEMENT we have space only for a brief paragraph pertaining to each Model—lest you forget the line is so complete that you can find the car you desire, in the type you prefer, and in a Reo.

REO THE FIFTH, "The Incomparable Four," is America's most famous automobile. Standard in practically its present form for now eight seasons—"going on nine." At its present price, \$985, this car is verily "A gold dollar for ninety cents."

TO REO THE FIFTH more than to any other, is due the movement that is now so apparent—the return to the Four-cylinder type in all cars listing at less than \$1000.

THE FOUR IS THE ULTIMATE type in that price class. Economy of upkeep, as demonstrated by this Reo model, has done much to prove the superiority and ruggedness and economy of the Four in that class of car where the buyer must count the cost and yet demands the service and the roominess.

THE FOUR ROADSTER is the handsomest model of its type you'll see on the road—at any price. And, for the present, you can get it for \$985 and freight from the factory.

OF THE SIX ROADSTER the same is true, plus the extra luxury it affords the owner at the extra cost—\$1385 f. o. b. Lansing.

THESE TWO ROADSTERS are of similar design and identical construction, and are conceded to be the handsomest cars of the type—price aside.

FOR THE FAMILY that needs a car of greater capacity than five and yet of moderate upkeep, the Reo Six Touring Car—also \$1385 for the present—knows no equal.

NO MATTER WHAT YOU PAY you cannot obtain a 7-passenger car of better design; one that represents sounder engineering; more experience; better materials and workmanship than enter into the making of this Reo Six.

THAT'S A BROAD CLAIM, but we make it unhesitatingly—and you know that the word of Reo passes at par everywhere.

OF THE REO MOTOR TRUCKS the same is true. The 3/4-Ton "Hurry Up" Wagon at \$1,125 (chassis \$1050); and the famous 2-Ton Reo "Heavy Duty" Truck at \$1800—each is the leader in its own class—demand greatly in excess of factory capacity.

BUT THAT IS TRUE of all Reo models, without exception.

THAT'S WHY WE SAY "Reo Quality is Uniform in all Reo Models," the uniform over demand for all Reo models justifies the statement.

ORDER NOW if you'd have your Reo soon. Present prices obtain only from day to day, and are subject to increase without notice.

## OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

## THIS WEEK'S COVER

A look in at some of California's monster warehouses at this harvest season gives an idea that California is a vital force in the world's munitioning. We have heard of the unbounded prosperity of the Eastern munition factory sections, but the prosperity comes westward slowly. When these great warehouses are emptied it will mean much for hungry Europe and much for California's prosperity. The state has responded nobly to the call to produce more, and preparations for the 1918 crop are being pushed at this early date with such vigor, that next year's production should be the greatest ever.

This warehouse is located near the city of Stockton in San Joaquin County.

## FARM LOAN APPRAISEMENT

Orchardists of Southern California are to meet this week in Pomona to discuss the matter of valuations of lands on which applications have been made to the farm loan bank for federal loans. An association is to be formed to look after the interests of the producers and secure a fair adjustment of this vexed question of valuation.

## FAIR NUMBER

Next issue will be state fair number. The state fair this year promises to be the biggest and best ever. Hence the Cultivator, to be a worthy number, must be the biggest and best ever. More, it will be, for already matter is in hand showing this issue to be the greatest in number of pages, and, we believe, in interest of any Cultivator ever issued. It will have to do with the coming fair. The issues of September 15 and 22 will have more regarding some of the good things which are expected.

## A GREAT PROJECT

The Pine Flat \$9,000,000 project is becoming more and more tangible. Permanent organization has been effected, with George C. Roeding as president, H. A. Ross as vice president and Louis C. Hill, a Los Angeles engineer, making investigations. It is to be hoped that great things will be done. The plan contemplates bringing together several existing irrigation organizations and the investing in addition of \$9,000,000 in dams and reservoirs in Eastern Fresno County. The waters will cover more than a million acres of lands.

## NEW INSECTARY

A wire from Sacramento announces that the governor, with the state board of control, has approved of the use of sufficient state funds to equip and start the work of the state insectary recently established by State Horticultural Commissioner Hecke in Los Angeles County. Citrus growers have been hoping for much of value from this insectary, and the appointment of Mr. Claussen of the United States department of agriculture to take up some special work in Southern California and to have charge of this insectary was considered a long step in advance. Later it was stated that Mr. Claussen contemplated service in the trenches. But it is now announced that he will remain with the work which will prove even more important, and will soon be in charge of the insectary work at Alhambra. Credit is due to the governor and the board of control for investigating the needs of the citrus growers and encouraging this important work.

## HOOVER AND THE FARMER

Herbert C. Hoover invited editors of farm papers to confer with him in Chicago last Saturday. Many editors of farm papers were present and learned from Mr. Hoover of his aims. He frankly stated that he wished the aid of the farm papers of the country to convey to producers a correct impression as to efforts of his commission. In the first place, he deprecated the use of the word "control" in reference to food conservation and marketing. His only effort is to secure as little waste in consumption and as great production of staple foods as possible. If the farmer felt that he was being urged to produce more in order to give the food speculators additional power and opportunities, or even to provide additional food for consumers, if his productions are to be priced arbitrarily, he would surely be justified in rebelling at food control. One farmer who had been "against Hoover" because of his fear that unjust price regulations might obtain found that impression was "all wrong; that the food administrator intended to protect the farmer against a lower price than was his due."

## ADVICE TO FARMERS

"It is doubtful if anyone has ever been so deluged with advice as the American farmer within the last half dozen years. His economic status was much in the world's eye just before the war. The outbreak of hostilities emphasized his importance anew, and with the entrance of the United States into the conflict our people began to realize as they never had before how necessary is his service to the common welfare. At once public speakers and newspapers be-

gan to urge him to do more than ever, and even to tell him how to do it.

"The ordinary man too often cherishes a notion that farming is within the reach of anyone who has a little land and will spend a modicum of sweat upon it. In point of fact, good farming is a highly skilled and occasionally a highly specialized calling. Almost any man can scratch the ground and plant seed, but the man who knows what his soil needs, how to meet that need, how and when to plant, to cultivate, to protect from enemies and to gather, preserve and market his harvest is in his way a really learned man. Industry is not enough. He must have experience, foresight and good judgment if he is to do those things so as to serve the common need, and at the same time keep his farm productive and win a modest competence from his labors. Moreover, he must do his work by means of forces that are largely beyond his control, and that may sometimes prove distinctly hostile. The man who knows the successful farmer best is the first, not only to do him honor, but to deprecate much of the advice in which he has been well nigh drowned."

This from the Youth's Companion states the case most admirably. Some of the farmers have been restive under this flood of advice, more have been too busy to pay much attention. However, let's open up to the best there is coming our way.

## WHEAT

Note the article on the third page of this issue; it refers to wheat conditions the world over. With a \$50,000,000 appropriation made by congress to be used in the purchase of wheat and in the stabilizing of prices, an opportunity is offered to the wheat grower such as seldom occurs. There is no gambling necessary on wheat for the next 18 months. Determination of a fair basic price to be paid for wheat by the government lies in the hands of a committee. It is expected by the food administration that this price, when agreed upon by the committee, will be maintained in private as well as in government transactions.

The wheat price committee, which will meet in Washington at once, consists of H. A. Garfield, president of Williams College, chairman; Charles J. Barrett, president Farmers' Union, Union City, Georgia; William N. Doak, vice president Brotherhood of Railroad Trainmen, Roanoke, Virginia; Eugene D. Funk, president National Corn Association, Bloomington, Illinois; Edward F. Ladd, president North Dakota Agricultural College, Fargo, N. D.; R. Goodwin Rhett, president Chamber of Commerce of the United States, Charleston, S. C.; J. W. Shorthill, secretary National Council of Farmers' Cooperative Associations, York, Neb.; James W. Sullivan, American Federation of Labor, Brooklyn, N. Y.; L. J. Tabor, master Ohio State Grange, Barnesville, O.; Frank W. Taussig, chairman Federal Tariff Commission, Washington, D. C.; Theo. N. Vail, president American Telephone and Telegraph Company, New York City; Henry J. Waters, president Kansas State Agricultural College, Manhattan, Kansas.

Allied wheat purchases in the United States, together with those of our own government, will be handled by the corporation. This will not only stabilize prices to the Allies, but will also protect the corporation against possible loss.

Decision of the food administration to require the Allies to purchase flour instead of wheat is of very great importance to agricultural and other interests of the United States. Through the exercise of this regulation the by-products of the wheat milling industry, which are sorely needed by livestock growers, will be kept at home.

## CROP CONDITIONS

By United States Department of Agriculture Weather Bureau

San Francisco, August 28.

Temperatures in California during the week ending August 28, 1917, averaged slightly below normal along the coast and from two to five degrees above normal in the interior of the state. No rain fell except a few showers near the end of the week in the foothills and mountains. Rain now badly needed for pastures, trees and late truck crops. Feeding the ranges is holding out well, but forage in the valleys is getting scarce and farmers have turned stock to the stubble fields whenever possible. Harvesting of small grain is practically finished and thrashing is advanced. Yields of barley and wheat continue good and in most places are better than expected. Corn making a good growth and the wheat and sorghum varieties are growing splendidly. Rice is beginning to ripen and the crop is everywhere reported as being in excellent condition. Beans are free of lice and picking has come general. Some farmers are planting their second crop of potatoes and in the southern counties corn is being planted for ensilage. Potato acreage is large, but the crop is not growing well on account of long continued dry weather. Reports on the condition of beans vary greatly. In some few places this crop is failing, while in other localities looks remarkably thrifty and promising. Complaints are made of more or less damage being done to fruit by birds, aphids, red spiders and mildew, but nowhere is the damage reported as having been serious. In some localities the pink beans are not setting well, but the lima and black-eyed varieties are maturing nicely, and harvesting of beans has become general. The tonnage of sugar beets not up to expectations, but the yield is high and the crop on the whole fairly satisfactory. Apples are maturing rapidly, and in Santa Clara County, where 51 per cent of apples in the state are raised, crop is unusually promising. In Pajaro Valley it is somewhat spotted but a full crop will be gathered. In the neighborhood of Felton and Big Bear conditions are most promising, but in Blackburn Gulch it is somewhat light. Throughout the county where care was taken the quality of apples is good, while elsewhere the quality is only fair. Codling moth damage less than usual. Apple drying will begin about September 1. The pear and peach harvest is well advanced and prune drying and the picking of raisin grapes have begun.

## REPORT OF SAN JOAQUIN CATTLE TESTING ASSOCIATION

The following are the five leading herds in milk production for the testing period of 31 days, first giving cows in herd, second average pounds milk: Gotshall & Magruder, 22, 1192; F. J. Kell, 22, 954; County Farm, 36, 914; J. Fiori, 29, 836; Gronner, 19, 788.

The following are the five leading herds in butter fat production for the last testing period of 31 days giving number of cows in herd, average pounds butter fat: Gotshall & Magruder, 22, 44.7; J. Fiori, 29, 34.5; F. J. Kell, 22, 33.1; County Farm, 36, 31.4; R. W. Fisher, 20, 31.2.

Instead of holding a fair farmers in Merced County plan an assembly taking of picnic features. It will be under the direction of the farm bureau.

# Agricultural News Notes of the Pacific Coast

## Northern California

Nevada County is shipping freely Bartlett pears.

There are 900 acres of strawberries in Sacramento County.

Hop growers have fixed on a one-cent per pound price for picking.

The Placer County farm bureau will hold its fair at Auburn September 3-6.

Sutter County's bean crop is valued at \$3,000,000. It was grown on about 8,000 acres.

Prof. Ralph Smith of the state university is investigating walnut growing conditions in Sutter County.

It is thought that California may lead all the states of the Union in the production of beans this year.

Outside capital is being interested in fruit lands of Shasta County, largely because of irrigation extension.

Native sons are planning for festival days at Sacramento the first three days of the state fair, September 8, 9, 10.

The Humboldt County Dairymen's Association is discussing labor shortage and endeavoring to secure help for its members.

California will take from her soils this year vastly more wealth than in the richest year of gold mining in the state's history.

The Arbuckle, Colusa County, almond festival committee has changed the date of its festival which will now be held September 7 to 9.

Sacramento claims that within a short distance of the state capital there are 66,890 acres in beans, which will produce a \$7,000,000 crop.

Movies have been taken of harvesting scenes in Sacramento County. One scene showed seven combined harvesters cutting a swath 175 feet wide.

Much interest is being manifested in the short courses to be conducted at the university farm school at Davis, Yolo County. The courses will begin in October.

A poisoning campaign launched against grasshoppers in the Esparto, Yolo County district, has succeeded and it is reported that the hoppers not poisoned have migrated.

Owing to burning of grain and injuring of live stock farmers of Butte County are leaguely together and planning a vigorous campaign of protection from the lawless element.

"Hops are still hopping" is the word passed in the hop fields, the price now reaching close up to 32 cents. Unfortunately many fields were contracted for at around a ten-cent price.

The rapid spreading of the disease of anthrax in the herds of the Sacramento Valley has caused the belief that there is a malicious movement on the part of organized forces to spread the infection.

The board of directors of the Anderson-Cottonwood irrigation district of Shasta County sits as an equalization board next Friday. The board of the Happy Valley irrigation district will act as equalization board on Saturday.

One grain field of about 25,000 acres in District 1000, between Vernon and Sacramento, is handled this year without sacks. The big combined poured into tank wagons, from which the grain was carried to the Sperry storage bins and handled on barges direct to the mills in bulk.

## Central California

Last week was squirrel week in Tulare County.

Raisins are being harvested and placed on the drying trays.

Tulare County dairymen received from the creameries last month \$138,250.

Tulare County has a cheese factory which turned out last month over 7000 pounds.

The Stanislaus County board of supervisors will aid the coming fair to the extent of \$2000.

Citrus people of Tulare County are planning construction of several new citrus packing houses.

Butterfat prices now being received by Kings County dairymen range from 42½ to 47 cents.

Two camps of Southern California high school boys have been installed in the vineyards near Dinuba, Tulare County.

Overripe cantaloupes shipped from Turlock, partly because of slow freight, arrived in Eastern markets in poor condition.

Jersey breeders of Stanislaus County are to hold a sale at the county fair, which will be held at Modesto September 17-22.

A large fruit packing house at Fresno was recently partially destroyed by fire which it was discovered was of incendiary origin.

The Valley Fruit Growers' Association is planning with various labor organizations for a supply of labor to handle raisins and other crops.

Horticultural Commissioners Howard of Kings County, Collins of Tulare and Roullard of Fresno are organizing a tri-county squirrel and rabbit campaign.

Lands near Terra Bella, Tulare County, are irrigated with water developed from wells. This development is progressing more rapidly than at any preceding period.

Many Merced County cattle which were thought to have died because of poisoning are now thought to have died because of eating Johnson grass in which Prussic acid was developed by the heat.

A Chowchilla bean grower has had success in poisoning rabbits which infested his bean fields, by using the arsenic, bran, molasses mixture; arsenic one pound, bran one gallon, molasses one quart, spread in rabbit runways as sun is going down.

Citrus fruit associations of Tulare County are trying experiments of economy of management. Four associations are to be brought under the management of one head. The one manager is to have entire charge of the crews in the four different houses.

The California Peach Growers' Association is experimenting to determine the amount of shrinkage of dried peaches in transit to market. Once this is determined the packages will be weighed so that guarantee of absolute net weight of every box may be made.

Laborers of the raisin drying sections have united in demanding five cents per small tray for picking Muscat grapes, one cent additional for large trays and four cents per tray for picking Thompsons and Sultanas. Where Sunday work is done a price and a half charge is demanded. The Growers' Association is insisting on a three cent price for Muscats in small trays.

## Southern California

The Chino sugar factory is running at full capacity.

The Riverside cannery is now running on tomatoes.

Orange County has produced this year about 1000 tons of dried apricots.

Apricot growers are disappointed at the low price prevailing up to this time.

Yucaipa Valley apple growers are planning for an apple show to be held this fall.

The Riverside Canning Company is packing its largest output of canned tomatoes.

The first car of apples out of the Beaumont section was sent out about the 15th.

Sugar beet fields of Chino, San Bernardino County, are suffering because of labor shortage.

Riverside County alfalfa growers are urged to make a campaign against the alfalfa caterpillar.

A 75 horse power engine is being installed in the new cotton gin at Blythe, Riverside County.

One hundred and forty tons of hay recently went up in smoke on the McEuen place near Riverside.

The Coachella Valley Date Growers' Association will make an exhibit of its dates at the Riverside fair.

There will be spent in San Diego County during the next year over \$14,000,000 in water development.

Almond harvesters in the vicinity of Paso Robles commenced this week. A 60 to 70 per cent crop is expected.

The Cooperative Cannery at Hemet, Riverside County, has sold most of this season's output at long prices.

Irrigators of the Victor Valley are conferring in the endeavor to materially increase supply of irrigation waters.

Imperial Valley is receiving at Hanlon heading 2125 cubic second feet, and danger of drouth for this season is past.

Land owners of the Cherry Valley near Beaumont, Riverside County, are discussing the matter of better irrigation supply.

In the campaign for farm labor Imperial County farmers have signed up 70,000 acres of cotton and 30,000 acres of grain sorghums.

An appraiser from the federal farm loan bank at Berkeley is investigating conditions in the Indio, Coachella Valley, section of Riverside County.

Almost daily shipments of beef cattle have been made from Lancaster the last few weeks to the beet fields around Anaheim for fattening.

Alfalfa hay shipments from Lancaster in the Antelope Valley to southern points this summer have exceeded any thing ever known in the valley before.

A \$250,000 corporation has been formed in Riverside for the purpose of establishing a dehydrating plant. It will handle potatoes, carrots, turnips, beets and other crops.

The Riverside Portland Cement company and the California Portland Cement Company are now fitted for saving from all the kilns the wastes from which potash is made. It is said that this means a saving of over \$300 per day.

## The Coast

Spokane Interstate Fair is to be held next week.

Freewater, Oregon, will ship about 150 cars of apples.

The state of Washington has adopted federal grain standards.

Southern Idaho's sugar beet crop will be above the average.

The round-up at Pendleton, Oregon, will be held September 20-22.

Klickitat sheep men are selling lambs at ten dollars per head.

Spokane's first car of '17 wheat sold at an even \$2.00 per bushel.

A horse and mule show will be held at Pendleton, Oregon, October 6.

More silos are being built in Idaho and Utah than any preceding year.

The Pacific International Live Stock Show will be held at Portland, November 19-24.

Cutworms are ruining thousands of acres of sugar beets in Fremont County, Idaho.

Deschutes County, Oregon, will have only a 40 per cent crop of wheat because of drouth.

The potato crop of Kootenai County, Idaho, will be 50 per cent of normal on account of drouth.

Lewiston, Idaho, reports the longest dry hot spell since crops have been grown in that section.

The Hood River Fruit Company is building a new packing house and warehouse at Hood River.

One fruit packing firm is building a number of new fireproof packing houses in the Yakima Valley.

It is estimated that the four Northwestern states will have an output of 23,500 cars of apples this season.

Agricultural Agent Paschall reports promise of greatly increased acreage in winter wheat in Cochise County, Arizona.

The Colorado cabbage acreage is 15 per cent larger than last year, while its celery crop will be about 20 per cent short.

Several canning clubs in Thurston County, Washington, are putting up under contract a commercial pack of fried chicken.

Stockmen of Jackson County, Oregon, are sending out much butcher stock before ready for market because of shortage of feed.

Labor troubles along the coast have driven many laboring people inland and Eastern Washington farmers report the labor situation easy.

Condensaries at Logan, Utah, paid 56 cents per pound for August butter fat. The state of Utah is shipping 24,000,000 pounds of condensed milk each month. This is an increase of over 1000 per cent since the beginning of the war.

Southern Idaho will produce this year 2200 cars of apples. The biggest apple producing center of the Northwest is the Yakima Valley of Washington. Its estimated output this season is 8500 cars. The Wenatchee district is a close second with 8000 cars.

Arizona is taking up an educational campaign against poisonous plants of the ranges which have caused the death of thousands of head of valuable live stock. A series of meetings will be followed by persistent campaign against water hemlock, lupines, milkweeds and larkspur.

## Drying Tomatoes, Green Peas and Corn

By W. V. Cruess

**T**OMATOES, peas, and corn may be successfully sun-dried on trays. They may be kept indefinitely in the dry state and when properly cooked they are wholesome, nutritious, and can be made into very palatable dishes.

### Peas

Select peas at the optimum stage for cooking fresh. If too ripe they will taste like ordinary split peas when dried, and if unripe they will dry too much. Shell and spread on trays. If wooden trays are not available paper, canvas or cloth may be used. Expose to the sun until dry. Unless thoroughly dry they will mold

when stored. Store the dried peas in such a way that insects can not reach them. It is a good plan to place them in a flour sack or similar bag and wrap the bag in heavy paper so that insects can not lay their eggs through the cloth. The dried peas may also be stored in ordinary glass jars. At the proper stage of ripeness it requires about 10 pounds of unshelled or 3½ pounds of shelled peas to make a pound of dry peas.

### Corn

The corn used for drying should not be too ripe. It should be tender and sweet. Remove the husks, place the corn on the cob in a wire basket or sheet of cheesecloth and immerse

in boiling water for about three to five minutes. Chill immediately in cold water and cut the corn from the cob. Spread on trays in the sun and allow to dry. The dried corn should be packed in bags or jars as recommended for peas.

### Tomatoes

Bright sunlight and dry weather are essential for sun-drying tomatoes. Cut the tomatoes in two at right angle to the stem. Large fruit may be cut into thick slices, spread on trays and allowed to dry in the sun. It may be necessary to turn the tomatoes several times to prevent molding. Dry them until they are tough and leathery in texture. They are then packed tight in barrels or boxes. A little salt should be sprinkled between the layers.

### Storage

The dried product should be pro-

tected from moisture and insect when stored. If placed in shallow pans and heated for five to ten minutes in a moderately hot oven before packing, all insect eggs will be destroyed. The same treatment will save the product if used when the attacks of molds or insects commence.

### Cooking

Corn should be soaked two to four hours, using two cups of water to one cup of corn. Peas should be soaked about twenty-four hours before cooking. A pinch of baking soda added to the water tends to soften the vegetables. Dried tomatoes will require at least twenty-four hours soaking or longer to soften and remove the excess of salt. After soaking, the vegetables are seasoned and cooked in the ordinary way. The drying process results in some loss of flavor and the dried products therefore require more seasoning than fresh vegetables.

### This 15 H. P. G-E Motor

pumps water for the irrigation of 40 acres of Alfalfa on a large western ranch.

Why not investigate the possibilities of "electric" irrigation for your land?

Once installed you merely throw the motor switch—a few cents' worth of electricity per hour will do the rest.

Just call up your lighting company or one of the General Electric Company's offices and ask a representative to look over your proposition.

Don't wait until your crop is lost for need of irrigation. Get all the information NOW.

## Vegetable Planting Calendar for September

### Northern California

Written for California Cultivator By A. R. Gould

**W**E must devote most of our attention during this month to a general "clean up" and in our spare moments plan for the coming season

when it is hoped that we shall all increase the vegetable supply and plant still more than we did this past season. The food supply will be short no doubt as there will be large exportations to allied countries. In anticipation of early rains it will be necessary to clean up those plots in the garden which we intend to devote to early peas, onions, broad Windsor, or horse beans, and turnips.

Ample space should be reserved for these crops and the plots well prepared by being deeply dug and manured. Any weeds or refuse should be dug in without delay and the surface left clean and level, ready for the early plantings. Make a note of the last crop grown on the various plots so that good judgment may be used in following up with rotational crops, for instance a root crop such as beets or carrots should not be planted again on the same plot but should be followed by legumes such as peas or beans when possible, and wherever there is any sign or even suspicion of the crop being diseased it should not be grown again in the same place for several years as, whether insect or fungous disease, the spores of the latter and eggs or pupae of the former are lurking in the soil to attack again. Fungous diseases generally confine their attacks to the one crop. Certain rust diseases have certain genera marked out for preference and keep to those genera, hence by a careful study of these conditions we are able to starve them out, as it were, by changing the crop.

### Potatoes

If late varieties are matured they should be stored in the cellar. We have recently seen appeals in the press to the patriotic to plant potatoes at once to secure crops for the

coming winter. To those readers living in our northern section of the state we would advise caution as severe frosts may injure this crop late in the season.

### Tomatoes

See that the larger bunches of fruit are well supported on plants being grown on the single stem system as they are liable to break with the weight before ripening. Keep a close watch for any diseased fruits and promptly remove. There should be a good quantity of ripe fruits ready for present use and canning.

### Leeks

It will be necessary to feed these with liquid farm yard manure, and an occasional application of soot water will also prove of value. At this stage also they must be blanched and the method advised last month for celery should be adopted for the stems, or even thick cardboard is excellent for the purpose.

### Parsley

Make a sowing of the variety "Finest Curled." It will then become well established before the severe weather.

### Swiss Chard or Sea Kale Beet

A sowing of large ribbed white should be made for winter use. This is also used as a salad, but is very valuable to keep cutting from as a green vegetable.

### Collecting Beans Dry

Those beans which were left over too long to use in the green state may be now collected for seed and for use in the dry state. The tepary bean will now be ready in most sections and every seed should be collected. The soya bean will not be ready for a few weeks. If you have a considerable quantity of dry beans to collect, pull up the whole plant as it becomes yellow and place on a large sheet on the ground when the beans will soon fall out.

### Southern California

Written for California Cultivator By D. F. Reichard

**I**RRIGATION must still be depended on for moisture for plantings during this month; the same methods should be used as suggested for Aug-

ust. Although practically everything that was recommended for planting last month may be planted during September it is well to take one's local climatic and soil conditions into

**P I P E**

For Every Purpose NEW Threads and Couplings Hot Asphaltum Dipped

2nd Hand and NEW

Screw Casing Fittings and Valves Guaranteed for Pressure

**Pacific Pipe Co.** Main and Howard Sts. San Francisco

consideration. For as the days shorten and the average temperatures lower the scope for planting the more tender vegetables lessens. However, for planting the hardier varieties such as beets, carrots, parsnips, turnips and the cabbage family September is really better than August. Peas may be planted at this time but require ample water which must be supplied by irrigation until the rains set in. These will be ready for holiday use.

Now the pea seed—any variety will do well now, but Yorkshire Hero and Senator or Admiral are the leading ones for Southern California—in freshly opened damp furrows and cover one to two inches with moist soil, then harrow lengthwise of the rows to push loose dry dirt into the furrow to nearly fill it. This will bury the seed three to four inches. When the young peas are up so as to show the rows, furrow out between the rows and irrigate and cultivate about every ten days according to the nature of the soil.

Heavy plantings of cabbage and

cauliflower will be made this month in beds or thick in rows for transplanting into the field during November. Have the seed beds rich and handy to wet so that the young plants will not be checked at any time of their growth.

Plant early varieties of onions in seed beds to be transplanted later to the field or they may be planted directly in the field. Use Early White Queen or some variety of the Bernuda onion. These will mature in April or if something a little earlier is wanted use the onion sets of the same varieties if obtainable.

Potatoes may be planted in foothills and places where frosts do not come until late, but as a general thing they can not be recommended after the last of August. The same may be said of corn and bush string beans. In strictly frostless locations egg plant, peppers and tomato plants may be set out for very early crop.

It is too late to plant summer or winter squashes, pumpkins, melons, cucumbers or any of the tender varieties except in thoroughly frostless districts.

## Ornamental Planting Calendar for September

### Northern California

Written for California Cultivator By A. R. Gould

**D**URING this month we have to make plans for the coming spring and any alterations in garden arrangement should be carefully studied in every detail. It may be that we must put in a new lawn or extend our borders or change some portion of our existing perennial plants. Now is the time to make a survey. If it is intended to put in a new lawn the present one should be well spaded under, and if many deep rooted weeds such as dandelions, etc., are present the turf should be put under at least a foot and a half. The surface should be well dressed with bone meal and well watered to allow any weed seeds to germinate, which they will do in a few weeks. These can all be destroyed before the grass seed is sown. Never be in too much of a hurry to get the new lawn in, as you will have less weeding to do later on if careful attention is given to these details. Have the surface well graded and in good shape and have a fairly firm surface to plant in. We shall deal with grass seeds and lawn mixtures more fully next month.

### Southern California

Written for California Cultivator

**A**BUSY time in the ornamental garden is here. It is a time of dearth of flowers, to an extent at least, hence there is lack of inspiration in looking ahead until the spring months. But some of the earlier blooming spring bulbs should be planted this month, for example, Watsonias, while the earlier daffodils should at least be thought of sufficiently to get the ground ready. No more satisfactory returns are given for labor than by the various members of the narcissus family. And then one may begin this month planting hyacinths, tulips, anemones and many other of the Dutch bulbs.

Iris may be divided from the middle to the last of the month and the ground enriched. The "poor man's orchid" is worthy of more general attention. Later in the month ranun-

culi and anemones will be in order. These plants are a bit hard to get results from, but planting in rich, loamy soil two or three inches deep, with plenty of water, should give good returns. Both of these bulbous plants should receive liberal soaking before planting.

It is the ideal month for planting pansy seedlings, columbines, calendula, candytuft and forget-me-nots. The first planting of sweet peas may be made this month and ground made ready for another planting in early October.

Then there are a number of annuals: Canterbury bells, centaurea, gailardia, coreopsis, foxglove, sweet Williams and a number of others, inexpensive, yet giving a gorgeous showing of color, which may be given the first planting this month.

The lawn needs some attention, and

A tree in a blasted bed (at left) roots deeper, grows faster and bears earlier than a tree set in an ordinary dug hole (at right).

"The soil is the pasture in which the roots of the tree feed," says the Wyoming Experiment Station. "Blasting enlarges the root pasture, breaks up the hardpan and subsoil and permits the roots to go down and get plenty of food."

Plant your fruit trees in beds blasted with

## GIANT FARM POWDERS

STUMPING — AGRICULTURAL

—Eureka Stumping or Giant Stumping—which are made especially to meet Pacific Coast farm and orchard conditions. They pulverize the subsoil better than ordinary dynamites which often act too quickly and pack the earth.

Because the superiority of Giant Farm Powders is so generally acknowledged, other explosives are frequently offered as "giant powder." Insist upon having the genuine—always bearing the Giant brand.

### Book "Better Orchard Tillage" Free

It tells and shows how to give your trees more pasture; how to blast for planting and how to increase the crops of bearing trees. Other books—on Stump Blasting, Boulder Blasting, Ditch Blasting and Subsoil Blasting for farm crops—are also sent free. Mark in the coupon the books that you prefer.

## That You Will Like

Have been consigned by leading breeders of Stanislaus County, California, to a sale to be held at

**Modesto, California**

**TUESDAY, SEPTEMBER 25, 1917**

Seventy-five HEAD will be sold at your own price. These will include the entire herd of Jno. A. Orr, Ceres, except a few head not in sale condition; all the great Register of Merit cows in the herd of W. J. Hackett, Ceres; six choice females that were permitted to pick from the herd of O. J. Ames, Oakdale; twelve head from Riverina Farms, Modesto; and some choice females from the herds of Fred B. Wulff and M. W. Brady, Modesto.

If you want foundation stock of the right sort, you will find it in this sale, and an important point is that a very large percentage of the females to be sold are fresh or heavy spring cows and heifers.

Every animal over six months has been tuberculin tested and certificate will be furnished, and further than that you have the privilege of tuberculin testing any animal you buy yourself, and if it reacts you don't take it.

When writing advertisers, mention The Cultivator.

If Bermuda is becoming pretty well established a thorough raking and the application of commercial fertilizers will encourage the bluegrass and give a surface which will not turn entirely brown when the frosts come. Bermuda makes a fair lawn in summer and will stand an enormous amount of wear, but it is coarse and has an unfortunate habit of turning brown as soon as the frost strikes it. It is comparatively easy to keep enough bluegrass mixed with it to maintain the green through the winter.

Prune heavily Cherokee and other spring blooming roses. Other roses which have been dried off this season, if pruned heavily late this month, will give liberal showing of holiday blooms. Prune back vigorously geraniums, heliotrope and other small plants. They will then give heavy fall bloom.

In any case, where there is a vacant space dig and fertilize and fit the ground for later use.

Chrysanthemums should be pushed from now to the blooming season, given an abundance of water and fertilizer. Fertilizer should be dis-

continued when color begins to show in the buds; otherwise they will turn black and fall. As to disbudding we give directions from Ernest Braunt's "Garden Beautiful" published by the Cultivator: "All buds below the top ones should be rubbed out as soon as they appear. This is easily accomplished as soon as the lower buds show by 'rubbing them' out with the finger tips, as they are very brittle. On some sorts a goodly crop of attenuated side branches break out well down on the main stem, and these should be kept off, or they will take part of the food and thereby weaken the main crop."

"Much care must be taken in top or flower disbudding as the stems are brittle. Hold the buds with one hand and take a small stick like a toothpick and crowd off the buds you wish to dispose of. If you should leave a leaf bud instead of a flower bud all is not lost. The leaf bud will make a branch which in a short time will present a terminal cluster like the one with which you have just dealt; then try again. This breaking out of buds must not be neglected for even a few days."

## Who's Who

With the issue of August 11 the Cultivator started its series of "Who's Who" articles to bring before its readers some of the livestock producers of California who are responsible for the large development of the industry. Where did they come from and how long have they been engaged in California development, also how do they look, so pencil and camera are to be used, and some homely, everyday photographs and notes regarding them will bring us closer together. Bear in mind we say "homely photographs" and not photographs of homely people. The idea we wish to convey is that so far as possible we will secure photographs in everyday surroundings at the homes of the livestock producers.

Other sketches and portraits will appear in the next and following weeks.

Written for California Cultivator By F. F. Stonerod

INTIMATELY known to the rank and file of California beef cattle breeders are the name and achievements of C. N. Hawkins, of Hollister, San Benito County.

Mr. Hawkins is the proprietor of the Pacheco Cattle Company, president of the Grangers Union of Hollister, is interested in several banks, and is one of our foremost breeders of Shorthorn cattle.

His father was one of the pioneers who settled in San Benito County in 1869. After a thorough commercial and academic training in the schools the son graduated from college fully equipped to carry the weight of large affairs in after years.

He became interested in the mercantile business, and the Grangers Union Company of Hollister as it stands today is an example of his commercial ability. Completely destroyed in the earthquake in 1906, and again three years ago by fire, the first disaster a total loss, the old buildings have been replaced by a modern fireproof structure covering nearly a quarter block, in which a vast trade with the countryside is carried on.

But it is in the field of live stock that Mr. Hawkins has made notable accomplishment in a comparatively short space of time. On his 20 odd thousand acre ranch a short distance from Hollister he has grazed thousands of high grade beef cattle for nearly a generation. Always he has used the best pure bred bulls he could buy. A few years ago he established a breeding herd for the purpose of producing not only his own bulls for range duty but to supply the growing demand for bulls in the Coast market. By intelligent selection he has founded a herd of Shorthorn cattle which would be difficult to duplicate. Like all our most successful American breeders Mr. Hawkins bred his animals with a fixed purpose in view. He is an advocate of the utility type

of beef cattle, individuals that will make good under our peculiarly trying coast conditions. That he has made good is testified to by the range cattle men to whom he has sold bulls.

Mr. Hawkins believes in the stock show and fair as an educational institution. He showed less than a half dozen head at the San Francisco world's fair because his herd was not of large proportions at that time, but he won high honors nevertheless. This

C. N. Hawkins

year however he will exhibit a large string at Sacramento and planned to show at both Los Angeles and San Francisco had there been shows in those cities.

With the exception of one cow every one of the hundred breeding females and the herd bulls on the ranch are of his own breeding. This fact is indeed noteworthy and it is one thing which makes the Pacheco herd a credit both to the state and to the owner.

Asked what his hobby was Mr. Hawkins replied, "Shorthorns." He spends most of each week at his desk in the city, but as he expressed it,

"My heart is out there on the hills with my Shorthorns."

Mr. Hawkins is a comparatively young man, has a fine family, maintains a beautiful home in San Fran-

cisco as well as in Hollister, and is training one of his three sons, T. B. Hawkins, to handle the ranch business, and "Tom" is making good because his name is Hawkins and because he is his father's son.

## Breed Leaders

Every breed of live stock has its outstanding character the same as the human kind. A great dairy cow has proved her ability to produce anywhere up to 15 tons of milk annually; the trotting horse has secured his record around two minutes; the beefmaker has shown his ability to make the least amount of feed into the greatest amount of food; swine, sheep and others of the live stock family have shown themselves great characters. In addition—and here is where their worth is proven—these animals can transmit their productive power to their offspring.

Beginning with the issue of August 4 the Cultivator gave an account of Pietertje Bloom of the university farm dairy herd. Some things she has done and more that her daughters have done were chronicled. She was a most worthy leader in this series of articles. Others of her kind follow. More of the "handsome is as handsome does" type of animals will be given in the columns of the Cultivator during the next few months.

Written for California Cultivator by C. A. Briggs

**A**T the Sacramento State Fair in 1916 a fine junior two year old took the second prize. This was the bull belonging to J. W. Benoit of Modesto. The picture below shows him as he was at that time, good to look at.

Better than that his calves are com-

A. R. O. daughters, 25 daughters with 41 A. R. O. daughters. His grand sire, Colantha Johanna Lad, has 96 A. R. O. daughters, six above 30 pounds, 70 sons with 435 A. R. O. daughters, 35 daughters with 42 A. R. O. daughters. His sire, Colantha Sir Pontiac Aaggie, has eight A. R. O. daughters. His sire's dam, Aaggie Cornucopia Pauline

El Prado Wayne Colantha

ing along stamped with all of the sire's individuality.

He was born December 27, 1913, sired by Colantha Sir Pontiac Aaggie sired by Colantha Johanna Lad sired by Sarcastic Lad. His dam is Edith Mandel Wayne, a 30.09 pound cow with a 4.97 test. Her 30 day record is 111.95 pounds of butter, 2407.10 milk. Averages of his dam and sire's dam (at 4 years) show milk 415.50, butter 26.02, per cent of fat 5.01. His great grandsire, Sarcastic Lad, has 34 A. R. O. daughters, 36 sons with 514

3rd, made 21.96 pounds butter at four years, 346.30 pounds milk with a 5.07 test. His sire's dam's sire, Dutchland Sir Pontiac Rag Apple, has 24 A. R. O. daughters, 11 sons with 67 A. R. O. daughters, eight daughters with eight A. R. O. daughters. His sire's dam's dam, Aaggie Cornucopia Pauline, made 34.32 pounds butter in seven days and 137.62 pounds in 30 days at 4½ years. She has five A. R. O. daughters, three sons with 181 A. R. O. daughters, two daughters with seven A. R. O. daughters. "Johnny" Benoit may well be proud of El Prado Wayne Colantha.

## California Guernseys at National Dairy Show

Edgemoor Guernsey herd will exhibit at the National Dairy Show, Columbus, Ohio, in October. As far as we know this is the first time a California herd has been entered in this classic. That the Edgemoor entry will give a good account of itself is a foregone conclusion. If the Eastern breeders have anything in the aged bull or cow classes that can beat Imp. Itchen Wood Sorrel, or Imp. Itchen May King, we would like to see the animals. Coast fair goers are familiar with the snow yard performances of this great pair so they need no repetition here. But the calf herd, get of sire, etc., which Mr. Dupee will enter will be just as hard to beat as the aged stuff. We have never seen a better senior heifer calf than Wood Violet of Edgemoor, a daughter of Imp. Wood Sorrel. She is about as near perfect as they are made. As her sire is Imp Itchen May King too she is the daughter of two grand champions, so if she wins in her class it will not be an accident. Space does not permit going into detail about this show herd. It will have the keenest competition possible, for all reports have it that the 1917 show will surpass its predecessors both in the quantity and quality of its entries. The Dupee herd will be in charge of E. W. Major, and Happy Allen will lead them into the ring.

The original intention was to show

the herd at Sacramento before going East, but not only Itchen Wood Sorrel but several other show cows will not freshen in time for this show. The young herd would have been taken to Sacramento however had circumstances permitted. So in all probability the Dupee entry at the state fair will be scratched for the first time. There are some 20 cows on test at Edgemoor at the present time, and there is one heifer in the lot which will break the world's milk record for Guernsey cows in class C, (junior three year old). She is Donnington Goldie 5th, and at this writing she has made 16,034 pounds milk and 708 pounds butter fat, with six-weeks to go before her year is up.

# Public Auction

**100 Head Holsteins and Durhams 100 Head**

On the Dick Ranch on the Oakdale Road, 6½ miles Northeast of Modesto and 1½ miles Southwest of Riverbank on

**Tuesday, September 13**

we will sell the following live stock to the highest bidder for cash:

- 45 Cows
- 29 heifers
- 25 young calves
- 1 Holstein bull 2 years old
- 4 brood sows
- 23 shoats
- 24 small pigs
- 2 colts
- 1 top buggy
- 2 mowers
- 1 rack
- 35 head of fresh cows
- 9 head of springing heifers

Can give test and weight of milk of each cow.

Dairymen, this a fine bunch of cattle and excellent producers. Don't fail to attend this sale, come early as the sale will begin promptly at 11 o'clock. No by-bidding, no boosting, no fake bidding, everything absolutely sells, lease has expired on ranch is the reason for selling. Free lunch. Don't forget the date, Thursday, September 13th.

## Special Offering in GUERNSEY BULLS

No. 1. Monograms Prize, No. 43094. One year Sept., 1917. Grandson of the Famous bull, Sequels Monogram. His dam full sister to cow with six hundred pound fat record. An exceptional individual. Price \$150.

No. 2. A Monogram, No. 43989, 11 months old. 75 per cent blood of Katonahs Monogram, a son of Sequels Monogram and the famous transmitting cow, Nancy Mac. Good individual and fine color. Price \$125.

Address

Frank Reed Sanders, Mesa, Ariz.

## HOLSTEIN-FRIESIAN CATTLE

Registered young bulls from best families. Some of serviceable age.

### REGISTERED BERKSHIRE PIGS

Masterpiece, Longfellow and Robin Hood Strains. Fine individuals of both sexes—we pay registration fee. Careful attention given to mail orders.

### Whittier State School

Whittier, Calif.

## Field Notes from the Live Stock Men

Wm. Bernstein, Kings County breeder of big type Poland-Chinas, will take a wonderful lot of sows to Sacramento this year. Mr. Bernstein did not show last year, being unable to get his stock ready in time, but he will make up for lost time on this year's circuit.

Arlington Smith, Tulare County Berkshire breeder, will not be seen on the 1917 fair circuit with either his Berkshires or Ayrshires. He entered his stock but found it was absolutely impossible to leave his ranch just at the time when he is most needed. The Berkshire men will regret his absence as he not only has a splendid show herd but is very popular.

Tagus Ranch, Tulare County, is another that will not show animals of its breeding at the fairs. Labor conditions have worked havoc at Tagus as elsewhere. Mr. Merritt intended to show Holsteins, Percheron horses, and Duroc-Jersey hogs. While it was not the intention to show California Defender again, several of this great boar's get are prospective blue ribbon winners, and the Tagus sows are indeed a classy lot.

Allen Thompson, Tulare County Duroc breeder, expects to be at Sacramento with a full herd. Orions Golden Colonel heads the Thompson herd. He is the boar which won first money at Fresno last year. The futurity entries are an even bunch of youngsters of the usual Thompson quality.

R. H. Brittingham, Tulare County, is getting into the purebred Jersey business as fast as he can dispense with the few grades he has left. He bought several good ones at the McFarland sale last spring and in time will do official testing.

A. A. Jenkins, the young Tulare Jersey breeder who won so many prizes his first time out on the circuit last year, will be back again this year if nothing interferes at the last moment. In Gerties Golden Victor Mr. Jenkins has one of the coming show bulls of the country. He is bred in the purple too, having a 536 pound dam and a sire who at four years of age has given Mr. Jenkins a promising lot of heifers. This youngster has all the earmarks of a coming champion. He has a velvety hide, a perfect top line, large and well placed rudimentaries, and to complete his qualifications he has that stylish carriage in the ring which counts for a great deal. Mr. Jenkins has set a high standard of production for his herd and is working along the right lines. He is one of California's real Jersey enthusiasts.

J. K. Macomber's Poland-China boar, Chief Picture 2nd, is still on the job and looks better at four and a half years of age than as a yearling. Mark Bassett, who bred this boar and sold him to Mr. Macomber, admits he made a great mistake for he is the sire and grandsire of many of the Bassett champions. As a pig he was a trifle under size and at the time he was sold he was not in the best of shape, but he afterward developed into a remarkable sire. Whether it is his splendid breeding and individuality or the fact that he has never been fitted for the show ring which is responsible for the quality of his offspring is a matter for argument. Seeing is believing, and Chief Picture Poland-Chinas are usually headliners.

Peters, Lamson and Walker, are now located permanently at Devore. After moving their herd of Duroc-

Jersey hogs from Holtville to Fontana and assuming charge of the big Fontana herd of market and breeding stock, they decided to assemble their privately owned stock on their mountain ranch. Not since this partnership of breeders first established their business in this state a few years ago have they had such a high class lot of stuff. Golden Model and Ohio Chief breeding predominates. They are breeding for the "big type" kind, and are getting it. Moreover, they are Ames, Iowa, agricultural college graduates and know how to breed and feed. Mr. Walker and Mr. Lamson are both in the draft, and until they know whether or not they are accepted for military duty nothing will be done with the show herd. We predict that when this herd does get into the showyards this year, next year, or thereafter that it will take some mighty good stock to beat it.

G. W. Wilder's Hollow Hill Guernseys are coming along in fine shape despite the hot weather, labor troubles, etc. Cherry 3rd of the Effords, 43381, has made 509 pounds of butter fat from 12,017 pounds milk in 256 days in Class B. She led all the cows in the state competition in November with 1576 pounds milk and 77 pounds fat. Coras Beatrice, 24808, has been on test 110 days and has made 253 pounds of fat. This cow is a half sister of Caroline of Chilmark, 24842, who just finished her year's test with a record of 723 pounds butter fat. Imp. Brittleware Mistletoe, 48510, in class B has made 530 pounds fat in 243 days and 14,649 pounds milk. This is one of the most promising Guernsey cows in the country, for if she maintains this gait she will be among the five leading cows of the breed in her class. All three of these young cows will be continued right through the year on official test in addition several others when they freshen.

W. H. Rough, Riverside County Poland-China breeder, the man who owns Superba, world's fair champion boar, is practically sold out of surplus stock and will make no effort to either show or buy new stock until his crops are harvested. Mr. Rough is fitting up his new farm with modern improvements and has added a herd of Jerseys to keep company with the Poland-Chinas.

Alex Whaley, Tulare, is getting some remarkably fine calves from his young sire, Segis Pontiac De Kol Burke Luit. He will probably take a young herd to either Fresno or Bakersfield. Like the majority of the Holstein breeders Mr. Whaley has not been doing any testing during the abnormally hot weather. He has some sure 30 pound prospects however and will have something to report later.

Llano Vista Hampshire herd of hogs will probably not be seen at Sacramento this year. After selecting and fitting one of the best herds they ever showed the Llano Vista people are compelled to forego the 1917 shows because their herdsman quit the job last week and left Mr. Langdon just at a time when he needed him most. This herd of Hampshires seems to be getting better all the time. World's fair goers will recall the sensational winnings of these hogs. One of the outstanding winners was Sioux Queen, grand champion sow. She is champion in deed as well as in name too. Never had less than 13 pigs and never raised less than eight to the litter. If that is

not a record to be proud of we would like to know why. Another great sow in this herd is Lady Favorite, 41692. She has had two large litters in 11 months, one of 13 and the other of 11. She is exceptionally deep, fine spring of rib and strong back with a fashionable belt. Prince, a March 1916 pig sired by the grand champion boar General Tipton Again, and Harvester Again, a son of The Harvester, are two of the best looking Hampshire boars we have seen anywhere.

W. J. Higdon, Tulare, is concentrating on Holsteins now that he has disposed of his fine herd of Guernseys. Together they were a little too much for W. J. although he always got results. His only difficulty was in trying to convince the Holstein men he was not a Guernsey breeder and vice versa. With Prince Riverside Walker as his herd sire, a wonderful bunch of young cows that are sure to make high records, (one of them made better than 30 pounds butter in seven days just a few months ago), and an experienced herdsman taking charge of the test cows shortly, Mr. Higdon will be heard from. He plans to take a few good ones up to Fresno again this year.

If the labor problem gets much worse on our California stock farms, particularly the dairies, the government may be called upon to save the industry. Many dairymen are offering as much as \$75.00 per month and board for ordinary milkers and cannot get them at that price. Every line of agricultural work is feeling the pinch of labor conditions. Add to this the drafting into the army of many of our young breeders, the exorbitant price

## GET YOUR DE LAVAL NOW

It will pay for itself by spring, and there was never greater reason to save every ounce of butterfat and half-hour of time and labor.

Moreover, if labor and material costs continue to increase, your De Laval must cost you more later on. Buy it now and it will save its own cost in a few months, at present cream and butter prices.

See the nearest De Laval agent right away and let him show you what the De Laval will save for you. If you do not know the De Laval agent, write direct for any desired information.

of foodstuffs, the condemnation of hundreds of milk cows under the state law, and the answer to 50 cent butter fat is plain.

Frank Guerin, proprietor of Sunny-side Farm, is congratulating himself that he has a large family of boys to help out during these trying times. With a big string of heavy producing Holsteins to look after twice a day, silage to cut, etc., etc., Frank needs twice the number of men he has and cannot get them. He has not had a chance to put a single cow on test for months but will have a few ready shortly. This year's crop of silage corn is a wonder. It will go more than 20 tons to the acre and will be rich in grain. Nordica Queen, the Guerin cow which holds the county record for milk production both for one day and seven days, will be tested again when she freshens. It is not likely that the Guerin herd will be seen at the fall fairs for reasons given above.

A visit to "Maurice" Rucker is al-

the same question from the Standard Record, determines:

"These results show that the big type Poland-Chinas are more prolific than the medium type. It would appear that there is a correlation between size of hog, length of body and prolificacy. One probable reason for the lack of prolificacy in the medium type is that they are not so growthy as the big type, fatten more readily, and are probably more often over-fat when bred."

The breeding of more horses is to be encouraged by the army service through its refusal to buy mares for the army. Horse breeders, however, take exception to this position, maintaining that many mares not fitted for breeding still give excellent army service. The British are now paying from \$200 to \$250 for heavy stock and \$175 for artillery stock.

The Shorthorn Association will distribute about \$50,000 in cash premiums at various fairs this season.

Sheep breeders are urging that a

B. A. Wonder was primarily to cross him on Model Major sows, thereby combining championship breeding on both sides. This boar will weigh close to 1000 pounds at Sacramento and is in fine condition. Fairgoers last year will remember the sensational Model Major, "the boar with the great back" on the circuit. He has been Mr. Marsh's money sack ever since he brought him out from the East to head his herd. His pigs are of uniform excellence, carrying the enormous bone, arched back and carriage of their sire.

Add to these animals above mentioned the bunch of stuff Mr. Marsh bought from A. M. Henry recently, including Smooth Orphan, and it will be seen that this Stanislaus County breeder has laid the foundation for a herd second to none in the country.

He will occupy 12 pens at the state fair this year as he is fitting a large number of animals, and while competition will be exceptionally keen in the ring he has every reason to believe that his entries will share honors with the best Poland-Chinas at the show.

K. K. S. V. Topsy, a Holstein who as a senior three-year-old produced in seven-day full official test 40.38 pounds of butter from 568.7 pounds of milk, the butter fat test being 5.68.

Her sire is King Korndyke Sadie Vale and she is out of King Segis De Kol Korndyke Topsy. The dam's record was 33.10 pounds butter in seven days as a senior four-year-old. A proof of the power of the breeder.

ways a treat to red hog men. His Duroc-Jerseys are always worth looking at. His Trailblazer, by Pathfinder, has half brothers that have sold as high as \$1000. This stock is going strong in the East. Trailblazer is long, high, has straight legs and big bone. Kings Col de Luxe, by Kings Col, another good one, is the pick of a litter farrowed on Sept. 16. He weighs nearly 500 pounds. Among the good ones at the Rucker place is a Taxpayers 13 sow sired by the P. P. I. E. grand champion boar.

The National Dairy Show will be held at Columbus, Ohio, October 18-27.

The forest service of the United States department of agriculture is conducting an experiment on 200,000 acres of New Mexico grazing land in which various feeding tests with young beef cattle are being made. There are over 5000 high grade Herefords used in the experimental work.

Alabama is devoting less attention to cotton and more to dairying. Jerseys are the favorites. One reason given for the present advancement of dairying is that the campaign against Texas fever tick has been so successful.

In tests made at the Kansas experiment station in which 1000 litters of big type and 1100 litters of medium type Poland-Chinas were used it was shown that there was no great difference in prolificacy of the two types. The Iowa state college, investigating

federal tax be placed on all dogs as one means of increasing war revenue.

The Great Lakes Wool Conference will be held at the Chicago stock yards, September 11 and 12.

New England milk consumers have had prices advanced until they are generally paying around 12 cents per quart. Producers are receiving \$3.25 per hundred. Producers near Cleveland, Ohio, are receiving around \$3.00 per hundred.

The Indiana State Dairy Association is organizing a campaign to free the state from tuberculosis. It contemplates the campaign will require many years.

The American Dairy Science Association has just launched the Journal of Dairy Science as the official organ of the association. It is to give place for technical papers on dairying subjects.

#### MARSH PURCHASES I. B. A. WONDER

Written for California Cultivator  
By F. F. Stonerod

WITH the acquisition of Young's I. B. A. Wonder, Miss Giantess, Miss Big Knox, Knox Alice, three boars and a sow sired by I. B. A. Wonder, Hale Marsh now has one of the largest and finest herds of big type Poland-China hogs in California. The motive which prompted Mr. Marsh to pay a long price for I.

### Itch in Horses

My horses have what seems to be the itch and I would like to know what will cure it. It is mostly around their necks and shoulders. At first little pimples appear that look like fly bites and later they turn to scabs that itch terribly. — Subscriber, Porterville.

It is due to a small mite that burrows in the skin. Use zenoleum, one pint to five gallons of warm water and with a sponge apply the solution until the skin is saturated with it. Repeat this once a week until three or four applications have been made. To make sure of reaching them all the horse should be wet all over with the solution and have a thorough grooming once a day in the meantime.

### Indigestion in Sheep

Please advise me what is wrong with my sheep and what the remedy is for the trouble. He eats his food and then vomits it up. — Subscriber, Copperopolis.

It is quite uncommon for a sheep to vomit but they do in some forms of indigestion. It is caused by the food fermenting in the stomach. Take one dram of aloin, one dram of powdered nux vomica, two ounces of turpentine and one quart of raw linseed oil. Mix it well and divide into five doses. Give one dose once a day but if it physics the sheep very much skip two or three days before giving the next dose.

### Pigs Paralyzed

My three months old pigs seem to be paralyzed in their hind legs. They are on alfalfa pasture and have all the sour milk they can eat twice a day. They are fat and eat well but can walk only a few steps and then their hind legs drop. Can you tell what is wrong and how it can be cured? — Subscriber, Chowchilla.

This trouble affects a few hogs all over the country but the cause is not well understood. The United States board of agriculture recommends firing them by puncturing the skin over the loins in several places with a red hot iron. Prepare several pieces of wire about the size of hay wire and a foot or more long so you can handle them easily with a holder or pinchers. Heat them until they are red hot on one end, then using one at a time puncture the skin in six or eight places on each side of the spine over the hips and loins. Do not hesitate to push the hot iron half an inch or more into the fat under the skin. Put the iron back into the fire when taking a fresh one for each puncture. These places will heal quickly and usually cure the trouble. It would be well to add some rolled barley to the sour milk and stir the milk often while souring to get as much of the air out of it as you can.

### Mare not Breeding

Will you kindly inform me what I must give a mare to get her in heat? — Subscriber, Victorville.

The old fashioned way—and it was not a bad way either—was to bleed them, taking about three gallons of blood from the jugular vein. Usually in two or three weeks they would come in heat all right and by being bred would get with foal. Mares show their disposition to breed less than most other animals and remain in heat only about 24 hours. They should be taken to the stallion every few days until they show by their actions that they are in season. The owners of stallions usually know the signs and can advise you what to do. Breed only to a horse from which the owner will guarantee a foal or ask no pay for the services.

The annual meeting of the California Avocado Association will be held at Riverside, October 26-27.

### TRACTOR DEMONSTRATION

The tractor demonstration which was held at Fremont from August 4 to August 10 was a triumphant victory for the tractor and tractor-drawn implements. Thousands of ranchers and growers west of the Rockies were deeply interested but were unable to attend this meeting. Now there is to be a similar exhibit and demonstration much nearer home, September 18-22, at the Vail property on Telegraph Road, Los Angeles. The demonstration is to be held under the auspices of the Traction Engine and Implement Dealers' Association of Southern California. The railroads are offering summer rates of a fare and one-third for the round trip from all points in California, Nevada and Arizona.

Old farming methods are doomed. The war with its demands for increased food and grain production has given great opportunity. The whole system of farming must be speeded up. The tractor is each year becoming more nearly standardized, and time is rapidly eliminating the "freak" type, just as it did in the automobile. At this demonstration only tractors whose merits and abilities have been proven by actual service will be shown.

For those who may be in doubt as to just what a tractor demonstration is: A tractor demonstration is an occasion where visitors may see, under actual working conditions, tractors and tractor-drawn implements belonging to all companies who care to expose their products to open comparison and criticism. All operations are conducted in the same field, so that it will be very easy for the onlooker to take plentiful notes on the different characteristics of each in action. There are to be no prizes or public awards of any sort; it rests solely with the observers to make their own decisions. Every afternoon there will be public demonstrations by all entries, while for those who are not satisfied with this general view, each exhibitor will give extensive private showings.

Running a close second to the demonstration in interest is the large exhibit. This will hold the interest of the farmer and his wife and daughters. There will be splendid displays from the various oil companies, as well as from the principal automobile and motor truck dealers, motor accessories, food products (which will be demonstrated daily), electrical motors and appliances, furniture and pianos, and numerous other articles.

This demonstration and exhibit should appeal to all ranchers and growers as a most profitable opportunity and pleasant way of spending a week. There will be a thoroughly equipped cafe on the grounds, where the visitors may procure excellent meals at a moderate price. The comfort of the women and children has been looked after in that there are to be fully equipped rest rooms.

The benefits to be derived from attending an affair of this kind cannot be too greatly estimated. In the first place one is given the chance of seeing the latest models of all tractors and tractor-drawn implements under the most critical working conditions. Then one is also able to get firsthand information from many farmers who are now employing tractors on their ranches, and conversation with these men is bound to bring up many points of interest that may be thoroughly discussed.

### CREAMERY CONVENTION AT PETALUMA

President Hopkins of the California Creamery Operators' Association, has been working very hard on the program for the annual convention which will be held in Petaluma October 4-6. A number of notable men in the creamery and dairy industry have accepted invitations to participate. Dean Van Norman of the university farm, C. F. Frevert, creamery specialist, and C. F. Doane, cheese specialist, both of the dairy division, United States department of agriculture, as well as a number of other experts, will be upon the program.

In order to add interest to the sessions and encourage discussion of the problems that confront creamery men a question box has been established. The box will be opened at a stated time at every session, the questions read and discussion encouraged. A great deal of attention has been

given to the social side of the convention. An auto ride through the hills and orchards of Sonoma County, including a visit to the home of Jack London and lunch at Carpenter Woods is one of the main attractions. It is hoped that there will be a liberal attendance of ladies.

### JERSEY SALE

An event of considerable importance in Jersey circles will occur this fall in the complete dispersal sale at Orland, California, Feed Stables of the Hermosa Vista Jersey herd owned by C. P. Hembree of Monmouth, Oregon. This herd is well known all over the West both for its high production and show ring winnings. For several years Mr. Hembree has won the lion's share of the ribbons at the California State Fair and his winnings at the P. P. I. E. are well remembered by California Jersey breeders.

A complete show herd will be shown by Mr. Hembree at Sacramento Fair next week and all will then get an opportunity to see the quality of the sale offering. The entire show herd will go in the sale which will occur at Orland on October 10. Further announcements concerning this sale will be made in the columns of this paper.

## Prepare for Fall Calving

By Ordering

### HOOD FARM BREEDING POWDER

In order that you may treat every cow after calving with this Powder. It is the most economical thing you can do, because it keeps cows in a normal, healthy breeding condition; makes them clean quickly; breed readily; there is less use of the bull, and little danger from abortion. You should also order

### HOOD FARM CALF SCOUR TREATMENT

consisting of Hood Farm Calf Scour Remedy and Hood Farm Digestive Powder. Include in the order

### HOOD FARM MILK FEVER OUTFIT

and

### HOOD FARM GARGET REMEDY

and you will be well prepared to meet the emergencies which frequently arise at calving time.

Prices, information and advice gladly given. Mention this paper.

C. I. HOOD Co., Lowell, Mass.

## Economy is Built Into Hardie Sprayers

Because they are dependable, cost less to operate and maintain, Hardie Sprayers are most economical. They last longer and give more continuous, uninterrupted service. This is proved by the thousands of Hardie Sprayers in orchards all over the country where they are saving time and labor and are helping to produce highest grade fruit.

Write for Hardie spray book today. It will tell of this modern, dependable sprayer. Examine it carefully. It will do every thing we say it will.

The Ideal Engine for Reliable Power. It has stood the test of years on spray rigs and cement mixers—the hardest jobs an engine can be put to. It is built by the Ideal Engine Company, who with R. E. Olds at its head, maintains the most superior design of any engine built.

We will be at the  
Sacramento State Fair

## Hardie Manufacturing Company

LOS ANGELES, CAL. and  
PORTLAND, ORE.

Classified Liners

The direct selling method from producer to consumer, and a clearing house for over 31,000 readers, weekly. Liner rates: Single insertions 3c per word; yearly contracts 2 1/2c per word. 35c per issue minimum charge.
